

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## TO OUR READERS.

— x —

A GLANCE at our past year, and a cheer towards the year we entered when this volume closed, have been contributed by two of our most welcome adjutants; so that a few sentences only are needed in addition.

To you who are especially devoted to the Garden we can promise an ample supply of able communications, and need add only the wish—

A gard'ner's new year to you : Due sunshine and rain ;  
No blight on your crops ; of rheumatics no pain.

To Poultry, Pigeon, and Cage Bird Fanciers we make a similar promise, for our staff is strong, and we wish

To all bird-lovers a happy new year,  
Few deaths 'mong the young, no eggs that are clear.

To you, Apiarians, the same promise applies, for here we have to be grateful for aid from the best skilled. So

A happy new year, Bee-men : much honey and good ;  
Stocks and swarms very strong, and not any foul brood.

Also Rabbit Fanciers and others who refer to our pages for information will find that we are always able to render satisfactory replies ; and this we are justified in saying, because we obtain them from men whom we know are sound in knowledge and judgment. To them, to you our readers, and to all our contributors we record our hearty thanks, for to you we owe our increased success, and enable us to say truly that we are proud of being

THE EDITORS.

From observations taken near London during forty-three years, the average day temperature of the week is 75.0°; and its night temperature 50.5°.

## HALF AN HOUR AMONG THE TEA ROSES.

AMONG the many merits of Tea Roses and Tea-scented Noisettes is their suitableness for covering walls high or low, and spaces of a few square feet or of a wide expanse, very small plants that are only a few months old and a foot or two in height yielding both foliage and flowers of much excellence, and which are quite as admirable and useful in their way as the older and larger plants, or rather trees, bearing perchance many hundreds of blooms. A single glance tells the experienced eye what position a new sort requires, all of delicate and slender growth being admirably adapted for clothing with beauty the base of walls that are usually left bare by the rampant growth of more vigorous kinds, as well as more prominent and favourable positions.

I have a collection of upwards of fifty kinds of this charming section of the Rose family all growing against walls and buildings, and planted in soil prepared for them with great care. Under these favourable conditions most of them have thriven very well, and when jotting down their leading characteristics lately for my own future guidance it occurred to me that my notes might interest and assist others in forming a correct idea of the relative merits and value of the various kinds, not so much as exhibition flowers as for the greater intrinsic worth of beauty in the expanding flower buds and foliage—points which are, I think, of even greater importance, certainly of greater utility than the production of fine large flowers. Some stress is laid upon this matter because it appears to receive very little notice; in fact I am by no means certain that in the rage for fine flowers it is not almost lost sight of. What say the rosarians? Do they plead “not guilty,” and claim that all their “gems and jewels rare” are of such invariable excellence in this respect that official notice is uncalled for? Of course it must be granted that there is beauty in every leaf and bud; but it is undoubtedly beauty in degree—good, better, best, and I suppose no one will attempt to question the importance of some classification.

Large numbers of Roses are cut and sent to town during the season; and this is one, but only a secondary, reason why I value beautiful flower buds and foliage so highly, for it is upon the growing plant that they are undoubtedly most attractive, and the estimate of those kinds which I have now to give is not based upon the appearance of a single flower or truss, but upon that of one or more plants of each.

Taking them in the order in which they are entered in the note-book, first of all comes that fine old Rose

*Gloire de Dijon*, alike excellent in bud, flower, and foliage. There are several seedlings of it, most of them partaking of its robust habit and fine foliage, but of inferior merit in other respects.

*President* has large buds and flowers; loose, dull-looking, and worthless.

*Safrano*.—Excellent in bud, and is then most useful

No. 744.—Vol. XXIX., NEW SERIES.

for bouquets; but the expanded flowers are thin, ragged, and so unsightly that it ought never to occupy a prominent position.

*Marechal Niel*.—Objection is sometimes taken to this magnificent Rose because its flowers are pendant; if it were of a dwarf bushy habit the objection might hold good; but in such a vigorous climber it is a decided merit and not a blemish at all. A fine specimen of it which was planted about three years and half ago is now quite 20 feet high, and has had upwards of three hundred flowers open at one time this year. The effect of such a mass of pendant golden flowers was as fine as it was singular; and what is perhaps more important in the eyes of many, they met with even more admiration when cut than when suspended upon the plant high overhead. I have about a dozen plants of this Rose trained to walls of different aspects and in open borders, and have always found the flowers of a higher colour upon a south aspect than in any other position. Of a robust, free, vigorous growth, with flowers and foliage of the highest excellence, and very free-flowering, it may justly be termed an indispensable sort, finding as prominent a position in the select few of an amateur's garden as it does among the thousands of the largest growers.

*Homère*.—This is variable in colour, but is usually of a pale salmon at the base of the petals, deepening outwards to a deep pink. The edges of the petals are beautifully recurved. It is a charming, distinct, and most useful variety.

*Isabella Sprunt* has nice little delicate yellow buds, which are useful; the expanded flowers are worthless. The effect of different aspects is strikingly exemplified in a plant of this sort, which is trained to a buttress. Upon the north and east sides the growth is stunted and weak, with puny worthless flower buds; while upon the south side the growth, foliage, and flower buds are as vigorous and fine as could be wished.

*Belle de Bordeaux*.—A vigorous but shy-flowering kind, hardly worthy of a place.

*Reine de Portugal*.—Fine large buds of a coppery hue, which as they unfold their broad elegant petals assume a rich yellow tinge. A fine Rose with handsome foliage, but apt to be petal-bound.

*Boule d'Or*.—Fine pale-yellow buds, deepening in colour as they expand into equally fine flowers.

*Marie Sisley*.—Fine, large, pendant buds, of a lovely pale pink colour. Foliage good.

*Madame Ducher*.—This has large buds of the *Gloire de Dijon* type, but paler in colour. It is a second-rate Rose, of a somewhat loose straggling habit of growth.

*Abricoté*.—Delicate fawn-coloured buds, exquisite in form, and which expand into large and tolerably full flowers. The pendant habit of its flowers renders it a desirable kind for training upon high walls or buildings. It has handsome foliage, and is altogether a fine Rose.

*Madame Caelina Noirey*.—A valuable sort, with abundant large delicate pink flowers, handsome foliage, and of a remarkably compact growth.

*Devoniensis*.—Magnificent buds and flowers of a pale

No. 1898.—Vol. LIV., OLD SERIES.

yellow shade of colour. The dwarf growth is clothed with handsome foliage. A fine Rose.

*Viscomtesse de Cazes*.—Useless for bouquets owing to the looseness of the flowers, but so rich in colour—a bright golden yellow—as to merit a place.

*Madame Levet*.—This is another kind with thin loose flowers of bad form. It is a free-blooming kind, but unworthy of wall space.

*Rubens*.—Buds of medium size, yellowish white, with a charming pink tinge; elegant recurved petals. A fine Rose, with handsome foliage.

*Madame Bravy*.—A delicate kind, of little merit.

*Hortensia*.—Another delicate kind, but with fine, large, rosy-pink flowers. An excellent variety.

*Triomphe de Luxembourg*.—This has rose-coloured flowers, tinged with copper. The buds are good. Growth of medium vigour.

*Narcisse*.—Flowers white, with a charming yellow tinge. The exquisite form and delicate colour of its buds render this a most desirable kind.

*Madame Azélie Imbert*.—Pretty little cream-coloured buds, which are very useful; but like its parent *Madame Falcot*, its expanded flowers are worthless.

*Souvenir d'un Ami*.—This fine old Rose still holds its own, and is worthy of a prominent position. It has beautiful flowers, full, and of a charming pink colour.

*Madame Margottin*.—The yellow flower buds of this kind are good, and the foliage handsome, but the expanded flowers are worthless.

*Madame Falcot*.—Buds of exquisite form of a deep fawn colour. Somewhat resembling *Safrano*, but infinitely superior to it.

*Madame Hippolyte Jamain*.—A very free-flowering kind, but unworthy of wall space.

*Monsieur Furtado*.—Pretty flower buds of a delicate yellow shade.

*Madame Melanie Willermoz*.—Large creamy white flowers tinged with pink of the *Gloire de Dijon* type. It is an excellent kind, vigorous in growth and very free-flowering. A fine Rose.

*Goubault*.—A vigorous free-flowering, deep-flesh-coloured old Rose, valuable for its buds, which are fine in form and distinct in colour.

*Niphotos*.—An excellent large white kind; the flowers are pendant, full, and well formed.

*Jean Pernet*.—This is an excellent variety, bearing well-formed flowers, full, and of a delicate pleasing shade of yellow. The flower buds are very useful.

*Sombreuil*.—A white kind with a delicate pink tinge, very good and well-shaped flowers, of vigorous growth, with fine foliage, and excellent in every respect.

*Duc de Magenta*.—A free-flowering kind, with nice useful buds and flowers of a novel yellow and pink tinge.

*Lamarque à fleurs jaunes*.—The opening buds of this variety reveal a charming interior of rich bright yellow. They are exquisite in form, yet they, like so many others, expand into comparatively worthless flowers. It has handsome foliage, and is quite indispensable for its buds, which are really unique.

*Comte de Paris* has pretty pale pink flowers. The buds are useful.

*Perte de Lyon*.—This is so delicate with me that I am quite unable to form an estimate of its worth. I shall be glad to learn more about it from others.

*Montplaisir*.—This is another of the *Gloire de Dijon* strain, having large flowers, but wanting delicacy and refinement both in the form and texture of its flowers.

*Belle Lyonnaise* is also a seedling of the prolific *Gloire de Dijon*. Its flowers, of a deep canary yellow, are full and well-formed.

*Belle Maconnaise*.—The flowers of this kind are so decidedly inferior in every respect that I shall discard it.

*Adrienne Christophe*.—A novel kind, with very high-coloured flowers of a rich coppery yellow, and with a pink centre. It is worthy of a place.

*Bouton d'Or*.—This has charming little bright yellow flower buds, which are very useful. It is a valuable dwarf-growing kind.

*Victor Pulliat*.—The flowers of this are of the most paltry description—loose, ragged, and thin; they are without a single redeeming point even under the best culture and in a warm sheltered position.

*Climbing Devoniensis*.—This is a splendid variety in every

respect. It is wonderfully vigorous, bearing its fine flowers of the true *Devoniensis* type most abundantly. The shoots of a small plant which was planted against a 10-feet wall between three and four years ago reached the top so quickly, and the entire plant was so vigorous, that it was transplanted to the south front of a building about 50 feet high; it has now attained a height of about 20 feet, and will probably cover the entire space allotted to it in course of two or three years more.

*Triomphe de Rennes*.—This has pretty little flowers of a delicate yellow shade, but is unworthy of a prominent position.

*Solfaterre*.—This fine old Rose requires a considerable share of wall-space to develop its full excellence. Its large, full, and well-formed flowers are of a delicate and most charming shade of yellow.—EDWARD LUCKHURST.

## BEES AND COTONEASTER MICROPHYLLA.

THOUGH not an apiarian I confess to be interested in the hive bee. I know of bees only outside their hives—nay, those I know now are not in hives, but have their domicile in the roof of a house. There are two colonies of them, one of very many years' standing, and the other came from a neighbouring apiary three years ago. The new comers sought entrance to the roof by the same opening as the old colony had; but though mighty in numbers they had to be content to take to the north side of the roof, the old one having an entrance at the southern side. Whether they fought for possession of the entire roof or location is not known, but that the new comers were satisfied may be inferred from the fact that they were very fractious for some days before they settled down, and until the old colony had cast off a swarm. What made me notice them particularly were their coming in great numbers and flying round the eaves of my cottage as if in quest of new quarters. Between it and their quarters the creatures maintained a string or line along some railings, reconnoitring slowly as they advanced from, but were less guarded or sped them swifter in returning to, quarters. So far as the railings went the bees followed them, and from where the railings turned at right angles they took a straight flight to and fro to the roof. Pugnacious were they, making attacks on all approaching near their road of march. They searched the roof thoroughly all round, and finally returned to head quarters, where they have remained in quiet ever since, not casting a swarm that I know of. Whether the new comers are responsible for a swarm that found its way to the roof of a lodge about half a mile distant I shall not speculate upon, or whether they are the instigators of the spies which have lately been seen busy round the eaves of the said lodge, and intend invasion at a not distant date, may not be as clearly shown as to carry with it the force of conviction; but that runaway bees know beforehand whither they are bound at the outset seems clear from their straight flight to the settlement. It is not a hovering around the old habitation, and settling upon branches near, but a clear case of mind made-up beforehand, requiring only at the juncture to be acted on.

The finding of runaway swarms on branches of trees is no proof that search has not been made for a domicile before the exodus, for it may be the queen is unequal to the task, and settles where she does of fatigue, surrounded by her clamorous subjects. Is it proven that a swarm so left would perish, and not after a halt renew the journey? Failing this, would the bees not return to whence they came out, minus it may be the queen? And what would be the good of continuing the journey if the essential of their existence were not capable of reaching the destination marked for the new colony? It would be a mercy to dispatch the queen and return to their old friends, or both may return together. Anywise it seems to me (excuse my knowledge of bee-ology) contrary to the philosophy of nature and instinct for a swarm of bees to be driven out or of its own accord leave a hive, not knowing whither it is bound, or without means instinctive of selecting one. Can it be that the "cultivated" bee is so accustomed to have its habitation provided as to lose the instinct peculiar to it in a wild state in providing itself with a domicile? and are not runaway bees evidence of the full returning of their instinctive power?—a return from the cultivated to the natural state.

Bees, runaway or home, how fond they are of the flowers of the *Cotoneaster microphylla*. Every flower seems to be possessed by a bee, and humble bees are also busy in sharing in the sweets. Upon no shrub or plant have I noticed the bees so busy as upon the flowers of this. *Salvia nemorosa* and *Heather* (*Calluna vulgaris*) are no exceptions, but they flower

later; *Nepeta Mussini*, an effective lavender-mauve flower plant for borders, being a good foraging ground for bees.

The *Cotoneaster* is a quick-growing evergreen shrub, and though the leaves are small the growth is so dense and close as to give a carpet of deep shining green to rock, and rugged ground, whilst for walls it clothes them in a close green mantle, be they old or new, and for low walls up to those of a dozen feet or more it is, for a close covering, perhaps matchless. The flowers are white, and only from their number are significant of the following of the bright red berries, appearing to great advantage—coral beads upon the brightest and deepest of emerald setting; against the walls of a church it is a fitting subject, according well at the festive season with the decorated interior.

Rugged and sloping banks after the plants become established are covered by it speedily and effectively, and though it has been recommended as good for growing under trees, my experience appears to point to only partial success. It is not either suited to a position very bleak or exposed, as the growths are cut by severe weather, especially if the ground be rich and the growths consequently strong and unripe. With moderate shelter, however, it succeeds admirably.

*C. buxifolia* has rounder leaves, is of more glaucous aspect, and is not nearly so good or free-growing as *C. microphylla*; and *C. Simmonsi*, which was vaunted upon its production as a berry-bearing shrub, is certainly very free in growth, of stiff and erect habit, of no use whatever as an evergreen covering for walls, being at best only a semi-evergreen, losing a majority of its leaves in winter; but it bears a profusion of bright orange-red berries, which are very pretty and useful for decorative purposes at the dreary season.—G. ABBEY.

## ALEXANDRA PALACE ROSE SHOW.

JUNE 24TH.

A PERIOD of showery weather followed by a week of dull yet dry days has aided the production of splendid Roses. The rains supported the plants, and the cloudy days intensified the colours of the flowers, and a perfect show-day enabled them to be set-up in large numbers, and many of them of a high order of merit. The first Alexandra Show was great not only in name but in fact. The great Rose champions entered the lists and marshalled their forces in such numbers as almost to overtax the energies of the managers, but by dint of hard work the arrangements were just completed in time for the public inspection. It is indeed little short of a marvel, considering the distance the collections have to be brought, and the utter dependence on trains not always punctual, that flowers can be staged in such numbers and freshness as are found at any exhibition of note. It is only by untiring devotion and unremitting work that an exhibition such as this can be perfected, and the Rose-loving world should recognise the efforts and appreciate the labours to all who contribute to a successful display.

A comprehensive schedule and liberal prizes met a general response of rosarians. At this first Show thousands of blooms were staged, and thousands of visitors were attracted, yet on the first day the numbers were more select than numerous.

As is to be expected in such a large number, many blooms were small and indifferent, but still more were exceedingly fine. As a rule the collections were too fully expanded, and had just passed the prime of the full gloss and freshness of youth. Some of the exhibitors were sensible of this, and wisely kept their blooms covered until the last moment. The Judges were sensible of it too, and did not always award primary honours to the largest blooms, but evidently and justly gave full weight to freshness, colour, and uniformity. Roses are never so beautiful as just before they are fully expanded, and mere size does not, neither ought it to, carry the palm. We note this because the weak point of the Exhibition—and it is a common if not a growing weakness—was that a majority of the blooms were too far advanced. Two-days shows have frequently a ragged appearance on the second day, by paying undue honour to mere size of blooms on the first. The correctness of the judgment will, in most instances, in this Show, we think, be as clearly seen on the second day as at the time the awards were made, and that is no mean proof that quality has been recognised as well as size.

In glancing at the classes we shall not append a long string of names, as it is only repeating John Hopper, Charles Lefebvre, Mme. La Baronne de Rothschild, Alfred Colomb, La France, &c., over again. Such Roses are always good, and are constant and sterling varieties indispensable in all collections. In the six exhibits in the nurserymen's class for seventy-two single trusses the above were all represented in fine order. Messrs. Paul and Son, Cheshunt, secured first honours with an even lot, combining size, substance, and colour. Amongst them Duke of Connaught, Duc de Rohan, Eugénie Verdier, and Marie Bau-

mann shone pre-eminent. Messrs. Cranston & Mayos were second with equally large blooms of nearly the same varieties, but not quite so bright and fresh as the Cheshunt Roses. Mr. Cant, Colchester, was third with smaller but particularly fresh blooms. In this collection Emile Hausburgh was lovely. Than this no more charming flower was in the Exhibition. Louis Van Houtte was also intensely coloured, and Niphetos was shown in faultless beauty. Mr. Turner was placed fourth. An extra prize was awarded to Mr. Keynes, Salisbury, for a collection of considerable merit. In this class the bloom were the finest in the Exhibition. More imposing, however, was the following class for forty-eight varieties, of each three trusses (five competitors). Here Mr. Turner, Slough, was in the ascendant, securing first honours with blooms nearly equal to those in class 1. Maréchal Niel, Maurice Bernardin, Madame Eugénie Verdier, and Etienne Levat were amongst the best. Paul & Son were second with La France (splendid), Senateur Vaisse (very bright), Charles Rouillard, François Michelin, &c.; Mr. Keynes being third, his Devonensis and Marquise de Castellane being the most effective. Mr. Cant was fourth; an extra going to Messrs. Cranston & Mayos for blooms only a shade inferior to those of their great rivals.

In the class for twenty-four triplets of Hybrid Perpetuals were ten competitors. It was a massive display, Messrs. Paul & Son having the premier place with blooms almost perfect in form and colour, but not very large. Madame Lacharme was here very good; and very fine were La Ville de St. Denis, Louis Van Houtte, Marie Baumann, and Madame Hippolyte Jamain. Mr. Prince, Oxford, was second with blooms of great substance, Messrs. Cranston & Mayos being third, and Mr. Turner fourth. In the next class, for twenty-four single blooms, eight fine boxes were staged, Mr. Keynes winning with a level lot of great excellence, Messrs. Cranston & Mayos and Mr. Prince following in the order named; equal fourth being awarded to Messrs. Davison and Whitten, Hereford, and Mr. Cant. The best blooms in these collections, besides the old standards, were Etienne Levat, Mad. Hippolyte Jamain, Exposition de Brie, Catherine Mermet, Xavier Olibo, Dr. Andry, Fisher Holmes, Marie Baumann, Marquise de Mortemart, Princess Beatrice, Horace Vernet, Louis Van Houtte, Marguerite de St. Amand, and François Michelin.

In the nurserymen's class for Tea-scented and Noisette Roses were six competitors, and some charming flowers were staged; Messrs. Paul & Son winning a close race, followed by Mr. Prince and Mr. Cant in the order named, Messrs. Davison & Whitten being fourth; Mr. Keynes having an extra prize. In the corresponding class for amateurs the Rev. J. B. M. Camm was first, followed by Captain Christy, T. Laxton, Esq., Stamford, and Mr. Pullen, gardener to E. Smith, Esq., Colney Hatch. These charming Roses afforded a refreshing relief to the Hybrid Perpetual classes, and had many admirers. The best were Maréchal Niel, Anna Ollivier, Madame Willermos, Niphetos, Catherine Mermet, Devonensis, Souvenir de Paul Neron, Gloire de Bordeaux, Marie Van Houtte, Belle Lyonnaise, Madame Capucine, Alba Rosea, Souvenir d'un Ami, Souvenir d'Elise, Celine Forestier, Adam, President, Mr. Kemble, Mons. Furtado, Josephine Malton, Rêve d'Or, and Homère.

In the remainder of the amateurs' classes was good competition. For forty-eight single trusses Mr. Baker, Heavitree, Exeter, won the first honours with a very fine collection. Some of the best were Marie Van Houtte, Marie Baumann, Annie Laxton, François Michelin, Duchesse de Caylus, Beauty of Waltham, and Centifolia Rosea. The other awards going to Miss Penrice, Norwich; Mr. Rushmore, gardener to Sir C. Rowley, Bart., Tending Hall, Colchester, and Mr. Laxton. For thirty-six blooms eleven competed, Mr. Baker being again in the ascendant; Mr. Curtis, Chatteris, Mr. Cavell, Oxford, and Mr. Mayo following in the order named; Mr. Camm having an extra prize. In the class for twenty-four blooms seventeen competed, and the awards were made in the following order—Mr. Atkinson, Brentwood; Mr. A. J. Bloxham, Oxford; Mr. T. Jowitt, Hereford; Mr. Curtis and Mr. Baker, equal fourth; and an extra to Mr. Mayo. In these collections many inferior blooms were placed, but the winning stands contained fine examples of standard varieties; Beauty of Waltham, Henri Ledechaux, Paul Verdier, Marquise de Castellane, Annie Laxton, and Etienne Levat showing to advantage. In the class for twelve were eighteen collections of superior quality, Mr. Baker being placed first; Rev. A. Chales, Reigate, and Mr. Taylor, Oxford, equal second; Mr. Smallbones third; Mr. Gravely fourth; an extra award being given to Mr. Mayo.

The open classes were specially interesting, and brought out some fine Roses. For twelve blooms of 1873, 1874, or 1875 Mr. Turner secured the first place. He had very fine examples of Beauty of Slough, Dean of Windsor, Caroline Kuster, Mr. Baker, Capitaine Christy, J. S. Mill, &c.; second honours going to Messrs. Paul & Son, who had amongst their finest Duchess of Edinburgh, Mlle. Marie Finger, Reynolds Hole, and Etienne Levat. Mr. Cant had third place, his best being William Hayes, Etienne Dupuy, Madame Lacharme, and Antoine Mouton of a very pleasing lavender tint; Mr. Keynes being placed fourth. For

six trusses of any Rose of 1873, 1874, or 1875 Messrs. Cranston and Sons won with Sir Garnet Wolseley. It is one of the best Roses ever set up, rich, deep, full, and grand. Messrs. Paul and Son had second place with their distinct and good variety Cheshunt Hybrid, followed by Mr. Corp, Oxford, and Messrs. Davison & Whitten with Capitaine Christie. For eighteen trusses of English-raised Roses in commerce Mr. Turner and Messrs. Paul & Son were first and second respectively. The best were John Hopper, Rev. J. B. M. Camm, Miss Hassard, Wilson Saunders, and Lord Napier. In the open class for twelve single blooms Mr. Walker, Thame, Oxon, won with the best box of blooms in the Exhibition; Mr. Keynes being second, Mr. Turner third, and Messrs. Corp and Prince equal fourth.

We now come to the classes for twelve blooms each of nine special varieties, which resulted in a rich display; and it is likely that this mode of showing popular Roses will become more general. It would have been complete if a champion prize had been added to the best box in the Show. Of Alfred Colomb four collections were entered, the honours being apportioned to Mr. Turner, Mr. Baker, and Messrs. Paul & Son respectively. For Duke of Edinburgh, Messrs. Paul & Son and Mr. Turner shared the awards. For Mme. La Baronne de Rothschild (splendid blooms), Mr. Baker and Mr. Prince were winners. For La France, Mr. Baker was again first, closely followed by Messrs. Paul & Son with grand collections. For Marie Baumann, Mr. Curtis and Mr. Baker were placed in the order named, with handsome stands. For Maréchal Niel, Mr. Cant was first and Mr. Walker second. For Princess Beatrice, Mr. House, Peterborough, and Messrs. Paul & Son. For Edward Morren, Mr. House and Mr. Cant; and for Madame Lacharme, Mr. Cant was first and Messrs. Paul & Son second.

What shall we say of this controversial Rose? "D., Deal," is right in calling it good, and Mr. Camm is right in calling it indifferent. How can this be? As a white Rose, when well finished it is the best of all. Good examples of it were shown, but many more were indifferent both in size, form, and purity of colour, and the plants exhibited were infested with mildew. It is good when well grown; so "D., Deal," is right, but is evidently anything but a constant and good grower, which affords Mr. Camm room for complaint; besides it is scentless, or worse, and hence that rosarian cannot esteem it of the highest merit. Madame Lacharme must be grown, and those who produce perfect blooms will have reason to be proud of them. That is the teaching of the Alexandra Show to an unprejudiced and impartial mind.

For fifty pot Roses Messrs. Paul & Son had the post of honour, Mr. Turner's plants being nearly as good. For standards there was no entry. For vases of Roses Miss Money of the Alexandra Palace had the first prize; Mr. Gardiner, gardener to Lady Garnier, being second. Certificates were awarded to Mr. Laxton for Mrs. Laxton, a beautiful Rose with the form of Marie Baumann and the colour of Sénateur Vaisse; and for Emily Laxton of the type of Marquise de Castellane, but richer in colour. Mr. Laxton also exhibited Dr. Hogg, a rich claret, with good substance. Mr. Turner had certificates for Mrs. Baker, a flat-petalled velvety Rose; and Oxonian, a globular flower of great substance, a deep rose-coloured Princess Beatrice. Mr. W. Paul exhibited new seedling Roses of great promise.

Mr. Turner had certificates for finely-laced Pinks and plants of new Pelargoniums. A batch of Gloxinias of merit were exhibited by the Alexandra Palace Company, four of which were certificated. Certificates were also awarded to Mr. Ware for a double Sweet William; and to Messrs. Barron & Son for Cupressus Lawsoniana elegantissima and Retinospora tetragona aurea. Miss Williams, Holloway, had elegantly arranged groups of flowers. Mr. Williams had first prize for a large collection of plants, and Mr. Turner second; and the hall was made gay with large and well-filled vases of flowering plants and Ferns.

Altogether the first Rose Show was a successful one, and with the experience it has afforded is no doubt but the precursor of others still better, especially in some details of arrangement which the Exhibition would suggest to the intelligence of the managers.

### ROYAL HORTICULTURAL SOCIETY.

THE following requisition signed by more than twelve Fellows of the Royal Horticultural Society having been presented to the Council, in accordance with the bye-laws, a special General Meeting is hereby called for Thursday, July 8th, at 8 o'clock p.m., in the Council-room of the Society, at South Kensington.—ROBERT HOOG, *Secretary*.

"We, the undersigned Fellows of the Royal Horticultural Society, respectfully request the Council of the said Society to summon a general meeting of the Fellows with as little delay as possible, to consider the conduct of Lord Bury, Sir Coutts Lindsay, Messrs. Bonamy Dobree and Burnley Hume, in reference to the non-completion of their resignations, and other

matters that it may be deemed necessary to introduce to the notice of the Meeting under the head of acts and doings of the afore-mentioned gentlemen during and in connection with their membership of the Council.

"Also for the purpose of conferring with the Council as to the steps that should be taken to extricate the Society from the difficulties under which it is placed from the obstructive position assumed by Lord Bury, Sir Coutts Lindsay, Messrs. Bonamy Dobree and Burnley Hume, in the non-completion of their resignations."

### CRYSTAL PALACE ROSE SHOW.

JUNE 28TH.

No sooner is one great tournament over on the north of the metropolis than another, if not greater, yet in most respects better, is arranged—where so many fine gatherings have been seen before—in the great Palace at Sydenham. Rose shows are unlike plant exhibitions in one important respect (although there is necessarily a great similarity in the nature of the exhibits), that the identical prize-winners are not transferred from one place to another in precisely the same state and with exactly the same results. If in the case of Roses we have just the same exhibitors and much the same order of success, we have undoubtedly different flowers from those which have been previously seen and described.

The two great gatherings described this week are distinct in the essential points of quality of blooms and their order of arrangement. It is but just to note that the Crystal Palace arrangements have fairly carried the palm for efficiency, and it is serviceable to others to know wherein this efficiency consisted. That blooms are produced in better condition at one place than another is beyond the pale of official management; but not so the arrangements in conducting the show. In the parallel rows of boxes arranged under the awning in the central transept at Sydenham, the Roses showed to greater advantage than in the widely separated and lofty aisles of the Concert Hall at Muswell Hill. They were arranged with more smoothness, judged with more ease, and enjoyed with more comfort at the Crystal Palace than at the Alexandra Palace; and further, the system is altogether simpler and better to have each exhibitor represented by name on his card rather than by number. These cards at Sydenham are simply turned face downwards, and the class number written at the back, and are not turned up until the decision is arrived at, and for the ready printed slips of "first," "second," and "third prizes," to be pasted on their face. For celerity, fairness, simplicity, and efficiency the plan is commendable. If honour exists in any body of men it is in the judges of Roses, and any special precautions to ensure perfect justice being done is quite needless. It may be useful to mention this plan, which works so perfectly, as being preferable to the blind ticketing of the collections with numbers alone, and for the corresponding names of which the public must wait with the impatience that under the circumstances is inevitable.

But to the Show. It was one of the largest ever held, and one of the best. The collections were arranged on two tables, the boxes facing each side. If in a single line they would have reached 1170 yards, or nearly two-thirds of a mile. In quality the blooms were generally very superior; to lose in such a contest was no dishonour, but to win was indeed a triumph. We have seen larger blooms, but for colour and freshness they have never, perhaps, been excelled. The dull morning retarding their expansion was an advantage, and the rich appearance of such blooms over a large collection fully expanded was very manifest. We name a very few of the best in the classes on the principle that the shorter the roll of names the more select is the list of varieties. In the nurserymen's class for seventy-two varieties of single blooms were six competitors, each staging collections of sterling merit. "What! Messrs. Paul & Son first again?" was the greeting. Yes, the Cheshunt Roses were the largest, and also equal in colour and finish to those of their great rivals, and hence they won. A very noteworthy Rose in this collection was John Bright, not, however, clothed in the sober garb of the quakers, but rather in the brilliant colour of the life-guardsmen. It is a rich and glowing variety. In contrast was a bloom of rare excellence of Madame Rivers, and of equal high quality were Madame G. Schwartz, Duchesse de Morny, Alfred Colomb (very brilliant), Marguerite de St. Amand, and Mons. Noman. Mr. Turner, Slough, was second, Mr. Cant third; an extra third going to Messrs. Cranston & Mayes. The best blooms were Horace Vernet, Duchesse de Caylus, Dr. Andry, Xavier Olibo, Duke of Wellington, Annie Laxton, Madame Bellon, Madame Vidot, Elie Morel, Sénateur Vaisse, Océide de Chabillant, Souvenir d'Elise, Dupuy-Jamain, Marquise de Gibot, Niphetos (splendidly shown in the collection), Charles Lefebvre, François Michelon, and Marie Baumann; and in Mr. Keynes's collection a very good Madame Lacharme. The above collections were nearly equal in point of merit, but the beautiful foliage of Mr. Turner's Roses turned the scale in his favour.

For three trusses of each of forty-eight varieties were also six fine collections; Mr. Cant having first honours with a grand lot of blooms; Messrs. Paul & Son and Mr. Keynes being equal second, and Mr. Turner third. The most perfect triplets were La France, Mlle. Marie Finger, Mlle. Marie Cointet, Ferdinand de Lesseps, Louis Van Houtte, Madame Hippolyte Jamin, Madame Sertot, Niphotos, Etienne Levat, Princess Beatrice, Madame C. Wood, La Fontaine, Dr. Andry, Marie Baumann, Louisa Wood, François Louvat, J. S. Mill, Victor Verdier, Marquise de Castellane, Rêve d'Or, Abel Grand, Mad. Lacharme very good, and Lamarque in splendid form. In the class for twenty-four varieties of three trusses of each were six excellent collections, Mr. Prince, Oxford, winning with blooms of fine substance of petal and in perfect form and colour, the seedling Briar adding one more to a long list of honours. Mr. Keynes was second, and Mr. Bennett of Stapleford third. Mr. Prince had amongst his list Madame Lacharme (stick to it "D., Deal"), François Michelon, Marquise de Castellane, Etienne Levat, Charles Lefebvre, Madame G. Schwartz, and Marie Baumann. Mr. Cant also set up a grand lot, his Duke of Wellington, Duchesse de Morny, and Niphotos being the best of these fine varieties in the Exhibition. The class for twenty-four single blooms brought out fine collections, amongst them were superior blooms of the varieties above named. Mr. Cooling, Broad Street, Bath, securing the post of honour; Mr. J. Walters, Mount Radnor Nursery, Exeter, being placed second; and Mr. Walker, Thame, and Mr. Corp, Oxford, equal third, an extra third being awarded to Mr. Coppin, Shirley, Croydon.

In the amateurs' classes was spirited competition, and many grand flowers were set up. For forty-eight varieties, single trusses, Mr. Baker, Heavitree, distancing all comers. The Heavitree Roses must have the benefit of heavy soil, for they are heavy blooms of splendid finish. Finer examples of Marie Van Houtte (lovely), Devonensis, Prince Camille Bernardin, Dr. Andry, Alfred Colomb, Annie Wood, Souvenir d'Elise Vardon, Duchesse de Caylus, Exposition de Brie, Louis Van Houtte, and Devienne Lamy have seldom been seen. Mr. R. Draycott, gardener to Sir C. Cunard, Bart., Hallaton Hall, Leicester, was second; Mr. W. Nichol, gardener to J. H. Powell, Esq., Drinkstone Park, Bury St. Edmunds, third; Mr. Pearce, gardener to Prof. Adams, The Observatory, Cambridge, and the Rev. T. H. Gould, Mortimer Vicarage, Reading, having extra awards. There were ten competitors, the winning stands being highly creditable to the growers, but in the rest were many small blooms. For thirty-six single blooms fifteen competed, Mr. Baker being again first with perfect blooms; Mr. J. Mayo, Oxford, being second; Mr. Draycott third; an extra award being awarded Mr. J. Davis, Wilton, Salisbury. Mr. Baker had a charming Marie Van Houtte; Lord Macaulay and Prince de Portia were especially brilliant, and Eugénie Verdier, Louis Van Houtte, and Etienne Levat being very fine. Mr. Robson, Sunningdale, Torquay, staged an admirable collection of fresh handsome blooms. For twenty-four single blooms no less than twenty-three competed. The flowers were perhaps generally small, but beautifully fresh and well coloured. They embraced as the best the varieties above named. The awards were given in the following order:—Mr. Baker, Mr. Atkinson, Brentwood, and Mr. J. C. Quennell, Brentwood; extra thirds being awarded Mr. Nichol, gardener to F. H. Powell, Esq., Drinkstone Park, Bury St. Edmunds, and Mr. L. Curtis, Chatteris. For twelve blooms were staged eighteen very fine collections, Miss Anne Lloyd, Exeter, being placed first; Mr. Smallbones, Chatteris, second; Mr. Atkins, Halstead Place, Sevenoaks, and Mr. Cavell, Bardwell Villa, Oxford, equal third; extra awards being made to Mr. John Tranter, Upper Assenden, Henley-on-Thames, and Mr. G. P. Charter, Brentwood. As a rule the blooms in this class were very superior, the whole of the exhibitors contributing well.

The open classes for new Roses always possess primary interest. For twelve blooms of any new variety of 1878 there were six competitors, Mr. Bennett, Stapleford, achieving the post of honour with a grand collection of charming blooms of Mlle. Marie Cointet. These had size, form, colour, and freshness; Paul & Son being second with rich blooms of their distinct and valuable Rose Oshesunt Hybrid; Mr. Turner having third place, also with the same variety. Two collections of Madame Lacharme competed, but they did not merit any award. This is a Rose which no one can afford to exclude from their collections, although as a rule it was exhibited flimsy in the petals, and quite half of the blooms were slightly tinged. It probably requires a vigorous stock. The best bloom in the Show, and it was not perfect, was in Mr. Prince's collection, and grown on the seedling Briar.

In Class 10, for twenty-four varieties, single blooms, of 1872 and 1878, were collections of great merit. Messrs. Paul & Son won the premier award in this class, the best being Emile Dupuy, John Bright, fiery; Duke of Connaught, very rich; François Courtin, Emily Laxton, Mlle. Marie Finger, Thos. Mills, Empress of India, Madame Lacharme, good bloom; Capitaine Christy, Kleber, Peach Blossom, Etienne Levat,

Claude Levat, Madame Dumaine, and Maréchal MacMahon. Mr. John Durbin, English Coombe Rosery, Bath, was second; and Mr. Keynes third.

Class 11, for twelve blooms of any variety of Rose, brought out a rich display of standard sorts. The premier award was worthily won by Mr. Bennett, Stapleford, with Mlle. Marie Cointet. This is a grand Rose, set up in fine style. It is of full size, with shell-like imbricated petals of rosy-peach colour, with a fine satiny gloss suffusing every part of the blooms. It is a Rose of undeniable excellence, and will enrich the most select collection. An extra first prize was awarded to Mr. Cant for massive blooms of Souvenir d'Elise. Mr. Mobsby, gardener, Colewood House, Sussex, and Mr. Baker, Heavitree, were placed equal second with Maréchal Niel and Mme. La Baronne de Rothschild respectively; Mr. Prince, Oxford, being placed third with Marquise de Castellane; an extra third being awarded to Mr. Turner, Slough, for Marie Baumann. The above were very superior collections, and in the same class Horace Vernet, Madame C. Wood, Abbé Bramet, Beauty of Waltham, John Hopper, Charles Lefebvre, François Michelon, and Marguerite de St. Amand were worthy associates. In this class were twenty-three competitors.

The awards for yellow Roses went in the following order: To Messrs. Paul & Son, Mr. Cant, and Mr. Walker. They were generally too much expanded, excepting Triomphe de Rennes and Boule d'Or, and these were in a beautiful half-open state. The rest were Maréchal Niel, Adrienne Christophle, Gloire de Dijon, and Céline Forestier.

For the best-arranged vase or epergne Miss Alice Hyder, St. Mary's Cray, was placed first. It was a simple graceful combination of Roses, Campanulas, and Ferns. Perhaps equally beautiful but more flowery was the one from Mr. Soder, gardener to O. Hanbury, Esq., Weald Hall, which had the second prize; Mr. Chard, Clarendon Park, being placed third with a vase too highly coloured. For Fern cases furnished, Messrs. Dick Radcliffe & Co., 129, High Holborn, were first; Mr. W. O. Garford, Springfield Nursery, Wandsworth Road, having the second place. The third prize was withheld.

In the classes for table decorations was considerable competition. In the open class Mr. Buster, St. Mary's Cray, was placed first; Mrs. W. Seale, London Road, Sevenoaks, second; and Mr. James Hudson, Champion Hill, Dulwich, third. Mr. Buster's table contained five tall glass vases filled principally with Grasses, flowers being very sparingly used. It was light, cool, and free. Mrs. Seale's was more gay, and by many considered the most beautiful; Mr. Hudson's being too heavy. The Judges have given their verdict in favour of elegance and grace as against highly-coloured embellishment, and we think thereby they have judged rightly. In the amateurs' class Mr. Hudson was first; he had as centres three Palms, with bases of flowers. Mr. Soder, gardener to O. Hanbury, Esq., being second with elegantly-arranged vases; Mr. Chard being third with Palms and flowers too heavily grouped. In the ladies' class Mrs. Seale was first, Mrs. Sarah Hudson second, and Miss Edith Blair, 50, Upper Bedford Place, London, third. In these decorations blue flowers predominated, which for daylight dinners are permissible, but for gaslight objectionable. The flowers consisted mainly of Campanulas, Water Lilies, and Cactuses. Most of the work in these classes was overdone.

For wedding bouquets Mr. Wood, High Street, Sydenham, was first with far the best bouquet in the Exhibition. It was composed of white Odontogloss, Roses, Utricularias, and Ferns, with a central spray of Spiræa japonica. Mr. Hepburn, Crystal Palace, was second. For opera bouquets Mr. Hepburn was first and Mr. Hudson second. For button-hole bouquets Mr. Hepburn was first with a yellow Rose bud, a sprig of Bouvardia, and Ferns; Mr. Burley, Brentwood, having the second award.

In the miscellaneous class prizes were awarded to Mr. Hooper, Vine Nursery, Bath, for Pyrethrums, Pansies, and Pinks; to Mr. Hepburn for a collection of button-hole bouquets; and to Mr. Corp, Oxford, for charming boxes of Tea-scented Roses. First-class certificates were awarded to the following:—Mr. John Durbin for seedling Rose Lady Mary Keith, Mr. Laxton for Mrs. Laxton and Lady Isabel Cecil, Messrs. Paul & Son, Cheshunt, for Duke of Connaught and John Bright, Mr. Postans for an unnamed seedling, and Mr. Turner for seedling Rose Oxonian and seedling Pink Bolard.

Messrs. Carter & Co. exhibited highly coloured Coleuses, the best being Duchess of Edinburgh, Mandarin, and The Shah—a trio of considerable value. Mr. Thompson, of the Crystal Palace Company, furnished attractive decorative plants and cut blooms in fifty varieties of Dianthus chinensis vars. Heddewigigil and laciniatus from seed supplied by Messrs. Sutton & Sons: these were of fine quality and remarkable richness, and greatly admired. The Exhibition was good and admirably conducted, and the Palace grounds are now attractive and in a high state of keeping.

LATE APPLES.—One of your correspondents inquired about late-keeping Apples. Since I have commenced writing I have

been to the cellar and brought up my last; they are the Sussex Duck's Bill, or Winter Queening, a very good Apple both to cook and eat. They are of medium size.—G. C.

### NEW DISEASE OF POTATOES.

I SEE in your Journal communications, or warnings, of a new Potato disease. I am sorry to say that it has appeared in this district, as in my own cottage garden I have it, but mine are Paterson's Victorias. They are affected exactly as the Rev. Mr. Berkeley says, and I have been told of others in the same way, and I am afraid that if it grows worse there will be no Potatoes where it is at all, whereas in other years there have been abundant crops.—G. C.

I WIND Early Rose to have nearly escaped; perhaps one haulm in a dozen gone, but the rest have a somewhat suspicious appearance on the leaf—dark yellow spots, which appear to increase, otherwise the haulm looks healthy. Bresee's Prolific is very bad, but seems to have been attacked at a later stage than you speak of at Chiswick. When the haulm had become more than half grown the leaves assumed a spotted burnt appearance, and are gradually leaving bare poles. These were planted early (beginning of March). Do you think that makes the difference? The seed was cut—a plan I am much against, but it was mostly composed of what Mr. Fenn styles "whoppers," but they were allowed to dry before planting.—O.

I HAVE grown the American Early Rose for five years, and it has always been affected in the way you describe, but this season it is so much so that I do not intend planting it again; fully one-third are gone. Othersorts, such as Wheeler's Milky White and Victoria, are sound.—S. WELLS, Osborne Park Gardens.

SEEING your announcement of a "new disease" amongst Potatoes, and the letters of Mr. Fenn and Mr. Douglas, and your own observations on the same, I feel it may be of some service if I state that it is not quite new here. My Early Rose Potatoes were affected to the extent of about one-eighth in the year 1872. In 1873 they were still worse. In 1874 they were not alone, as my Early Vermont, obtained of Messrs. Veitch, were affected too. This year the Early Rose, Vermont, and Late Rose are all affected, the latter the worst. Brownell's Beauty being alongside, but quite sound, as it was with me last year. I have about eleven other Americans, all at present sound; nor have I seen it in any of my English varieties, of which last year and this I grew upwards of fifty sorts. I have inspected many hundred gardens in this division, and find the disease affecting the same sorts only as my own. Whether the fungi are the cause or the effect is a problem for the horticultural doctors, which I hope will be solved.—C. W. HOWARD, Canterbury.

### ROYAL BOTANIC SOCIETY.

JUNE 30TH.

A SERIES of successful shows was brought to a close with this Exhibition, which was devoted to fruit and cut flowers. In neither department were the collections remarkable either for extent or uniform merit. We must speak of it as a small show, for several classes were empty; yet there was some good fruit. In the four classes for pot Vines Messrs. Lane & Son, Great Berkhamstead, were the only contributors with Foster's White Seedling, carrying about thirty bunches, and Buckland Sweetwater, with a fewer number of bunches but of better quality. For a collection of fruit there was no entry. In Pine Apples was scarcely any competition. For two Queens Mr. Brown, The Beeches, Weybridge, had the best, but nearly equal were those from Mr. Landford, gardener to the Earl of Beville. The fruits averaged about 4 lbs. weight. Mr. Ward, gardener to the Earl of Radnor, exhibited Providence of 9½ lbs.; Mr. Davies, gardener to W. Booker, Esq., Cardiff, had a large unripe fruit of the same kind; Mr. Douglas, gardener to F. Whitbourn, Esq., putting up a nice Charlotte Rothschild.

In the Grape classes very good fruit was staged. For baskets of 12 lbs. there were, in blacks, eight competitors. Mr. Ginnett, gardener to F. Wilmet, Esq., Isleworth, had Hamburgs, perfect in colour but not large; Mr. Bones, Mr. Douglas, Mr. Johnson, Mr. Bridgman, and Mr. Akehurst having collections of nearly equal merit. In the corresponding class for whites the best basket came from Mr. Douglas; Mr. Fiest, Mr. Bond, and Mr. Bannerman had also very good collections. For three bunches of Black Hamburg five lots competed, Mr. Johnson, Mr. Jackhurst, Mr. Douglas, and Mr. Sage each setting up good examples. Splendid Madresfield Courts came from Mr. Ginnett, and well-

finished Royal Ascoots from Mr. Douglas. For three bunches of Muscat of Alexandria Mr. Fiest sent highly-finished medium-sized bunches, Mr. Bannerman and Mr. Bond competing with larger and also good examples of culture. Other white Grapes were Buckland Sweetwater from Mr. Douglas, and Foster's White Seedling from Mr. Sage.

Peaches were very good. Bellegarde and Noblesse from Mr. Bones; Teton de Venus and Violette Hâtive from Mr. Johnson; and Royal George and Grosse Mignonne from Mr. Lake. Nectarines were also good. Elruge and Violette Hâtive from Mr. Lake; Downton and Violette Hâtive from Mr. Bannerman and Mr. Grant; and Violette Grosse and Elruge from Mr. Johnson.

Melons were few and very irregular in size. Mr. Coleman's Easton Castle, green flesh, was the best Melon in the exhibition. He had also Read's Scarlet Flesh. Mr. Harvey had a seedling and Duke of Edinburgh; Mr. Chard and Mr. Douglas also competed. In the class for the heaviest and best-shaped scarlet flesh, Duke of Edinburgh, oval, from Mr. Sage, weighed 7½ lbs.; Duke of Edinburgh, round, from Mr. Harvey, and a very nice netted fruit from Mr. Goldsmith, competed.

Very good black and red Cherries came from Mr. Musk; excellent whites—Elton and Bigarreau—from Mr. Douglas; and Governor Wood and Bigarreau from Mr. Chard. The only Plums we noticed were Prince Englebert and McLaughlin's Gage from Mr. Sage.

In the class for four dishes of Strawberries six very fine lots competed. Mr. Douglas had Due de Magenta, "Seedling," Amateur, and Admiral Dundas, all of good size and colour. Mr. Clarke had President, Sir J. Paxton, Dr. Hogg, and British Queen; Mr. Turner, Slough, had James Veitch, very large, and Leon de St. Janier; Mr. Meadows and Mr. Smith, Romford, had also capital dishes. Figs came from Mr. Sage, who had Brown Turkey very good, and Early Violet; Mr. Pottle competing with Brown Turkey and White Marcellines. In the class for any fruit not mentioned in the schedule Mr. Sage had a bunch of Musa Cavendishii weighing 80 lbs., in fine colour and uniformly ripe.

Roses were not extensively shown. In the nurserymen's classes Messrs. Turner, Paul & Son, Cant, Keynes, Fraser, and Bennett competed with the well-known popular varieties, Captain Christy and Mr. Chard being the principal amateur exhibitors. Captain Christy had a very good box of Madame Lecharme, and Mr. Cant another still better—indeed, the best we have seen of this variety. Besides these the most noticeable boxes were Devoniensis from Mr. Turner, and Niphotos from Mr. Keynes. Mr. Bennett had Mdle. Marie Cointet; Mr. Wm. Paul Magna Charta, Star of Waltham, and other seedlings; and Messrs. James Veitch & Sons blooms of great merit. Mr. Turner and Mr. Douglas had boxes of Pinks, and Mr. Wheeler collections of tender and hardy cut flowers.

The whole of the large marquee was furnished by the Pine Apple Place Nursery Company, and the plants, both for numbers, variety, and condition, gave an admirable idea of the resources of that well-known establishment. Striking amongst the plants was Lobelia pumila magnifica, which cannot fail to take a foremost rank in our gardens; it is exceedingly rich and free. Lobelia Sparkle is also very attractive, and Blue Stone gives promise of usefulness. The awards were not completed on our departure from the gardens.

### THE CHISWICK GARDEN OF THE ROYAL HORTICULTURAL SOCIETY.

ALWAYS interesting, and much more than interesting, are these renowned gardens. They are in the highest degree instructive, being the national testing ground of flowers, fruits, and vegetables. They are emphatically useful by the quiet progress of important work which is ever going on under Mr. Barron's able superintendence.

With this practical testing ground whereon to found their judgments the Committees of the Royal Horticultural Society possess a means of arriving at a sound decision unequalled by any other body of sensors. In the best interests of national horticulture these gardens should be sustained. As a supply ground for the ornamental appendage of South Kensington they fulfil an important mission, but of immeasurably greater moment is the quiet work done there of accurately proving the qualities of flowers, fruits, and vegetables, and determining an authoritative nomenclature. That is and should be the great object kept in view at Chiswick.

The soil is good, the site good, and the management unquestioned; added to these main conditions is the large body of practical and scientific men forming the Garden Committee, whose object is to elicit truth, and who constitute a jury which should command the respect of the horticultural world.

The gayest part of the gardens are the beds of Violas. These beautiful hardy spring and early summer flowers have been sent by different growers from various parts of the

country. Some of them evidently possess great merit, and are likely to continue blooming, at any rate in partially shaded places, throughout the summer. In Scotland *Violas* are extensively used as bedding plants, but in the drier districts of England their use has not been satisfactory. The beds at Chiswick are in a thoroughly open and exposed position, and the effect of some of them is at the present moment very rich. To those who desire an effective display of flowers in the early months of the year these bedding *Pansies* are commended. They are not nearly cultivated to the extent that their merits deserve, and in most places room may be found for these bright early flowers. Long lines of them in cool shady borders are particularly effective, and beds in partial shade are rich and long-lasting. But for spring and early summer decoration they require no shade, but flourish best in the full sun.

The richest section is the blue and purple-coloured flowers. In this class so many varieties possess merit that it is difficult to select the very best. Taking all points into consideration—as colour, habit, freedom of bloom, constancy, and easy growth—The *Tory* claims a high place, if not the post of honour in this section. It is worthy of extended culture. Richer and finer flowers are seen in *Alpha*, *Royal Blue*, *Dickson's King*, and *Mazarine Gem*. These are indeed fine varieties, but it is doubtful whether they will continue in hot weather. Whether they will or not, they are unquestionably fine flowers for their season. *Blue Bell* and *Lothair* are dwarfer with flowers of less merit individually, but for massing purposes they are varieties not to be lost sight of. *Blue King* is, for spring, one of the best, but for summer effect is not to be depended on in dry districts. *Viola Cornuta Perfection* is free and continuous-blooming, and for lines and masses is useful; *V. O. Magnificent* being richer in colour, but less free and floriferous. The above are the best of this rich section, and all named are worthy of being cultivated.

The yellows are, of course, very bright. The best is *Sovereign*. It is dwarf, rich, free, and, what is no small advantage in *Pansies*, its blooms look one boldly in the face. Some otherwise good flowers have a habit of looking at the earth. A variety may look well in the exhibition stand, but in the garden may hide its beauty. It is essential to correct judgment to see the plants growing. *Bedford Yellow* is a fine, bold, and free-flowering variety, and for large beds and distant effect is one of the best. *Crown Jewel* is also a fine clear yellow. *Yellow Boy* is a small, dense, and exceedingly free-flowering variety. As a dwarf bedder it is good. *Pride of Bufford* is not good here.

A thoroughly satisfying white bedding *Pansy* has yet to be raised, or at any rate proved. Some of them look very nice and pure when the flowers first open, but eventually they become suffused with lilac, which quite spoils them. *White Swan* and *Dickson's Queen* and *Snowflake* are fairly good, but some unnamed seedlings from the last-named Edinburgh firm are the most promising.

Amongst the plum-coloured or maroon varieties *Mulberry* is one of the best. The *Shah* is also very rich. *Queen of Lilacs* is an effective bedding variety; it is novel, free, and good. *Princess Teck* is paler in colour, and less robust in habit. *Primrose*, as its name denotes, is a soft yellow; it is dwarf, and makes a nice bed, but does not hold up its flowers sufficiently to become popular. A variety of the old *Viola cornuta* named "*Williams*" must be noticed. It is in all good qualities a great improvement on the type, and as a bedder is very effective. The old variety *Maggie* is represented; it is quaint, distinct, and worthy of culture. For cut blooms this variety is very useful. The above are the best of the varieties now growing at Chiswick, and they are recommended as being amongst the best of dwarf, hardy, early-blooming garden plants.

We noticed a fine old border plant in excellent condition—viz., the *Willow Herb*, *Epilobium angustifolium*. For large masses of purple in front of shrubs this old plant is especially suitable and effective. It only requires to be planted and it will take care of itself.

Forcing *Pink Lord Lyons*, the parent of *Derby Day*, is very valuable for indoor or outdoor decoration. It is a smooth fine flower of a purplish mauve colour. The *Pelargonium* beds are not yet attractive. The plant department savours of a nursery, for large numbers of popular decorative plants are propagated and grown on for South Kensington.

Fruit trees are in fine order and are heavily laden with fruit. The horizontal cordon Apple trees form an ornamental margin, and the vertical and diagonal cordons on walls are particularly

fruitful and healthy. The collection of pyramid Pears is very extensive and fine, many of the trees being models of this form of culture. The stocks, the French *Paradise*, *Doucin*, *Scott's*, *Rivers'*, and Dutch *Paradise* are all fruiting, the first named being the most prolific and promising. The influence of the several stocks on the *Blenheim Pippin* will, however, be shortly determined, the grafts on the several stocks being very healthy. *Cox's Orange Pippin* two years grafted on the French *Paradise* is fruiting well, and the miniature trees are also growing freely.

The Peach house—trees in pots and standards planted out—is literally full of fruit, and a house of seedling Peaches will shortly be interesting, for most of the trees are carrying good crops.

The large viney is carrying a full crop of medium-sized bunches now being thinned. It is a mixed collection, and in a few months will be an imposing sight. *Gros Guillaume*, of which something has been said in these pages, is showing large bunches and plenty of them on the young wood, but on the old spurs it is nearly barren. Mr. Barron can only produce a good crop of this Grape by laying-in young wood. In the grounds a collection of Red Currants are being proved both as to their correct nomenclature and qualities. Some are robust, some curious, some fruitful, and the rest barren. The most promising are *Houghton Castle Seedling* and *Red Dutch*, syn. *La Hâtive*. This is a very interesting group, and will afford much instruction to cultivators. The most fruitful and profitable Strawberries are *Viscomtesse Héricart de Thury* and *Amateur* (Bradley's). The crops on these varieties are very large and fine.

The chief centre of interest in the vegetable grounds is the Onion department. We did not count the hundreds of labels, each denoting either a sort or the source of a sort. It is a fair and extended trial, and the crop is looking thoroughly well. It is altogether premature to offer remarks on these, but we may note that the *Queen* is distinctly earlier than all others. It is ripening but the bulbs are very small. The great and special value of this variety is noted by Mr. Luckhurst. Sown in the spring it is early but small, but sown in the autumn it is early and large. We reiterate the advice of Mr. Allis, Sow the *Queen* and the silver-skinned pickling Onion in the autumn for an early and valuable crop in the spring.

The trials of Dwarf Kidney Beans are also an important feature of this season's arrangements.

A Broad Bean is worthy of notice, the *Seville Longpod*. It is a very distinct variety, and is affording pods splendid for exhibition purposes. This variety is distinct, of medium growth, and is bearing a nice but not a heavy crop. The whole of the flowers do not set, but the pods when perfected are superior to all others we have seen. It has furthermore another good quality in being four days earlier than the *Early Longpod*. How is it that cultivators and advisers cannot leave off the parrot-like cry of stating the *Mazagan* to be the earliest Broad Bean? That honour does not justly belong to the *Mazagan*, and it is strange that the fact has not been found out by the authorities of kitchen gardening. The *Mazagan* is not an early Bean at all, as all may prove who will sow it and the true early *Longpod* on the same day. The *Longpod* is the earliest and best of the Beans in general cultivation, but the *Seville* at Chiswick precedes it in being ready for use.

Without any great show the gardens at Chiswick are doing important work; they are calculated to confer great benefit on the horticultural community, and the fullest scope should be afforded them to carry out their mission.—W.

## BUTTON-HOLE ROSES.

MR. RADCLIFFE must have written in fun when he recommends *Madame O. Joigneaux* and *Charles Lefebvre* as button-hole Roses; but he might as well have "gone the whole hog" and recommended a full-expanded *Paul Neron*. He omits many beautiful button-hole Roses—e.g., *Madame Faloot*, *Madame F. Janin*, *La Boule de Neige*, and *Prince Camille de Rohan* (in bud). There are several fine Teas, too, of late introduction that he does not mention; for instance, *Anna Ollivier*, very fine in bud for button holes, and *Amazon* the same. I do not think we shall find many rosarians recommend *Abbé Brametel*, *Maxime de la Rocheterie* or *Baron Chaurand* for any purpose.—P.

I AM surprised that Mr. Radclyffe, in giving (p. 486) a list of button-hole Roses, does not mention (*Thea*) *Homère*. It is

without exception the best button-hole Rose I know. Pray recommend it.—A. B.

### CONOPHALLUS BULBIFERUS, Schott.

THIS is one of those Aroids which throw up the flower stalk before the appearance of the leaves. It is clearly what Wight has figured under the generic name of *Pythonium*, and as there is an unfortunate misprint on the plate it was supposed to be distinct from the well-known *Arum bulbiferum*, which is, however, not the case. The plant is interesting from its beauty when the spathe first opens, but unfortunately during the emission of pollen, which takes place under the form of delicate cirrhi, the stench is intolerable, and to some constitutions causes unpleasant symptoms. Out of the same lot of tubers, from which the specimen we have figured was produced, appeared other Aroids, and amongst them the curious *Amorphophallus campanulatus*, which was brought up to South Kensington by Messrs. Veitch on the 16th; the smell, however, like that of putrid cheese, was so intolerable that in spite of its curious appearance it was soon sent home. One plant, after the pollen was ejected and removed to a cooler temperature, became perfectly scentless.

The young stems of various Aroids are sold in the bazaars at Rangoon, tied up in bundles like *Asparagus*. They probably require one or two changes of the water in which they are boiled before they can be eaten with impunity. We are indebted to Major E. S. Berkeley for the opportunity of giving our present figure.

### A HINT TO NURSEYMEN.

In the present day, when in or near large towns, some place where persons can enjoy a recreative stroll without the annoyances of the public road is often a requisition, and a suitable extent of land for a park cannot always be obtained; some nurserymen have utilised their grounds by allowing respectable inhabitants of the neighbourhood to have the privilege of walking in them. This to some extent is advantageous to both parties, since the visitors to the nursery garden are likely enough to purchase some of the trees or plants exhibited from time to time; only a slight awkwardness arises occasionally in

the case of those who may not wish to buy except now and then, and hence hardly like to avail themselves of the boon. I think this difficulty might be met by the issue of tickets of admission at a suitable charge, which might be annual or monthly, according to circumstances, and not transferable.

This would relieve any from feeling they were placed under an obligation they do not precisely know how to meet when visiting a nursery in their neighbourhood for the purpose of promenade; while, having the names of all visitors, the proprietor has a guarantee in the event of any damage being done. In certain instances known to me nurserymen have made it a rule "absolute" that no young children be admitted; perhaps this is going rather too far, and it may be sufficient to require that they be accompanied, not by an older child, but by a parent or other adult.

One nurseryman near Gravesend has launched out in a new direction by not only thus issuing season tickets, but also arranging for "grand morning concerts," three in the season; while the orchestra is to be so constructed as to be subsequently turned into a reading pavilion. There is also to be provided a croquet lawn, with ladies' and refreshment rooms. It remains to be seen how far this will answer expectation, since we cannot suppose that a proprietor of a nursery-ground will run the risk of damage for purely philanthropic considerations. Why should there not be some popular botanical lectures delivered at nurseries in the vicinity of towns, where illustrative specimens could be partly supplied from the garden ground and partly from rural districts that may be adjacent?—J. R. S. C.

### FLOWER MISSION.

AMONGST the appeals for fruit and flowers for the poor, none has been made by the Wilberforce Mission in south London, though any gift of the kind in that poor and densely populated neighbourhood will be most gratefully received. The few flowers they have been enabled to distribute have been highly prized by the recipients. The gift of a few Primroses to their children brought two women

to the church who had never been seen there before, that they might express to the clergyman how much pleasure the sight of the flowers in their rooms gave them. As there is no flower mission, and all their funds are required for the necessities of the poor, would those who feel a wish to brighten the dreary

Fig. 1.—*CONOPHALLUS BULBIFERUS*.

rooms kindly make their flowers into bouquets? Where one garden would not supply flowers for a basket several might contribute a few, and send them, carriage paid, to the Wilberforce Mission House, The Paragon, New Kent Road.

[Those having abundance of flowers could not better bestow some of them than by sending them to "The Wilberforce Mission House."—EDS.]

### ELECTION OF STRAWBERRIES.

THIS apparently being an age of election, could not we readers have one of Strawberries, which would, I think, be a most useful one? now being the time to take votes; four or five sorts for early, the same for midseason, and of course late, making twelve or fifteen in all—sufficient for any useful purpose; also naming staple of soil, as light, medium, and strong, with any other useful hint thought worth notice for some peculiar quality. Rosarians have richly benefited by the elections, why should not fragarians? And as one is said to do well where the other flourishes, I hope to see an election soon, in which I shall be happy to join.

[In vol. xxi., page 897, is an election of Strawberries, but we will readily publish in arranged form further lists of varieties which are found by our readers to succeed in their localities and soils, which must be particularised.—EDS.]

### THE ORIGIN OF OUR GERANIUMS OR PELARGONIUMS.

I HAVE now in bloom *Pel. Zonale* and *Pel. Zonale transparens*, and it is very hard to believe these can be the parents of our beautiful bedding Geraniums. What a vast improvement has been effected! I often feel what a pity it is there should be so little recorded of what our ancestors did in the way of crossing these plants. Who knows the plants poor Donald Beaton employed? Which were the parents of Rollisson's Unique, *Sydonia*, Little Pet, Major Clarke's seedling, or Madame Gewitzaki? To what are we indebted for the various races of large-flowered Pelargoniums, French and Fancy? These have evidently not descended from the same original Cape species, and yet no one I ever met could give me their history. By their history I do not mean the history of the gradual improvement by crossing and selection, but the history of how the first of each race was obtained. The man who effects the first cross between two dissimilar plants, particularly if the result of such cross should prove fertile, has effected much more than he who improves the plant afterwards; he has given the start to a new breed, and no one can tell what beautiful plants may be produced from it.

Botanists have been often accused of making too many species, but anyone who has grown a large collection of Cape Pelargoniums and tried to cross them will hardly think they have erred in this manner with regard to this genus. How they differ in foliage, habit of growth, saying nothing about size and colour of flowers! How little *glanifolium*, *oblongatum*, *tricolor*, *echinatum*, *betulinum*, *radula*, *ardens*, &c., resemble each other! Then, again, it appears impossible to cross many of them with dissimilar kinds—at least it is very difficult. Mr. Wills stated that he had tried thousands of times to effect a cross between the *Zonals* and *Ivy-leaved Pelargoniums* before he succeeded in raising *Willisii*, and many of the crosses produced appear nearly or quite sterile. Who has seen a seed of *Mangles's Variegated* or *Little Pet*? and many others might be mentioned which very rarely produce seed, if ever. Yet when we remember how many beautiful plants grown under the general name of Pelargoniums (bedding or show) have been raised, and how many species there are growing in Africa, who can say what we may yet see obtained from them? How many changes may be rung on a hundred bells? and we have many more distinct Pelargoniums if we can but induce them to cross. If a few have given us such beautiful races of plants, what may we not expect in the future? I have great hopes our Pelargonium Society, if kept up with spirit, will produce great results.

Liberal prizes for collections of native kinds will bring into notice what may be considered raw material, and good prizes for plants the result of first crosses between native species cannot fail to bring to light plants which may prove parents of improved races. The raisers of such plants are apt to undervalue them because they are not perhaps very showy, and neglected plants are soon lost; whereas other persons might have perceived in a plant of this description a fresh

starting-point with great possible results. London described some 240 species, and as many garden varieties produced from them; how many of these can now be found in cultivation? If, as may be supposed, many of them are lost, how much may we not have lost with them of possible improvement?

It will be observed that I have headed this paper "*Geraniums* or *Pelargoniums*," for I do not believe in the distinction, having many plants the produce of two species of Pelargoniums which I cannot induce to seed; whilst I have a plant raised by Mr. E. J. Lowe between a *Zonal Pelargonium* and a *Geranium* which has produced seed. They all belong to the order *Geraniaceae*, and I remember the time when it was thought quite pedantic to talk of Pelargoniums at all. After a time the large show varieties were called here Pelargoniums, and the bedding kinds Geraniums; and really we require some distinguishing names for these two classes. "Show" Pelargoniums will not do when all are shown; "French" and "Fancy" are poor distinctions, equally applicable to many of both classes; "Scarlet" is absurd as applied to a class where scarlet no longer predominates, and which contains every colour from white and pink to dark crimson; "Zonale" is equally absurd, when many of the best have no zones; "Nosegay" is no longer applicable, when it is impossible to say whether a plant has more Nosegay or Zonale blood in its composition; "Bedders" will not do, for many beautiful pot plants do not do well out of doors, but which are grand for the conservatory. So I shall continue to call my pets Geraniums and the others Pelargoniums till we are provided with better names by the recognised authorities.—J. R. PEARSON, *Chilwell*.

### THE CARTER CHALLENGE CUP.

WE again remind intending exhibitors that the competition for this great prize takes place next Wednesday at the Royal Horticultural Society's Gardens, South Kensington, and have been requested to give publication to the following important announcement:—

"As some doubts have been expressed relative to the difficulty gardeners in the more northern parts of the kingdom will have in producing Carter's Champion Runner Bean at this early season, Messrs. Carter, in order to make the competition as great and as general as possible, have kindly consented to make its production optional on the part of the exhibitor, as well as that of the Fern-leaved Parsley."

The schedule is therefore thus revised:—Scarlet Runner Beans, optional; any good variety of Parsley, and eighteen pods of Beans in all cases.

### BELVOIR CASTLE.—No. 1.

#### THE SEAT OF THE DUKE OF BUTLAND.

ANYONE looking at the map of the midland portion of England will see that the three great ducal seats of Chatsworth, Trentham, and Belvoir form a triangle, and nowhere perhaps shall we be able to match such a noble trio. They have each of them their differing characters, but all alike are of that class of which it is said our late dirty visitor the Shah confidentially informed the Prince of Wales that it was not for the security of his throne that such grand places owned by such mighty seigneurs should exist, and signified that he should adopt a short and easy method, quite in accordance with his Eastern notions, of getting them into his own possession. I had seen Chatsworth with its palatial residence and grand surroundings, and Trentham with its soft and luxurious scenery; and it now remains for me to visit Belvoir, unlike in many respects to either of the others—a grand baronial residence, with its turreted battlements, standing high above all around it, towering up in the midst of a level country, a great deal of which is owned by the Duke, whose tastes have doubtless been fostered by the character of the country in which from earliest childhood he has been brought up, and which tastes have to a certain extent stamped their character on the style and manner of gardening which so wise and intelligent a man as my excellent friend Mr. Ingram has adopted to meet the requirements of the place.

The Duke of Rutland is a sportsman, and as Belvoir is situated in the best hunting county in England, it forms his residence during the winter and spring months. When the hunting is over he is off to London for the season, and then to his seat in Derbyshire for shooting, and so on, and therefore gardening at Belvoir is carried on in special reference to the time when he is in residence. Now, go into any ordinary place

in those months, or indeed into many a place where gardening is celebrated, and there is little on which its owner can gaze with much satisfaction. Of course, in his greenhouses and conservatories he has the wealth of other lands, but his garden is bare, the beds are empty, and he only lives on the promise of the future. But it is in spring that Belvoir is in its glory. Its spring gardening is famous, and a mass of beauty greets the eye as one comes upon terrace and glade where flowers which one used to meet with in earlier days, but which have been shoved aside as not fit for their aristocratic congeners, have found a home, and where they amply repay the care bestowed upon them by Mr. Ingram.

It was on one of those beautiful days more like July, in the early part of last month (May), that on my way to Manchester

I determined to fulfil a long-promised wish and to accept an oft-repeated invitation to visit Mr. Ingram at Belvoir. I was indeed a little too late; should have been much more so had it not been for the late spring, or rather shall I not say the prolonged winter? But I was enabled to see a great deal of the beauty of the gardening, and could easily imagine what it had been just before, for it is Mr. Ingram's plan not to depend on a mass of bloom at any one particular time, but to have a continued succession. And so away to the Duchess's garden. This is a beautiful glade of considerable extent, surrounded on all sides by trees of grand dimensions which were then in their early beauty, developing those varied tints of green which, if not quite so glowing as the autumnal ones, are at any rate fresher, and, moreover, are associated with the thoughts of the

Fig 2.—THE DUCHESS'S GARDEN.

lengthening and brightening days of summer, and not with the shortening and darkening days of winter. In this glade the natural rocks have been accommodated to the requirements of alpine gardening, while the upper portion has been arranged in beds. This, while effective, I would fain hope may some day share in what are evidently Mr. Ingram's own predilections, and be merged in the irregular but most effective style which is so charming in the lower parts of the ground. Not that I have a word to say against the bedding-out, save as such, for nothing could be better than the tasteful arrangement of colour both of foliage and flowers. The Tulips, Hyacinths, and Crocuses were all over; but the bedding *Pansies*, the *Oxlips* (of which the Belvoir strain is remarkably fine), were in flower. The beautiful *Gentiana verna*, accommodated with nice little ledges on which its brilliant blue shone out brilliantly, the bright yellow *Doronicum austriacum*, and other fine plants were there. And then how beautiful were the blue *Forget-me-nots*! how luxuriantly fine the *Saxifraga crassifolia*! Then, again, we had the brilliant blue of *Lithospermum prostratum* as it trailed over the rockery, and that of its larger congener *L. Gastoni*. Of a softer but no less beautiful shade of blue was *Myosotis dissitiflora*, though now nearly past, as it is the earliest of the tribe. Then how fine was *Veratrum nigrum*, beautiful for its foliage! And another plant which Mr. Ingram uses very largely—and well may he do so, for its fine bronzy foliage forms quite a grand point in the spring gardening, *Heuchera lucida*—I have not seen it in use before. Then there

were bright masses of *Dianthus neglectus* and *alpinus* with their dense tufts of lovely pink flowers; and turn which way you will gems of rarity or beauty met the eye.

Nor let it be supposed that all this is easily managed work. These midland counties are cold; they suffer from drought, and last summer had been especially fatal to many of the rarer alpine plants. One likes to linger on these slopes, and the clever sketch by Mrs. Ingram, who is an artist of no slight merit, will give some idea of its situation; and as one stands on the upper portion of it and looks down on the carpet of lovely green backed by the feathery and elegant foliage of the Birch, it is indeed hard to be obliged to tear oneself away from it.

A word or two on the beds shown in the sketch. Here is one of *Myosotis dissitiflora*, with *Doronicum caucasicum* springing from it. Here is another—one of the serpentine beds—composed of dwarf Wallflowers, *Myosotis dissitiflora*, *Aubrietia* (Ingram's strain), and at the edge *Sedum* acre. Then I noticed another of *Daisies*, *Aubrietia*, *Oxlips*, *Forget-me-nots*, *Heuchera*, *Heath*, and *Arabis*; but the combinations were numerous and beautiful, although, as I have said, the wilder and more natural portion of the garden pleased me most.

As these slopes are so extensive Mr. Ingram is able to have masses of colour. Those of us who grow a few alpine and herbaceous plants must be contented with their individual beauties, but here it is otherwise; and although no glowing colours meet the eye, yet the deep and lovely blues which so

predominate in alpine plants and are so rare in our gardens, and the bright and shining yellows intermingled with more sombre shades, make a real scene of beauty.

There are some other things about Belvoir I should like to mention, but I have selected as most worthy of notice and most characteristic of the place, and must reserve a few other observations for a future time.—D., Deal.

### THE FERRO-PLANT.

Most plant-stands are formal affairs, mere skeletons of wood or wire, that detract from the beauty of the flowers and do not readily lend themselves to the adorning of a room, or they are very costly and hold but few pots.

Brackets are well enough in their way, but sometimes inconvenient, and so we decided to try the effect of a bit of rustic work, and the result has been eminently satisfactory. A square of oiled cloth prevents damage to the carpet, and on occasion cut flowers and pressed ferns are added to its living beauties. Some sticks of laurel, a saw, bit, and hatchet, with a little mother wit, is all the materials and tools necessary for its construction. Other kinds of wood will answer, but laurel is the best because of its tough and fine grain, and peculiarly suitable manner of growth. Pick out your sticks in the woods, but you must humour them a little, for you will never find just what you want. For putting them together as a frame, use small carriage bolts—nuts inside—one of them is worth several screws or nails, and it must be strong. For the top make a frame of 2 by 3 inches scantling, on which nail

some boards, and then take a sheet of zinc 3 inches larger each way than the top, turn up the sides  $1\frac{1}{2}$  inch, bend the corners round, and you have a water-tight top without rivets or solder. The sides of the frame and top must be hidden by the rustic work. Now put your aquarium in position (the aquarium is an essential part of the ferro-plant, though it may be a globe), then with sand, cinders, and water lime or plaster of Paris, coloured by some dry paints as yellow ochre or burnt sienna, build some rockwork on a separate board fitted in the space not covered by the aquarium.

The flower-pots should stand on wooden blocks or empty fruit-cans turned upside down, which make it much lighter. The branch at one corner is a supplemental affair bolted on; the terminal supports for pots are the collars of gas fixtures, which are admirably adapted for the purpose in size and shape.

To furnish the ferro-plant go to our native woods, and you will find a wealth of ornament hardly dreamed of. Cover and hide the edges of the zinc trough with moss, for which the thin mats torn from the faces of rocks, and sprinkled with

Polypods, are most suitable. Some exotics, as the Calla, &c., are in the figure, but for a long time we had nothing but native plants.—W. H. SHAMANS (in *American Gardeners' Monthly*).

### THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

I WISH to draw the especial attention of your readers, and of my brother gardeners in particular, to the near approach of the thirty-second anniversary festival of the Gardeners' Royal Benevolent Institution. It is to take place at the London Tavern, Bishopsgate Street, on July 2nd, and under the presidency of R. Broadwater, Esq., Master of the worshipful company of Fruiterers, which is most *apropos* of such an occasion, for who can value more truly the services the gardeners do the community than can the fruiterers of the country?

In the long list of Stewards—about seventy in number—we are gratifyingly struck with those who year by year give thus their valuable time and support by their means, to this invaluable Institution. Gardeners have the power to aid this festival, through their employers, by sending fruit and flowers to enliven the display, and thereby to increase the pleasure of those who assemble for a worthy object.

Finally, let me earnestly ask every non-subscribing brother gardener not to pass by this appeal without deciding to become at once a member of this only true federation of gardeners. The simple guinea per annum assuredly can be spared by all who possess the will, even from what I confess

are in far too many cases wretchedly low salaries. Such a guinea will never be really missed by any, and it might to you, as to myself, some day become a solace to old age, infirmity, and adverse visitations of Providence, such as are at present hidden. Apart even from this, delay postpones the guarantee, which is the right of every fifteen-years subscriber or his wife's receiving the Institution's aid.

All packages should be addressed to Mr. E. R. Outler, G.R.B.I., London Tavern, Bishopsgate Street, London, either on Thursday, July 1st, or not later than the earlier trains on the morning of Friday, July 2nd. Let all who will aid, therefore, be so kind as to write to the Secretary as soon as possible.—WILLIAM EARLEY.

ROSES NOT CLUSTERS.—Mr. Robson's demand for "Roses that have the good property of furnishing good long stalks to each flower, whereby they can be cut without loss," reminds me of an old mess-room story, that when a certain officer of high rank, whose head was not very well covered at the top, was chaffing one of his staff for his prematurely grey locks,

FIG. 3.—THE FERRO-PLANT.

the Aide-de-camp replied, "Ah, but I can make my head like your Royal Highness's in a few minutes with a razor; but you can never make yours like mine." Cannot we with a pen-knife make any Rose like those which naturally grow with long stalks to each flower? but we cannot give the abundant bloom to those which flower singly.—AN OLD SUBSCRIBER.

### OUR FRIEND THE CUCKOO.

Do cuckoos live exclusively on caterpillars, or, do they do any harm? I had hoped to have seen this subject more ventilated, as it was referred to in a recent number. Being in Ireland last month and out for a day's fishing (with bad sport), I asked of the keeper what some poles were intended for, and was informed they had hawk traps on the top, and that nearly fifty hawks had been killed this season. This may be all very well, but in addition over thirty cuckoos had been destroyed. Now if, as a correspondent recently stated, cuckoos do good and no harm, and that they are allowed to be scarce this season, I for one should like to plead for the poor cuckoos, and could not do better than through your Journal if you deem it worth notice. I purposely at present suppress the information of the exact locality. I remonstrated with the keeper, who was under the impression they sucked eggs. I told him I did not believe it was so. Unfortunately these traps kill the birds before they are taken.—WAVEBREE.

[Macgillivray, one of our best ornithologists, says:—"It is a very remarkable circumstance that when the bird arrives at first, its food consisting of coleopterous and other insects, the cuticular lining of its stomach is smooth; whereas some time after, when the bird lives chiefly on hairy caterpillars, it is often completely covered with their hairs, which are thrust in and arranged in a circular manner, so as exactly to resemble the pile of some quadrupeds. This disposition of the hairs shows that the action of the stomach causes the mass of food contained in it to move in a rotatory manner. This down, of course, is nothing else than hairs of caterpillars." We are assured that the popular opinion that the cuckoo sucks eggs is a popular error.—EDS.]

### PROGRESS OF THE COLORADO POTATO BEETLE IN 1874.

By W. F. KIMBY, Assistant Naturalist in the Royal Dublin Society's Museum.

FURTHER information regarding the Colorado Potato beetle having been lately published by Mr. Riley in his last report on the insects of Missouri, I hasten to lay his additional remarks before the readers of the *Farmer's Gazette*. The beetle has now penetrated to the Atlantic seaboard at many points, along the whole coast of the United States, from New England to Virginia and Maryland. The newly invaded districts appear to have suffered most severely, because the farmers in those places which have long been infested have become used to the infestation, and familiar with the best means of dealing with it. It is worth remarking, that while the insect has been exceedingly destructive in its original haunts in the mountain ranges up to about 8000 feet, yet it cannot live above that altitude, which Mr. Riley attributes to the very dry atmosphere and the cool nights.

Mr. Riley remarks on the steps which have been taken in Europe to prevent its introduction, and although he thinks that Sir M. H. Beach has rather underrated the danger, yet he considers that the only risk lies in the introduction of the insect in the perfect state. The larva feeds exclusively on fresh Potato tops, and will not touch the tubers; and though the eggs may be introduced with Potato haulm, yet it is unlikely, as it rots too easily to be often used in packing. Besides, Potatoes are mostly exported during that part of the year when there are neither eggs, larva, nor Potato vines in existence in the United States. There is only one other possible way of transmission, and that is in sufficiently large lumps of earth, either as larva, pupa, or beetle. Now, if the American dealers be required to carefully avoid the use of the haulm or straw, and to ship none but clean Potatoes, as free as possible from earth, the insect's transmission among the tubers will be rendered impossible; and when such precautions are so easily taken, there can be no advantage in the absolute prohibition of the traffic in American Potatoes. As well prohibit traffic in a dozen other commodities, in many of which the insect is as likely to be taken over as in Potatoes, and in some of which it is even more likely to be transported. He proceeds

to recommend the plan suggested in his last report, and since adopted by the German government—viz., that cards giving a coloured figure and a description of the beetle should be posted up in all vessels plying between America and the British Isles, with a request that the passengers and crew will destroy any specimens that may be met with.

Mr. Riley considers that the Potato beetle, if once introduced, would thrive as well in most parts of England and Europe generally as in America. Extremes of heat and drought, as well as cold and wet, appear to be unfavourable to it. It is, however, reassuring to be informed that the American farmer by means of intelligence and a little Paris green is pretty much master of the Doryphora, and that the ravages of the insect and its poisonous character, though real enough, have been considerably exaggerated; while no accidents have occurred from the use of Paris green, except from sheer carelessness and exposure to its direct influence, or from applying it too strong, when it is liable to injure the plants.

The last new food plant which the beetle has attacked is the Mullein.

An ingenious contrivance for sprinkling two rows of Potatoes at once has been adopted, being a sort of water-barrel slung upon the back like a knapsack, and provided with two India-rubber tubes, one on each side, ending in a rose like a common watering-pot.—(*Irish Farmer's Gazette*.)

### NOTES AND GLEANINGS.

At a meeting of the Council of the Royal Horticultural Society on the 25th of June Dr. Hogg was unanimously elected its SECRETARY. At the same meeting Dr. DENNY was elected a member of the Council.

—We have seen a PAMPHLET purporting to be a report of the Royal Horticultural Society's meeting of June 4th. That pamphlet is not a faithful report, and although it has the Society's monogram on its title page, that monogram ought not to have been placed there.

—On the 4th of May I found ADIANTUM CAPILLUS-VENERIS growing in moderate abundance on the west coast of the Isle of Man, near the village of Glenmoy. The young fronds were just peeping from the opening in the rocks, some 10 to 15 feet above high-water mark. I have noticed that several writers, in alluding to this Fern, have confined its occurrence to the more southern parts of England and Ireland.—(H. J. MARSDEN, in *Science Gossip*.)

—We have received a REPORT OF THE HOKITITI AGRICULTURAL AND HORTICULTURAL SOCIETY'S SHOW. Many of our readers will be obliged by our adding that that rarely-heard name is of a New Zealand town. It is comparatively a modern township, but rapidly increasing. Two or more newspapers are published there, and among the awards for plants, fruits, flowers, and vegetables are chiefly those known in England; in fact, we notice only one exception—namely, a prize for Cape Gooseberries.

—THE FLOWERS IN BLOOM at Messrs. Suttons' Seed Farm, about one mile from Reading, are presenting a most beautiful sight, and well worth more than a passing glance by passengers to and from Reading by the Great Western, South Western, and South Eastern railways.

### NOTES ON VILLA AND SUBURBAN GARDENING.

WATERING AND MULCHING.—Time is bringing us into the usually hot month of July, when early crops of vegetables will be fast ripening off, and other successional crops in the absence of rain must be supported and kept growing by the application of water and surface-mulching. Water being such a necessary element in vegetable culture, it is important for an amateur not to underrate its value in sustaining the necessary vigour, so that different crops may come to perfection under the burning influence of the summer's sun. For instance, what may be expected from a plantation of Cauliflowers, Kidney Beans, Scarlet Runners, or Peas and Turnips, if a plentiful supply of water is not given them occasionally? The former would soon assume a blue tinge in the leaf as if the plant was struggling for existence, the heads would be small and tough, and in most cases would not be worth eating; the two next would shed their blossom without setting their pods, or would produce very small pods, with, perhaps, but little in them; and the latter would produce a small hard bulb devoid of that tender flesh which makes the Turnip in summer so delicious.

It is easy, therefore, to perceive what a wonderful difference against the cultivator there would be in the produce of these

crops by neglecting to give them the requisite quantity of water. Again, it is not these crops alone, but almost everything in the garden is more or less affected if water is not applied to counteract the effects of dry weather. The amateur's evenings may be very profitably spent by attending to his crops in watering them. Now, in the application of water and the time for doing it, as well as the condition of the crop, are matters worth the greatest study, and must be left in the hands of those to whom it most concerns, aided by a few general remarks which may be suggested as the most applicable to his garden.

While one may have a garden the soil of which is light and shallow, and, perhaps, so situated that little or no shade is provided from the sun, another position may be quite the reverse—that is, on a level in a valley, with a deep, rich, holding soil with a cool subsoil, where but seldom the summer's sun has an effect upon the crops. This is what I should call a good summer garden, but not so early as the former. The crops in the former garden would require double the water to sustain them to that of the latter, so that there is an opportunity of judging between these two extremes, for gardens of the amateur class are situated in all manner of positions or situations.

There is not a doubt that it is wrong to allow any crop to show signs of the want of water, as then the injury in a great measure has been done, and such injured crops do not often recover lost ground. Again, when once watering is begun it ought to be continued at necessary intervals according to the state of the weather and the growing condition of the crops; and if a succession of showers fall, the extent of their benefit and the depth the rain has entered the soil should be ascertained as near as possible. The subsequent state of the weather, if hot or otherwise, should be taken into consideration in order to judge when the next application of water should be given. When water is applied it should be in such quantities as will reach every root of the plant, and not in small dribblets, which a few hours' sun will cause to evaporate out of the soil again.

We now come to what is called mulching, which is doubtless a very necessary work, and especially on light soils. This prevents a too rapid evaporation from the soil, and encourages surface-rooting, and also saves labour in watering by assisting to retain the moisture. If the mulching is a manure the soil is enriched every time the watering takes place by washing the nourishing properties into the soil, and greatly benefitting the crops; but manure is not always to be had, and then other and poorer materials must be used. If it happens that no mulching is used, then as soon as the soil is dry enough it should be hoed or stirred after every watering, because watering has a tendency to bind the soil, so that air cannot enter.

Now, even mulching can be carried too far; for instance, if applied too thick the warmth of the sun does not penetrate it so as to reach the roots, and air is excluded, and the soil becomes sour and sodden to the detriment of the crop it is applied to, therefore judgment and moderation is necessary.

Again, there is another use to which water can be applied—that is, for cleansing the foliage of plants. In street gardens this is particularly necessary, where dust from the roads is continually blowing over the foliage of Roses and all other plants; and how fresh and vigorous and how cheerful it makes these little gardens look after being cleansed by water! The difference is easily seen by looking at a garden that is not so treated. All this work should be done in the evening, or as soon as the powerful rays of the sun are off the ground; in fact, in the height of summer this should be the principal work of the evening for all kitchen garden crops, as well as those of the flower garden. Evaporation does not then go on so rapid, and there is time for the whole plant to become invigorated and strengthened for the next day.—THOMAS RECORD.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### HARDY FRUIT GARDEN.

It has been a good time for Strawberries out of doors, the weather has not been scorching hot, and the few showers have done no injury. In very hot weather our system of supporting the fruit above the leaves with sprays of elm, beech, &c., does not give such good results as when the season is dull or rainy, but it is seldom that the sun is so powerful as to scorch the berries before they are quite ripe, although it has happened once during the last ten years. It was a dry period when the plants were in flower, and the beds had two or three good soakings with clear water, but some mulchings had been previously placed between the rows. We have had two good pickings of Black Prince for preserving. Notwithstanding the large number of recently-introduced varieties, this old sort still holds an important position; it is preferred in the kitchen, and although small and wanting in flavour for dessert purposes, we grow it in pots for the earliest crops. The plants will be layered immediately.

Apple and Pear trees have been summer-pruned, and it has been positively necessary to thin-out the fruit on some of the

free-setting sorts, especially when the trees have been young. Hawthornden, and the variety called New Hawthornden, sets so freely, and the trees have not the characteristic possessed by some other varieties—that is, to throw off the superfluous fruit; and it happens if they are neglected they become crippled for life. This is specially the case if a dwarfing stock has been used. The Apple maggot is now busy, and the men who prune the trees have instructions to pick off and destroy all fruit that has been attacked. The wall trees have been looked over, and all superfluous shoots have been removed, and the remainder laid-in to the wall. All small fruits should be picked as soon as they become ripe, and they must be gathered when quite dry.

### VINERIES.

Some of our readers may think that enough has been said about red spider, still it is the only pest in our vineries, and as this season an experiment has been tried a few closing words may not be out of place. First, the nature of the soil in the garden at Loxford is such that the Vines growing in it are pre-disposed to spider attacks; others who have had to do both with light and heavy soils can testify to the same results. In one of the largest and most celebrated gardens in Scotland, I once noticed that the leaves were nearly destroyed by spider as soon as the fruit became ripe, and was told on making inquiry that it was owing to the light sandy soil. Some growers say syringing the Vines with clear rain water; of course, if you are going to syringe, clear rain water is the best, but the purest water will destroy the bloom, and with it the appearance of the fruit when it is placed on the table; and Grapes that have been syringed with the clearest water would have no chance on an exhibition table in London, or anywhere else, if the Judges know what they are about. There are only two ways left to us—either to sponge the leaves with soapy water (every leaf must be done, and only fancy the labour in a large house, and if it is not thoroughly done it will not be a success); or the next, and our experiment this year has again proved it to be the best, that is to sulphur the pipes, and heating them enough to cause the fumes to destroy the spider (see Doings, No. 742).

Late houses require but little attention now. As the fruit is stoning, and but very little growth is made, the roots must not suffer for want of water; a good soaking of manure water is beneficial, but the application of that must be according to the quality of the border and the quantity of roots it contains. Many Vine borders are made too rich at first, and to make matters worse manure water is applied before it is really needed. We are of opinion that turfy loam with but little more added except some crushed bones is the best border. Stimulants may be applied in the form of surface-dressings.

### ORCHARD HOUSE.

All the Strawberry pots have been removed from the shelves, the fruit had been gathered, except some of the Frogmore type. This is a good late sort, and does good service when Queens and Dr. Hogg are over. It hinders very much the proper management of the Peach and Nectarine trees when Strawberries are grown in the house, as many of the trees cannot be syringed for two or three weeks, which gives insect pests a chance to increase.

### GREENHOUSE AND CONSERVATORY.

Having had much to do with exhibiting for the last few weeks some of the work has fallen a little into arrears, but clearing out a few plants that had finished flowering, picking seed pods from Azaleas, and re-arranging is all that has been required. A few words may not be out of place on exhibiting, as it has all been in our work. A contemporary made some remarks in a recent number on exhibiting stove and greenhouse plants. The paper referred to remarks that something ought to be done to promote a change in the variety of plants exhibited, and make some suggestions. If any change is to be made the societies must do it. Exhibitors will always grow and show the plants best adapted to their purpose, and those that remain longest in beauty are preferred. Take *Pteroma elegans*; it is extremely beautiful when well grown, but how seldom it can be brought in at the right time! whereas *Erica Cavendishiana* will remain in beauty for a couple of months, and then how easily it can be moved without injuring the flowers! If the societies wish certain species and varieties of stove and greenhouse plants to be exhibited by way of a change they ought to name, say twenty-four, and ask the exhibitors to show nine or twelve out of them on a certain date, and give all the same chance.

Some small specimens of hardwooded plants have been reported; this is a matter that should not be delayed, as handsome specimens cannot be produced if the plants become pot-bound in the early stages of their growth. The staple material for a vast proportion of the New Holland plants is good turfy peat. Some of them require a little loam mixed with it, others are better with a little leaf mould, but manures in any form ought not to be mixed with the potting material. Thorough drainage is also very necessary. Young beginners frequently have their plants injured before they perceive that anything is wrong. Many of the Heaths are subject to the attacks of mildew, and it requires an experienced eye to notice it in its first attacks, but it must be

destroyed on its very first appearance. Green fly also finds a lodgment in the young growing shoots of some plants, and being of the same colour as the plant they also escape observation until it is too late.

If any increase in the stock of stage and fancy Pelargoniums is required, cuttings put into small pots at once will strike root readily if they are merely placed on the stage near the glass, and they make good flowering plants for next year. Cuttings of the half-ripened wood of hardwooded plants will strike root freely; they should be taken off at a joint and be potted in light sandy soil, the pots to be placed in others, and some sand filled in between the two pots; this keeps an equable temperature for the cutting pot, and the sand forms a resting place for a bellglass, without which the cuttings would not strike roots. The different varieties of *Kalosanthes coccinea* are very easily grown, the cuttings root very freely, and when the plant is in flower it is very attractive.

#### FLOWER GARDEN.

The rains have been a great aid to us in this department. The lawn is quite fresh, and flower beds are filling up well, and except a few *Calceolarias* which always have a tendency to die off in a continued drought, there are no blanks. Pinks are now in full flower and have done very well this year; pipings will be put in of all the sorts as soon as rain comes. In showery weather the pipings may be put in in a shady place out of doors, and they will soon form roots without the aid of glass lights or frames. Our Carnations and Picotees are grown in pots, and as they come into flower are removed to a position under glass where they can be shaded from the sun. Small indiarubber rings are put round the pods of those that are likely to burst. Phloxes are tied to their supports as they progress in growth. The early-flowering sorts are now coming into flower, and the late-flowering section will be in full beauty in August. Spring-struck cuttings will continue the display into September, so that these beautiful flowers are not so fugacious as many persons are led to suppose. Roses are flowering remarkably well: it is necessary to look over the plants every two days to remove decaying flowers. Orange fungus seems to be prevalent this season; we had it once on some young plants sent home from the nursery, but the affected leaves were cut off and the leaves dusted with sulphur. Whether the sulphur was a specific for it was not determined, but not a trace of it has been since seen.

Auriculas require some little attention now. The plants are at their summer resting period, and the larger outer leaves continue to die off, so that it is necessary to remove them frequently, as if they are not removed in time the plants will suffer. Green fly also increases with the hot weather and must be removed with a small brush; the greatest difficulty with us is to find time to do it at this season. Potting should be finished by this time; if not, let it be done at once. It is now a good time to see to the propagation of scarce sorts. Offsets are now forming at the collar of the plants, but in many instances they are covered with the large outer leaves; if so, it is as well to remove the leaf to give the offset a chance to develop itself.

Hardy Primroses are often devoured by red spider, and also suffer for want of water at this time of the year. They ought not to be neglected, or they will not flower well in the spring. Water well, and wash the leaves with a syringe.—J. DOUGLAS.

### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

BRIMMINGHAM.—July 1st, 2nd, 3rd, and 5th. Mr. Quilter, Aston Park Sec.  
SPALDING.—July 1st and 2nd. Mr. G. F. Bartell, Hon.-Sec.  
TUNBRIDGE WELLS.—July 2nd. Mr. E. F. Loof, Sec.  
MAREDN.—July 3rd. Mr. J. H. Edmontson, Hon.-Sec.  
BROCKHAM BOSS SHOW.—July 3rd. Rev. Alan Charles and Charles Mortimer, Esq., Hon.-Secs.  
SOUTHGATE.—July 3rd. John Miles, Esq., Hon.-Sec., Southgate, N.  
GRANTHAM.—July 5th and 7th. Schedules, &c., from Mr. Lyne, Bookseller.  
HUNTINGDON.—July 7th. J. Oldman, Esq., Hon.-Sec.  
DURHAM AND NORTHUMBERLAND.—To be held at Elswick Park, July 7th and 8th. Mr. R. Bevely, Sec.  
LEICESTER.—July 7th and 8th. Mr. W. C. Morris, 8, New Street, Sec.  
WINTERTON.—July 7th and 8th. Mr. McCallum, Sec.  
FROME (BOSS).—July 8th. Mr. A. B. Bally, Hon.-Sec.  
KILSEY.—July 8th. Sec., Mr. C. E. Braebridge.  
RICHMOND.—July 8th. Mr. A. Chancellor, Hon.-Sec.  
NOTTINGHAM.—Boss Show, &c., July 8th, 9th and 10th. Apply to Alfred Kirk, Municipal Offices, Nottingham.  
OXFORD (BOSS).—July 9th. Mr. C. B. Ridley, Hon.-Sec.  
GRANGE-OVER-SANDS.—July 9th. Mr. B. Thomas Ashley, Sec.  
HEWORTH.—July 14th. Mr. R. H. Felton, Heworth, York, Hon.-Sec.  
OUDLE.—July 14th. Mr. Alfred King, Sec.  
TUNBRIDGE.—July 14th. Mr. W. Blair, Free Press Office, Hon.-Sec.  
WIMBLEDON.—July 14th and 15th. Mr. P. Appleby, 5, Linden Cottages, Sunnyside, Wimbledon, Hon.-Sec.  
DARLINGTON.—July 16th, at Southend. William Hodgson, Sec.  
BRANLEY.—July 19th and 20th. Mr. R. Fox, Sec.  
BRECON.—July 22nd. Mr. W. J. Roberts, Sec.  
HELYNSBURGH, N.B. (Boss Show).—July 23rd and 24th. Mr. W. Ure, Waddell, Sec.  
CROCKHATON.—July 24th. Mr. S. H. Williamson Hon.-Sec.

BRIDGE.—July 27th. Mr. E. Hardeman, Hon.-Sec. [Hon.-Sec.  
PRESTON.—July 28th and 29th. Mr. W. Troughton, 4, Church Street,  
SHREWSBURY.—July 29th and 30th. Mr. H. W. Adnitt, Hon.-Sec.  
SOUTHAMPTON.—July 31st and August 2nd. Mr. C. S. Fulidge, 33, York Street, Lower Avenue, Sec.

### TO CORRESPONDENTS.

\* \* \* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

WOODEN LABELS AND PLANT SUPPORTS (*Newport*).—You can obtain both plain deal labels and sticks from Messrs. Blackith & Co., Lower Thames Street, who advertise in our columns. You can paint them any colour you prefer; they are very cheap. Write to them for the information you need.

SULPHATE OF AMMONIA FOR PLANTS (*C. B.*).—It may be used to potted plants and Vines in your greenhouse, but the liquid must be very weak—not more than a quarter of an ounce of the sulphate to a gallon of water.

CULTIVATING SIXTEEN ACRES (*J. H. M.*).—No answer was given. We send a book which gives directions for two acres, equally applicable to the larger surface.

NEW POTATO DISEASE (*B. S., Harrow*).—The specimens you have sent of Early Rose Potatoes are destroyed by the new disease. Your experience that the English varieties are not attacked, though grown with the American, coincides with the experience of other growers.

FUNGUS ON LEAF MOULD (*J. C.*).—It is the common Mushrooms.

MILLERIA BIFLORA (*A. R.*).—Was named in honour of Philip Miller, author of the "Gardener's Dictionary." The name ought not to be degraded to "Milla." The species is called biflora, but there is a variety described in the dictionary as *Milleria triflora*, which is that you have.

MOths (*W. H. H.*).—What kind of moths trouble you? There are hundreds of species.

RATING ORCHARD HOUSE (*A Constant Reader*).—Personage houses are not exempt from being rated, therefore whatever the incumbent does to increase its value must render it liable to an increase of rating. We say nothing in defence of him or them who look advantage of so small an addition as an orchard house.

INCORUSTATION ON FLOWER POTS (*Inquirer*).—The incrustation is due to the pots being badly burned, and the clay of which they are made containing a considerable amount of lime, the clay not having been well tempered. Oil, by preventing water passing through the pots so quickly, will lessen the incrustation. The best thing you can do is to form Portland cement into a thick wash and apply it to the outside surface of the pots with a brush, and give three coats, allowing the first to harden, as it will in a few hours, before putting on the second, &c. You may sprinkle with sandstone the colour you wish, broken up fine and sifted through a hair sieve immediately after the second coat. It will not interfere with the growth of the Ferns, the drainage being good.

PLANTING STRAWBERRIES FROM POTS.—RUNNERS FOR FORMING (*A Subscriber, Cork*).—Plant those from pots in rows 2 feet apart, and if they are Keens' Seedling, or any early sort of moderate growth, 18 inches apart in the rows; but if President, or a similar kind, they should be planted 3 feet apart in the rows. The ground having been well manured in winter will not require any at planting, but the soil you name would be beneficial—a peck to 80 square yards. Make the soil very firm around the plants, and give a good watering after planting. Runners may be taken off plants which have been forced, but they will need to be layered in small pots and had well rooted before being detached from the parent plants. It is better, however, to layer in smaller pots runners from plants in the open ground, they being stronger and more free from red spider.

FUCHSIA LEAVES PUNCTURED (*A Cork Reader*).—The leaves are eaten by some weevil or caterpillar, which you may probably ascertain by examining the plants, and especially at night, with a lantern; or you may syringe them with a solution of soft soap, 2 ozs. to a gallon of water, which will destroy any thrips and red spider, of which there are traces, and make the leaves distasteful to the pests. The plants are weak, and would be the better of more moisture, sprinkling overhead every evening, and affording slight shade.

FUCHSIA (*W. R. C.*).—They being stopped a fortnight ago will not require to be stopped again for blooming at the time you require; they, with ordinary greenhouse temperature, will be quite early enough. Give them weak liquid manure, and sprinkle overhead every evening, and afford slight shade from bright sun. It is essential that the foliage be kept fresh, therefore keep a sharp look-out for thrips and red spider.

PREVENTING ONION MAGGOT (*Idem*).—Dress the ground prior to sowing with gas lime, spreading it evenly, and at the rate of a peck to 80 square yards, allowing it to lie on the surface for a few days, and then point in with a fork. If for this year you wish a remedy, dress at once with guano, two parts to one of salt, and at the rate of a peck to 80 square yards, applying it in moist weather only; or it may be applied in a liquid state, 1 lb. to twenty gallons of water, and this at the rate of four gallons per square yard, which is nearly equal to an inch of rainfall.

EMBOTHRIUM COCCINEUM (*A Cork Reader*).—The leaf sent appears to be that of this plant. We can only account for its not flowering from its not having a sufficiently warm situation so as to ripen the wood, the shady position inducing to vigour, and that may cause the divergence in the appearance of the plants to which you allude. It requires a warm exposure, and only moderately rich soil.

REPORTING AZALEAS (*W.*).—Pot them at once, the flowering being past, and place them in a house with a brick and moist heat, shading from bright

sun, syringing twice a day, and keeping up a good moisture by frequent sprinkling of the paths and every available surface with water, and in this way secure a good growth, and when this is complete and the buds set remove to a cool and airy house, keeping as cool as possible. We do not advise their being placed out of doors; it is not desirable, or only for kinds which have made their growth and have the buds set early from being forced, and those may be placed outdoors and in a partially shaded position any time after the middle of June, returning them to the houses again at the close of September.

**CYCLOMENS AFTER FLOWERING (E. C. O.).**—Plunge the pots in ashes in a slightly shaded position, and to the rim of the pots, and unless very dry they need not be watered, as the moisture absorbed by the pots from the ashes will be sufficient for them; all they need is to keep the soil moderately moist. At the end of August they should be potted and placed in a cold frame kept rather close, moist, and shaded from bright sun, removing to a greenhouse at the close of September.

**TAKING UP HYACINTHS (Idem).**—Take them up when the leaves turn yellow, and lay them on shelves in a dry airy shed, and when they are thoroughly dried, clean and store away in shallow boxes in dry sand. Tulips, &c., may be treated in the same way.

**DESTROYING WOODLICE (Agriola).**—We do not know in what way you can further proceed against these troublesome pests, having tried hay and scalding them. We presume you have tried the old and good plan of a boiled potato wrapped in a little hay and placed in a flower-pot laid on its side in their haunts, examining it in the morning, and shaking the woodlice, which will be secreted in the hay around the potato, into a bucket of boiling water. A number of these baits will thin the woodlice considerably, and so would a few toads placed upon the bed. A wholesale means of destroying these pests other than by boiling water, which cannot always be used without injury to the roots of the plants, is much needed.

**"DUCKOO SPIT" (Idem).**—It is very common this season, a consequence, probably, of the long-continued drought. A solution of soft soap, 2 ozs. to a gallon of water, will destroy the insect; but as it is mainly fixed to the under side of the leaves, it is necessary that the solution reach those parts, and be forcibly applied so as to wet the insects with the solution.

**GROWING CUCUMBERS IN VINERY (Ignovimus).**—The return you have from the Vines is certainly very little, and would be insignificant as compared with Cucumbers. They will grow the length you name, and give you fruit from the bottom to the top of the rafters, taking care to train-in side shoots, and to stop one joint beyond each shoot of fruit.

**PROPAGATING CLEMATIS JACKMANI (M.).**—Short ripe side shoots put in now or up to the middle of August under a handlight in a shady border and in sandy soil will strike safely, or layers may be made at the close of September, but they will not be well rooted until the autumn following, by which time they will be good plants.

**HYBRID SOLANUMS (Somerset).**—Keep them in the vinery and near the glass, and not shaded, and, if possible, near where air is given, or remove to a light airy position in the greenhouse. Six-inch pots will be sufficient for the plants the first season, and those they should have when the 4-inch pots are filled with roots. They may be stopped to induce a neat pyramidal habit, but beyond this they will not need much stopping.

**GREENHOUSE PLANTS FOR WINTER (Idem).**—Primulas and Cinerarias which you have are the best, but equally desirable are *Cyclamen persicum* var. *Tree*. Carnations are also very desirable. You should have some *Chrysanthemums*, which are easily propagated and grown. Fancy *Pelargoniums* would not flower well in autumn and winter, but the best of the seasonals will fit out now; the cuttings of these will also bloom in the winter months.

**PROPAGATING CAMELLIAS (Double White).**—The double varieties do not do well upon their own roots, mostly growing too weakly. The best time to put in the cuttings is when the wood of the current year has become nearly ripe, which will be the case by the end of June or beginning of July, when they will have the wood firm, but not thoroughly ripe, and taking them of 4 to 8 inches in length, cutting transversely just under the lowest leaf, removing it and the next, and insert them around the sides of pots well drained, and filled with sandy loam sifted rather fine, and put into the pots firmly, and they may be put in rather thickly, and stand the pots in a cold frame kept close by day and with a little air only at night, and shaded closely from sun. It is necessary that they be kept moist, sprinkling them in the morning of each day lightly. In about two months they will be rooted, but we should not pot them off singly until the middle or close of September, and in 8-inch pots, in sandy loam and peat, and return to the frame, keeping rather close, moist, and shaded until the close of October, then remove to the greenhouse.

**BUDDING ROSES (E. M. Major).**—You may bud them during the present month. We cannot name varieties of Roses or of any other florists' flowers.

**INSECTS ON HONEYSUCKLE LEAVES (W. Smart).**—The objects sent by you as "pupa cases" are the empty eggshells of one of the many species of *Belg bug* (*Pentatoma* sp.), and the small dark-coloured objects are the newly-hatched young bugs.—I. O. W.

**SELECT CARNATIONS AND PICOTEES (Cactus).**—We can only name a few. Carnations: *Scarlet Bizarres*.—Campanini, Dreadnought, Duke of Edinburgh, Mars, Invincible, and Guardaman. *Grimson Bizarres*.—Marshall Ney, The Lampfighter, Graceless Tom, Colonel North, Eccentric Jack, and Gem. *Pink and Purple Bizarres*.—James Taylor, Purity. *Purple Flakes*.—True Blue, Ajax, Dr. Foster, Earl Stamford, John Robinson, Mayor of Nottingham. *Scarlet Flakes*.—Christopher Sly, Superb, Marshal St. Arnaud, John Bayley, Illuminator, and Annihilator. *Rose Flakes*.—Mr. Martin, Illustrations, Mrs. Frederick Burnaby, Phœbus, and Sybil. *Picotees*: *Red-edged*.—Colonel Clerk, J. B. Bryant, Leonora, Lord Valentia, Mrs. Hornby, Mrs. Keynes. *Purple-edged*.—Mrs. Little, Norfolk Beauty, Edith, Venus, Admiration, and Mary. *Rose and Scarlet-edged*.—Edith Dombtrain, Julliana, Mrs. Allerott, Ethel, Duchess of Edinburgh, Mrs. Fordham. *Yellow-ground*.—Goldfinder, Gold Button, Sovereign, Seraph, Empress of India, and Claude.

**OPUNTIA CYLINDRICA CRISTATA (Idem).**—It is not particularly rare, but is not a very common kind; in fact, succulents cannot, except in a few sorts, be considered common, they being grown to only a limited extent in most gardens.

**WHITE FLOWERS FOR FUNERAL WRATHS (E. H. G. P.).**—Stove.—*Clerodendron Balfourii*, O. Thompson, both flower March to June, and more or less up to autumn, they have a portion of red in the flower, but that may, if objectionable, easily be removed; *Eucharis amabilis*, May and autumn, sometimes early in spring; *Gardenia citrifolia*, March; *G. florida*, April, May, and June; *G. radicans* major, June and July; *Hoya bella*, June onwards; *H. carnea*, June and July; *Ixora soumaria*, June and July; *Jasminum gracile*,

May onwards; *J. Sambac* flore-pleno, March onwards; *Stephanotis floribunda*, May and June; *Tabernaemontana coronaria* flore-pleno, winter. Greenhouse.—*Bouvardia candidissima*, Davisonii, Humboldtii corymbiflora, The Bride, Vreelandii, winter and spring; *Carnation La Belle*, The Bride, Avallanche, Queen of Whites, winter and continuously; *Citrus aurantium*, C. japonica, April and May; *Cyclamen persicum* album, winter and spring; *Daphne Indica* alba, spring; *Draophyllum gracile*, May and June; *Epaen The Bride*, winter and spring; *Erica melanthera*, spring; *Eugenia Ugni*, April; *Jasminum grandiflorum*, spring and autumn, *Kennedy ovata* alba, April and May; *Mandevilla suaveolens*, June onwards; *Myrtus communis*, May and June; *Primula cortusoides* alba, April; *P. sinensis* alba plena, *Rhododendron jasminiflorum*, May; *Rhynchospermum jasminoides*, May and June; *Solanum jasminiflorum*, summer and autumn; single and double white *Violets* will in pots bloom most of the winter in a greenhouse, and *Lily of the Valley*, *Deutzia gracilis*, *Spiraea japonica*, S. Thunbergii being valuable in spring; so are white *Asaleas* as alba, Borsig, Comtesse de Ribencourt, Fielder's White, *Narcissiflora*, and *Beine des Blanches*. Invaluable for winter are *Everlastings*, "Immortelles," as *Azodolium album*, *Ammobium alatum*, *Gomphrena* alba, *Helichrysum bracteatum* album, *H. monstrosum* album flore-pleno, *Helipterum corymbiflorum*, *Rhodanthe maculata* alba, and *Xanthanemum annuum* album flore-pleno.

**TODEA SUPERBA (M. D. C.).**—It should be lightly sprinkled overhead morning and evening, and in a very moist and rather close atmosphere does not require a glass shade. It will do well enough over water, but not with the pot stood therein, being impatient of stagnant water at the roots.

**ARMORHA JAPONICA VITIFOLIA—HONORINE JOBERT (Idem).**—The plant usually does not flower until late in summer, and continues a long time in flower. Being very vigorous it will probably bloom finely in August and up to frost. A. japonica and var. are fine in late summer and autumn, and are deserving of extended culture; they have in addition to fine flowers a handsome appearance in mixed borders from their foliage.

**NEOTOPTERIS NIDUS (A Young Exhibitor).**—It is not a tree Fern. It is the *Asplenium nidus* of Linnaeus.

**DISEASE IN AMERICAN POTATOES.**—"W. H. A." informs us that it is attacking them in north Lincolnshire, and did the same last year. He asks what was the parentage of Sutton's Red-skinned Flourball Potato. It is very similarly attacked.

**POPLAR BLEEDING (J. Keenerts).**—Seal the wound thoroughly with a red-hot iron, and then paint over the charred surface with painters' knotting; that is the paint painters use to prevent the resinous exudation from the knots in deals.

**NAMES OF PLANTS (A Constant Reader).**—We cannot name plants from their leaves only. (G. B. C.).—We cannot name the varieties of *Roses* even, they, like all other florists' flowers, are too numerous and alike. (*Lady King*).—A *Geranium*, specimen insufficient. (*Rev. S. A. Brennan*).—Apparently *Rosa gallica*, but this is not an Irish plant. A note as to the circumstances of its occurrence would be of interest.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### SCENES AT THE CRYSTAL PALACE DOG SHOW.

WHEN at the Croydon Show I suddenly remembered that the Dog Show at the Palace was at that very time going on. Indeed, it together with the Ialington Horse Show helped to account for the thin attendance at the Bath and West of England Meeting. I was determined to make for the Dog Show, so reaching Sydenham station, I walked with an old poultry friend from thence to the Palace. And, oh! dost thou love a pretty walk, good reader in early summer? If thou dost and art near London take a ticket to Sydenham and do as I did, and let the time be when the lilacs and laburnums are in bloom. I passed along pretty broad roads, with peeps every now and then into villa gardens—fine large gardens, not mere scraps of earth, and villas well built, and large and mansion-like. The day was what we look for in "leafy June," not yet broiling summer, and May's chilliness gone. Alas! that the poetical May should, usually by the east wind, be rendered such a fib. I passed on, meeting groups of healthy children with their nurses. And what a test of a neighbourhood is the appearance of the children in it! There is no truer test. The poverty of a place is seen staring-out at you in the children's pinched cheeks and thin limbs; while well-fed little ones—with round faces and deep dimpled-chins and clean attire, as surely tell us that we are in a well-to-do part of England. I passed on and entered the Palace grounds towards the lower part of the park, and walked upwards through its grounds and gardens to the Palace. How beautiful are these grounds and gardens! The Palace may disappoint, part being gone, and many portions look shabby and worn. The vaulted courts look dull, and their monumental designs show cracks and flaws. But the gardens are better and better, the view still as grand, the shrubs each year grander. How better is nature than art—the former never can be vulgarised, the latter often is. The grand dreams about the Palace have long since passed away. It is a place of shops, and not very high-class amusements; but its situation is grand, its garden and park beautiful.

I reach the terrace just as the fox terriers are being judged, a class of dogs particularly to my fancy. The owners of the dogs now, I see, as a rule, are in attendance with their pets, and they no longer suffer servants to hold them. The ring of dogs is large, but gradually grows smaller as the least deserving in the eye of the Judges are weeded-out. The dogs are, as a rule, admirably shown, and there are fewer over-large animals. Tight, trim, neat and rather small dogs are favourites—dogs that

can work, and whose size does not prevent their entering into a fox's earth. There were also some with great beauty showed also many scars on their faces, thus clearly proving them to be, not mere pretty-shaped pets, but true plucky workers. The sight on the enclosed spaces on the terraces and slopes above was very pleasing to any lover of dogs. The rings of dogs below with the Judges in their centre; then on the slopes the many interested lookers-on. How nervously anxious were the owners. Exhibiting must be a trial to the nerves, for I notice that conversation with an exhibitor prior to the judging is but on his part broken sentences, the one thought, "Oh! shall I win?"

Later in the day I went into the Show itself, and I must say that it far excelled any exhibition of dogs which I had ever seen. Its freedom from offensive smells proved that the care of the managers was great. Evening was now coming on, the inside was getting dim, the poor animals were inclined to quietness and sleep, and no exciting gas as at Birmingham had been lit. Coming to the middle portion of the Show I see a small crowd moving forward, pushing towards the centre; then there are cries of "Stand back, stand back, room!" Surely, surely, it is not a dog fight at a dog show—not the old cruel sport—these are days of gentle fancies, and wicked sports happily do not go unpunished. The crowd grows larger, there is a wonderful attraction in a moving crowd gazing at some central object or objects. I am drawn into the whirlpool, and have made up my mind to call in the police and stop the fight, and write about it to the "Animal World." I am in the crowd now, like the rest, I am on tiptoes actually, and as the penny-a-liner would say also, "On the tiptoe of expectation." I force my way nearer the centre, I plainly see ladies are near enjoying the scene. "Oh! this is worse than Hurlingham! How had these women of modern days are! Ladies enjoying a dog fight, for I am sure there are dogs and ladies too. Oh! fie for shame!" Still nearer I get. I can see more now. Why, there are hair brushes in the air. What can it all mean. I press nearer—hair brushes the best that money can buy, new and clean. It is surely an exhibition of ladies' hair as grown on the head to prove that all is not false. This is a good idea, and I will see which girl wins—which has the longest, and thickest, and loveliest home-grown production. I get nearer to gaze on the fair heads to see them pass the smoothing brush over the black, or the golden, or the auburn, or the fair flaxen, as the case may be. I see the brushes and the hands—small and delicate, moving rapidly. I am in the centre now, and oh! no dog fight, no lady's-hair prize, but lady owners are giving the last brush to their Maltese dogs before they go into the hands of the Judges, who stand close by. The texture, gloss, and exact parting of the dog's hair down the line of the spine were really wonderful. The best seemed like creatures clad in spun glass or floss silk, and no lady's hair was more evenly parted.

By the way, the Judges of these classes ought to be old, very old, and rather spiteful bachelors, or unfairness might arise. Thus, say a very pretty bright-eyed lady with a coaxing smile held up her dog beside a bony, hard-featured, withered, woman's-rights virgin, would it not be human nature, or rather "man" nature without the "hu," to give the prize if possible to the dog owned by the fair lady, and to receive in return such a smile? So to correct the balance I would say, Let the dogs be held only by the attendants at the show, or let the Judges be the crustiest of old bachelors, and, if possible, let them be suffering from suppressed gout at the time. I have noticed the sufferings of gentlemen exhibitors, but theirs were nought to those of the lady exhibitors. I marked such pale cheeks of anxiety, lips bitten hard (lips meant for a better fate), muscles twitching, and a whole demeanour marking the combat going on between hope and fear. Verily I am glad I am not an exhibitor.

All is over, the Judges' decision is given, the little crowd breaks up only to gather again around the owners of the Blenheim Spaniels. Again the same scene, again the ladies and their dogs—their pretty Blenheims, vastly superior to my taste to the Maltese; but tastes differ, and right they should; and that tastes differ is never more plainly seen than at this dog Show. Perhaps its ample provision for taste of all kinds is one great element of its success, for successful most certainly it was.

—WILTSHIRE RACTON.

### OUR SPRING HATCHING.

I ~~see~~ reiterated this week in the Journal the failure of chickens this season, and was expecting to have seen answers from those well experienced to your invitation regarding the effect of frost or cold upon eggs, but being in this respect disappointed, I venture to give my experience, though a young amateur.

I only commenced keeping fowls this season, and being a novelty my children were so delighted at obtaining the eggs that they were all gathered immediately, or soon after, being laid and brought into the house, and I found nearly every egg that was set—and I set a good many during the cold spring—were with scarcely an exception all prolific, and in the spring was very successful in rearing the chickens. Since then

I have not been so successful. I must, like other amateurs, learn by experience. My hens became uncomfortable and left their eggs just before hatching, and I have only recently discovered the cause—their becoming troubled with insects, which I attribute to having moistened the eggs with water. I do not consider this requisite, and shall discontinue the practice until I have proof of its necessity, for, as someone pointed out in a recent number, hens at large will as often make their nest in a dry loft as by a damp hedge-side. I had taken the precaution of putting cinder ashes under the nests, believing this would deter insects. For the future I shall be able to combat with this difficulty, but should be glad at the same time to receive hints on the subject.—WAVERTREE.

### POULTRY SHOW SCHEDULES.

GREAT GRIMSBY has its Show on July 21st, 22nd, and 23rd, in connection with the Lincolnshire Agricultural Society. The schedule is almost the same as last year; though good in some points, it is still open to immense improvement with the same expenditure in money. Dorkings have one class with four good prizes. Game have two classes and seven prizes, Reds coming off very well indeed. Brahmans and Cochins have only one class each with three prizes. Why will committees be so foolish? No classes fill like the Brahmans. Hamburgs have two classes only with four prizes. Houdans and Crèves have each a class, and there is one for Poland. There are two Selling classes for cocks and pairs of hens with handsome prizes. Turkeys have a class, also Geese, and Ducks three, and we are glad to see a class for Guinea fowls. Entries close July 8rd. The fee is 3s. 6d. a pen. Judges "competent," but nameless, are to award the prizes. When will committees see the folly of their ways? We see nothing about baskets in the rules, so we suppose double and single may be used.

NEWELL (near Burton-upon-Trent) has its Show on July 21st. It is quite a miniature affair. We are sorry for this, because this is the Society we believe which had its Show at Horninglow in 1873, when the schedule was quite imposing. There was a falling-off last year, but this season they have come down to 12s. 6d. and 7s. 6d. prizes. We are very sorry for this, as we have pleasant recollections of the 1873 exhibition. As far as the schedule goes the classes are fairly distributed, and Cochins and Brahmans fare better than they do at Great Grimsby. The entry fee is 2s. 6d. Baskets are again left open as to description. The Judge's name is not announced!

CASTLE DONINGTON holds its floral fête and poultry Exhibition also on July 21st. The schedule is most peculiar. There are classes for all kinds of breeds, with two prizes in each of 10s. and 5s.; and a special prize, the value of not less than £1, is given to every two classes. We wonder whether these "specials" will much exceed the £1, and whether they will be paid in hard cash or in little useless articles. We almost think we must try and win one of these "not-less-than-£1" prizes, and see what we shall draw from the lucky bag. Cochins have six classes and three of these specials; while Brahmans four, and Dorkings two; Houdans, Spanish, and Bantams each have two classes; Game and Hamburgs four each. There is a class for chickens of this year of any breed with four prizes. Ducks, Geese, and Turkeys all have classes. We rejoice to come at last to a schedule where the "gentlemen of acknowledged ability" have names. Here they are to be Rev. T. O'Grady and Mr. Hutton. Non-subscribers pay 2s. per pen, but a subscriber of 5s. only 1s. per pen, which is most reasonable. Entries close on July 14th. Nothing is stated about baskets.

THE ORMSKIRK and SOUTHEAST Society meet this year at the latter town. This is one of the first chicken shows of the year, and we shall watch the results with interest. The prizes are £2 and £1 in each class, and there are classes for old birds and for chickens of the year. We are very glad to see White Dorkings have their two classes. There is no class for Black Hamburgs, which surprises us, and White Cochins are pushed off to the Variety class, and we hope the insult will be returned by not one pen of the breed appearing at the Show. Entry fee is 2s. to subscribers, and 5s. to non-subscribers. Entries close July 13th. Post entries, with extra fees, will be taken up to July 19th. The names of the Judges are not given, and we see no mention made of baskets. There are two £5 cups, one for Game and one for any breed not Game. The Pigeon department is good. There are three prizes in each class, and five point prizes besides. It is the single-bird system, and the entry fee is 8s. per pen. Carriers have four classes, and one for birds bred in the year, as, too, there are classes for 1875 Dragons, Barbs, and Antwerps. There are classes for English and foreign Owls, but Tumblers and Turbits have only one each.

THE ROYAL MANCHESTER Society meet at Preston this year. The schedule is a fac-simile of the one at Stalybridge last season. The prizes are very handsome—£3, £2, and £1 in each class. The Show is for 1875 birds only, and the classes are well and fairly distributed; but we much regret to see the Silver-Gray Dorking class of 1873 again is omitted, and that no

inducement has been held out to White Cochins. Buffs and Partridges are well looked after, but Whites are sent to the refuge. This must be wrong. Geese have two classes. The entry fee is 3s. for subscribers, and 6s. for non-subscribers. The Judges' names are not announced, but we generally find the right sort here. Again the basket subject is not mentioned. We hope this is a general dawning of better days, and that committees, while cutting out the old rule of separate hampers being necessary, leave it to the exhibitors' taste to use double or single packages.

NEWBURY (Berks) has a "grand Exhibition of poultry and Pigeons" on August 24th. The schedule is good, but not grand. We hope, however, the anticipated display will be grand, and so make this young Show worthy of its title. There are three prizes in most of the classes, and four £5 silver cups. Dorkings, Brahmas, Cochins, and Hamburgs have two classes each, but Game only have one. Polands have a class. There is a class for 1875 chickens with good prizes. Ducks have three classes. The Pigeons are well classified, but the prizes are so poor that this department can only be local. There are also local poultry prizes, which are arranged in a new way, and in a manner we would especially recommend to those committees who go in for local classes. The entry fees are 3s. 6d. and 2s. 6d., and the entries close on August 9th. The names of the Judges are not announced, but they are to be of "acknowledged experience;" and the old basket system is in use here, we are sorry to say.

BRECKNOCK holds its annual Show of poultry, Pigeons, &c., on August 25th. It is a fair schedule, and most of the chief breeds have three prizes in each class. Game have three classes, and there is one, too, for Polands. There are for 1875 chickens two classes—one for the large breeds, and one for the smaller. We are glad to see a cottagers' class, and hope it will be well supported. The Judge is announced—viz., Mr. Hutton, but each pen must be in a separate basket. Entries close on August 10th, the fee being 3s. 6d. There is a severe rule against trimming, which we give in full, as others may like to copy it in their schedules:—"11.—The Judges will be specially instructed to disqualify and mark any pens of birds they may discover trimmed or altered in character for the purpose of exhibition (except the dubbing of Game cocks). In case of any such disqualification duly certified under the hand of the Judges to the Committee, all the pens of the same exhibitor throughout the Show will be also disqualified on account of such fraud; and both the penalty and the reasons for it will be stated in the prize list, and notice thereof legibly affixed to the front of the said pens. These notices will be maintained throughout the Show, and anyone found removing or defacing them will be given into the custody of the police." The Pigeons have only 15s. and 7s. prizes. There are eleven classes, one of which is for Nuns. The entry fee is 2s. 6d. per pen.—W.

### THORNE POULTRY SHOW.

Is it usually the custom to allow birds to be removed from the show pens during the Show? At the recent Thorne Show I observed in Classes 77 and 78 (the awards were not then given to those particular classes) several vacant pens. In Class 77, which had eight entries, only three birds appeared; heavy showers were falling, and these three birds were more or less wet and dispirited, so that it was not surprising when the prize-list appeared that the honours were in more than one case taken by birds which had not borne the brunt of the storm. Among the birds thus exposed to the weather, and subsequently passed over unnoticed, were some which had taken high honours at the Palace and other shows, and might no doubt on this occasion have presented a different appearance had they shared the advantages of their rivals. In addition to the unfairness, it is a great disappointment to fanciers who go to see the birds, and find some of the best pens removed. I am told that after the judging some fine birds were removed from other classes, and visitors had only the pleasure of seeing the prize card and the empty pen.

The rule in the schedule is that birds were to be penned at 10 A.M., but after eleven o'clock I saw poultry hampers admitted at the gates of the show ground, giving great advantages over exhibitors who had been obliged to send their hampers the night before.—E.

[We have for many years past uniformly protested against poultry shows being held in open grounds, as a certainty of fine weather cannot in our variable climate be ever depended upon. At Thorne the poultry and Pigeons were arranged under the shade of high trees, and when the heavy thunder storms prevailed most of the visitors betook themselves to the shelter of refreshment tents, &c. Some few of the exhibitors who travelled with their birds were prepared against such an exigency with oil-sheets, and consequently their pens were protected from the positive downpour, as were a few pens that happened to be under those trees that had the most abundant foliage; but we cannot say whether or not any of the birds were temporarily or finally taken away during the Show time by their respective owners.

It is only a short time since we heard of a man in charge of poultry stripping himself of both his coats and his waistcoat to protect his birds, and the result was, to use his own words, "I got the cup by it, and the worst illness I ever had in my life!" We again say, Shows without covering are altogether a mistake.]

### DARI.

SOME of your friends are asking about dari. I beg to say my attention was first called to this corn seed three years ago. I was at the time keeping Gold Pheasants, Black Bantams, Houdans, and Black Cochins. Finding all the birds did so well on it, particularly the Pheasants and Bantams, I was the means last season of inducing two or three of our large breeders of Pheasants and Partridges to give it a trial, although they had an exceptionally good season. They were not at the time at all willing to give any credit to the feeding on dari. Evidently a change has taken place in their views, for within the last fourteen days I have been solicited to obtain for them, if possible, a few quarters of the stuff I was so kind as to send them last year.

I cannot speak so positively as Mr. G. Riley does of its egg-producing properties, but for keeping birds in good health and feather I never used its equal. Pigeons and Doves are delighted with it, but should only have it on high days and holidays, they eat it too ravenously. My experience is that it should only be given very sparingly, and not oftener than twice a week.—JAMES ELGAR.

### THIRSK SHOW OF POULTRY, &c.

THE sixth annual Show was held at Thirsk on the 23rd of June, and the day proving, unlike that of last year, very fine, it was a success in all respects, and for the amount offered in prizes the entry for poultry was something extraordinary, and it is our opinion that if a real good prize-list were offered by this Society, such is its popularity that a most excellent show would be the result. On this occasion there were about 240 entries for 10s. and 5s. for poultry, and 5s. only for Pigeons.

Dorkings were a very good lot, and all Dark Greys; Game poor, and Spanish a fair lot. Pen 887 were a grand pen of Buffs, and well placed, the other noticed birds standing well. Brahmas all Dark, and a pretty good lot. Only the winners in Gold-spangle Hamburgs were deserving of notice, and in Silver-spangles the three noticed were only of quality, but these were good. In Gold-pencils the first was a grand pen, the second a better cock, but rather wild, and the hen not equal to him. Silver-pencils only moderate, while Black Hamburgs and Polands were good. Black Bantams were the best class in the Show, many pens being really excellent. In Game Bantams Mr. Steel's pens were empty; there were some good pens, but the majority were not good. In the next class the first were capital Silver Sebrights, second being Gold. In Ducks, Rouens were a fair class, an extra second being given; Aylesbury good, while in the Variety class Black East Indian of only poor quality won. Turkeys and Geese were each fair lots, and Guinea Fowls really good. In the Selling class a fair pair of Black Red Game were first, and Gold-pencils second; and in the Variety class the first were Sultans, and second Malays. A class for chickens of any variety was provided, the winners being Gold-pencils and Dorkings.

In Pigeons there were forty entries, only one prize in each class being offered; the Jacobins, Fantails, Owls, and Dragons proving good, the latter especially, a pair of Reds, being a really grand pair.

DORKINGS.—1 and 2, J. White, Warlaby, Northallerton. 3c, A. Jackson, Broughton, Northallerton; T. Newbald, Clifton, York.  
GAME.—1, G. Carter, Bedale. 2, Holmes & Young, Driffield. 3c, Lister and Pounder, Seaham, Yarm; J. Cass, Hovingham, York; G. & T. Kidson.  
SPANISH.—Black.—1, C. W. Jefferson, Northallerton. 2 and 3c, G. Pounder, Kirby Moorside. 4, Rev. H. Hawkins, Topcliffe, Thirsk; T. Flintoff, Newby, Stockton-on-Tees.

COCHIN-CHINA.—Buff.—1, Urwin & Ibbeson, Whitby. 2, J. North, Fartown, Huddersfield. 3c, Lady Bolton; J. North. Partridge.—1 and 2, J. Bell, Thirsk.  
BRAHMA POOTRA.—1, T. P. Carver, Langthorpe, Boroughbridge. 2, E. Williams & Son, who, G. B. Bell, Layton, Caulwell, Darlington. 3c, Lady Bolton; Miss Jacques, Richmond.

HAMBURG.—Golden-pencilled.—1, R. Keenleyside, Aycliffe, Darlington. 2, Holmes & Young, Driffield. 3c, T. P. Carver; G. Garbutt, Sinnington, Pickering. Silver-spangled.—1, Holmes & Young. 2, G. Garbutt. 3c, Wells & Sherwin, Ripon.

HAMBURG.—Golden-pencilled.—1, T. P. Carver. 2, J. Newbald, Clifton, York. 3c, A. G. Mitchell, Bishop Auckland. Silver-pencilled.—1, W. Bearpark, Northallerton. 2, J. Cass.

HAMBURG.—Black.—1, T. P. Carver. 2, G. Slater, Fairlawn, Ripon. Polands.—1 and 2, G. Walker, Boroughbridge. 3, W. Bearpark.  
BANTAMS.—Black.—1, E. H. Ashton, Mottram, Manchester. 2, T. P. Carver. 3c, J. H. Cartwright, Willington, Durham; Rev. H. Hawkins, Topcliffe, Thirsk. 4, Wells & Sherwin, Ripon; J. North, Fartown, Huddersfield; A. G. Mitchell, Bishop Auckland.

BANTAMS.—Game.—1, W. C. Dawson, Whitby. 2, Wells & Sherwin. 3c, W. Gray, Tow Law, Darlington; Holmes & Young, Driffield. White, or any other variety.—1 and 2, T. P. Carver. 3, T. Harter, Thirsk. 4, W. Richardson, York.

DUCKS.—Rouen.—1 and 2, G. Garbutt, Sinnington, Pickering. 3, T. P. Carver. Extra 3, W. J. Wetherill, Whitby. Aylesbury.—1, J. Arrowsmith, Kilmington, Thirsk. 2, T. P. Carver. Any other variety.—1, G. Sadler. 2, J. Arrowsmith.  
TURKEYS.—1, Miss Kirk, Givendale, Ripon. 2, C. McC. G. Swarbrick, Sowerby Thirsk.

at present will not enter upon it beyond saying that, with a view to have more light, I am also prepared to give Dr. Morgan, or anyone else, £50 in money or plate who works out the problem, either forwards or backwards, in accordance with the terms stated in Mr. Huie's letter.—Gmo. Urm.

### HOW I OBTAINED MY BEES.

It is fourteen years since I lived with a gentleman who kept bees, since that time I have seen but little of them. On the 5th inst., at 11.30 A.M., I was going from one part of the garden to the other (which is about thirty acres), when one of the men called to me, saying "Here's a swarm of bees." He was knocking a beet-tin with his hoe. He called it "ringing them down," a very common thing in Lincolnshire. So I ran to a house 500 yards off where they kept bees to see if theirs had swarmed. They had only one stock hive, and it had swarmed a few days before, and the swarm had gone into an empty hive, where the bees had died during the winter, standing by the side of the parent hive. So I borrowed a hive of them, a common straw skep 13 inches across by 12 inches deep. I ran home for a glass of beer and some sugar and some fennel, and rubbed the hive with the mixture. When I returned the bees had alighted on a straight piece of the thorn hedge, so I pulled it down and gave it a good shake and turned it down under the hive. I did not even get stung.

Off I went to my employer to tell him and ask him for the bees, as I am only garden bailiff here, and did not like to take them away of my own permission. He gave me consent, so at night I wrapped-up the hive in a sheet and carried them home. On the 8th I weighed them, and the hive altogether was 10½ lbs. My friend weighed two of his empty hives, and they were 5 lbs. 6 ozs. I have given them 1 lb. of sugar with cold water, a little every day up to the 17th, and at night I turned them up to look at them. They appear to have filled the east side of the hive from the middle nearly to the bottom with beautiful white comb. They go laden in, some with yellow and some with a very dark pollen on their legs. There was a drone went in yesterday (June 17), the only one I have seen. I suppose it is a first swarm by its being so early as the 5th of June. To-day I boiled a pint of water and 1 lb. of white sugar together, and poured it into two jars, and put a bit of round wood with a lot of holes in it to float on the top, and by dinner-time they had cleared it all up.—J. M., Lincolnshire.

### SWARMING.

In reading over Mr. Pettigrew's article on swarming I am fairly put to bay, inasmuch as that I am doing all I can to prevent my bees from swarming to insure first-rate stocks for next season, and, as I hope, good early swarms. But where is the use of these good early swarms if—after filling their hives, and we will premise all supers as well—through their industry the hives are too well filled with honey to be of much use for stocks for the ensuing season? I know of two straw hives, 21 inches diameter, quite full and heavy (as much as I could lift comfortably), and the swarms had only been hived a fortnight; then a nadir was placed under each of them, and if the proprietor only reaps the benefit of that nadir from each this season he will have no need to go to the stock hive for more. What is more difficult than to extract one or more bars from a stock hive that is full of bees? Am I to understand that Mr. Pettigrew advocates at a certain time after hiving the driving of a swarm from its then stock hive into another artificially, extracting the honey and comb from the first, and then returning the swarm to recommence their arduous labours, to rebuild their home, and re-stock it with a supply for their winter use? He likewise states that hives with 20 or 30 lbs. to spare in spring, in which the bees have been fed during the winter, do not yield large swarms. Now, by this I conclude that it would be best either to give the bees so much food that the hive shall not be increased in weight very much—that is, if food be found wanting, by weighing the hive; or to deprive them of at least 20 lbs. of honey, say in March. One would almost think that a hive strong in bees and heavy with honey would be the most valuable and most likely to yield a good return at the honey harvest by a goodly supply of supers. I have always understood the cry to be "feed! feed! feed!" late in winter and early in spring. Now, if we do, and the bees collect in food and honey 20 to 30 lbs., we sacrifice large swarms; if so, what course must be adopted to ensure that?—J. H. HOWARD.

[Mr. Howard has read my remarks very intelligently, and has stated his difficulties clearly enough. I am glad he has done so, for they will enable me to explain more fully the points noticed by him, which are important. We maintain that by the swarming system of managing bees better stocks for keeping can be had than on the non-swarming one. Let us suppose that Mr. Howard has two stocks ready to swarm about the end of May; ten days sooner or later will not disturb the argument. One stock yields a swarm which may be housed in an 18-inch hive;

the other is prevented from swarming by the use of supers, ekes, or a nadir. If supers be used the hives will be pretty well filled with honey, and the breeding space much contracted before the first super be filled. If the nadir process be resorted to instead of supers, the top hive will become the storehouse for almost all the honey the bees may collect. The nadir will gradually be filled with combs, and become the breeding-room; but unfortunately bees that are prevented from swarming generally and instinctively make far too much drone comb, which greatly impedes healthful progress. Nadirs are most advantageously used with early swarms of the current season, when both honey and stocks are aimed at from them. If I understand aright Mr. Howard's letter, the gentleman he alludes to has nadired two swarms of this year in 21-inch hives, which are already heavy. The top hives will, weather being favourable, become too full of honey for stocks, but will yield a large harvest of honey and honeycomb.

Now let us go back to the hive and its swarm. A second swarm may or may not be obtained. We take all the second swarms we can from hives that swarm in May. But suppose for a moment that the hive does not cast off a second swarm. All the brood in the old hive will be hatched about twenty-one days after the first left it. At this time the bees have no brood to attend to, and plenty of empty cells and bees to store honey in them. Such hives in good seasons rise in weight to 80 lbs., and sometimes more, and though too heavy for keeping are far better for stocks than those that never swarmed at all. We are now driving the bees out of our stock hives on the twenty-first day after swarming, and taking about 15 lbs. averagely of run honey from each stock. The quantity is unusually small, but the season has not been a favourable one. When the honey is thus taken the bees are put into empty hives, which they have to fill. As one stock hive is emptied it is refilled with the bees of another. These hives, filled with young combs and possessing young queens, generally make good stocks. We now come to notice the first swarm, which if obtained in May will in a favourable season for honey do better than and run before all non-swarmers.

If I am asked how it is that swarms invariably rise to greater weights than non-swarmers in honey seasons, I may not be able to give a satisfactory and philosophic reply; but the facts of fifty years' experience cannot be overturned by any philosophy. It is natural for bees to swarm, and to let them swarm is certainly and incontestably the surest and best method of obtaining and keeping good stocks. In the swarming system of management there are two or three hives full of bees at work, two or three queens laying, and any of the three hives under proper management is equal, we think better, for keeping than a non-swarmers. But one or two of them are marked for honey, and their bees united to the one that may be kept, thus making it doubly or trebly strong in bees. The apiary is thus kept full of hives with young queens and young combs.

When quite young we were instructed to look on non-swarmers as ineligible for stocks under ordinary circumstances, and at the end of a long and extensive practice we say that it is but seldom and with great reluctance we ever keep a non-swarmers another year. I thank Mr. Howard for his letter, and trust that both he and others will frankly and fairly state their opinions and perplexities.—A. PETTIGREW.]

### SPARROWS KILLING AND EATING BEES.

A few days ago Mr. Yates sent me the following letter:—"My brother has just returned from a visit to Doncaster, where he has been spending a few days. He remarks that when watching the bees he noticed the sparrows taking them. The sparrows perched on a tree near the hives, and suddenly darted and caught the bees. The birds carried the bees to the roof of the house, there killed them, and then carried them to their young. To be quite sure the gun was brought, and we soon had a good opportunity of shooting at a sparrow, which caught a bee and alighted on the ground; but, though the bird was hit and wounded, it flew away. On going to the spot a number of feathers were there and a bee—a drone, and so surmise the sparrows were catching drones only, which I believe they did at rather a considerable rate."

In confirmation let me say that on Sunday last I happened to be looking through a window at the bees working, when I observed two hen sparrows busily catching bees on the flight-board of one of the hives. Each bird jumped on the flight-board and caught a bee by the back, carrying it to the roof of the house. They soon returned for more, giving me ocular evidence of their destructive powers. I saw the sparrows jump off the flight-board with bees in their bills, and there kill and eat them. I was rather too far off to be sure whether the sparrows took drones only. I thought those that were killed and eaten in front of the hives were working bees. One drone I saw taken and carried away.—A. PETTIGREW.

P.S.—Since the above has been written I have seen hen sparrows again catching and killing bees, but have not yet suc-

ceeded in preventing the birds from carrying off their prey. If the sparrows take drones only we shall be grateful for their service; but if the working bees are thus destroyed, we shall endeavour to riddle the birds with sparrow shot.—A. P.

### AN EXTEMPORE BEE-TRAP.

We have this morning driven the bees out of a bell-glass super very successfully by the following method:—After setting the super on three inverted flower-pots, we placed over it a seakale-pot raised on two bricks. We then put on the cover of the pot and laid a piece of old sacking on the windward side. This was done just at 1 p.m. In about twenty minutes the bees began to clear off. A little before 2 p.m. as it came on to rain hard and scarcely any bees seemed to be coming from under the pot, we took off the cover and found not more than a dozen or twenty bees left in the glass. These were soon brushed out with a small feather, and in a little more than an hour from the time of its separation from the hive our booty was adorning the luncheon table. No doubt the risk of robbers was diminished by the day being dull, and consequently few bees being about.—A. O. N.

### OUR LETTER BOX.

**CHEAP POULTRY (H. P. B.).**—We know of no vendors of cheap poultry; every farmer sells mongrels at the market price. You must advertise, stating what you require.

**GUINEA FOWLS (Puzzled).**—You are on one point quite correct, although it was disputed for years, and is now by some fanciers. There is no doubt that Guinea Fowls pair. We are compelled to believe that the birds you have are both hens. All the little attentions you name may, under some circumstances, be practised by a hen assuming the plumage (as in other birds) and habits of the cock; especially is this the case in Spanish hens and hen Pheasants. The eggs laid by a hen "sole" would remain perfectly clear, because no germ of life exists. It cannot, therefore, be developed, and no corruption can follow. Such eggs would remain clear for any length of time, although under a hen.

**HAMBURG CHICKENS—PIGEON'S FACE WOUNDED (B. M.).**—You may feed the young Spangled Hamburgs as you would any others: boiled egg chopped fine, curd, bread crumbs, bread and milk, cooked meat chopped fine, and some beer to drink. You must dry the eruption on the face of your Pigeon with a sponge, and then burn off the excrescences as they appear with caustic. By drying we mean you must clear off all pus or moisture there may be under the crust or skin of the excrescence.

**SILVER-GRAY RABBITS.**—Mr. Firth writes, in reply to Mr. Savage, I never advised the breeding of the "too light-shaded Silver-Grays," which are "as objectionable as the dark shades." I maintain the opinion that no Silver-Grays with dark heads, feet, and tails should be an "exhibition standard;" but those which possess the true sharp silvery shade, beautifully and evenly interspersed with the blue-tinted sharp, and this exhibition shade I have always advocated. Mr. Savage says that Mr. Hudson's buck—prize buck "was none of the too light shade," and which was "as objectionable as the too dark shade." I presume the word "none" is a misprint for "now." [Yes.]

**Books (Fidget).**—Write to the author.

**JACOBIN LAYING SOFT EGGS (W. Carlton).**—Your bird is evidently improving, as the last egg had a shell, though a thin one. Separate her from the cock for ten days, and give her a small dose of castor oil, and feed her low. Soft eggs come from overfeeding, causing inflammation of the egg organs.

**HONEY FOR EXHIBITION (J. Marshall).**—If your swarm of June 5th has been put into a moderately-sized hive, it should be able to fill a super to hold 8 or 10 lbs. by the 25th of August. As soon as the hive is filled with combs, cut a hole 3 inches in diameter in the centre or crown of the hive, and place the super on and over the hole. The combs will not be damaged much by cutting such a hole. The super may be of glass, or wood, or straw; but glass supers require thick dark warm covers. If they do not have these the bees would do better in wood or straw. You ask if feeding will help your bees, and if it is possible to have two supers from your hive by feeding it well. We say yes to both questions, but feeding with sugar-syrup will not make honeycomb. You may speedily cause the swarm to fill its hive with combs by giving it plenty of much syrup; but if feeding be continued after the super is placed on the hive, it should be done with pure honey. Some time ago pains were taken to teach the readers of this Journal how to fill supers artificially and speedily. The process may be here repeated in a sentence easily understood: By placing or fixing plenty of white empty combs in the supers, and as soon as the bees begin to work in them give them good honey, or honey in old black combs, as fast as they carry it up. In this way supers of any kind may be filled.

**SUPPERING A HIVE (G. C.).**—The swarm which you found and hived may possibly fill a small super if the season be fine till the end. If a swarm fill its hive in four weeks, which is about the usual time in good seasons, it may be supered afterwards. Your swarm will make a good stock for keeping another year.

**MANAGEMENT OF A NADIR (E. R.).**—The top door of a nadir hive should be closed with a view to cause the bees the more readily to fill the nadir with combs. The nadir if well filled with worker-combs (not too much drone comb) will make a good stock for another year. Let all the bees be driven from the top hive into it when the honey is taken.

**TRANSFERRING BEES (G. S.).**—Your best time for transferring your bees from the old hive will be three weeks from the date of the issue of the first swarm. Probably before then you will have had a second swarm from the old hive. Should this occur before you see these lines you will doubtless have hived it in the "Neighbour" as you propose. If it should issue later, put the swarm in the old stock's place, and proceed to treat the old hive a day or two later as you propose doing, after giving time for the bees therein to return to their old place. You will not find many bees in it, but you can drive these together into a small hive or box, and set them immediately over the new swarm. Any brood which may be left in the old hive can be cut out carefully and given to any other hive to hatch out.

**OLD STOCKS NOT WORKING (H.).**—We should feel inclined to drive a swarm immediately out of the one, and put it in the old stock's place in a new hive;

then letting the old hive stand aside for a couple of days, till most of the bees had joined the swarm, we would shift away the other old hive, and put the deserted stock in place of it. A new queen would have to be raised, which would probably turn out a successful breeder, and so new blood would be introduced into your apiary; but you must feed up largely if necessary.

**CANARY MANAGEMENT (Waverley).**—You may remove the young Canaries from the old hen at the age of three weeks, so as to enable her to go on sitting her next nest of eggs without interruption from the young birds. They can be weaned off in the following manner. Cage off the young birds in a small wire cage, and hang the same close to the front part of the compartment in which the old birds are. Slightly open a couple of the wires of each cage, so that the cock parent can gain access with his head to feed the young. Supply the old birds with food, and likewise the young, which can be tempted to feed by putting additional small portions of egg and green food about the ends of the perches and other parts of the small wire cage, so as to attract them. In two or three days they will learn to feed themselves, when they can be safely removed. It is not of common occurrence for hen Canaries to lay ten eggs in fifteen or sixteen days. The hen having laid so many eggs within a given time was brought about through the force of circumstances. Very likely she would not have done so had she not been interfered with in some way. Some hen Canaries will not permit of liberties being taken with them. Naturally enough, where they have the opportunity, they often exercise a right of choice as to the position where to build and lay their eggs. We do not look upon the matter as an exceptional one. Most Canary hens, after constructing a nest and laying therein their eggs, would in a few days afterwards build and lay again, if such nest and eggs were interfered with. Five eggs each time is certainly a full complement. Sometimes they will lay six, and as many as seven eggs in a nest.

### REMARKS.

23rd.—Fair though cloudy morning; a pleasant day, but not very bright.  
24th.—A very bright day, but rather stormlike in the evening.  
25th.—Fair but dull in the morning; bright in the latter part of the day.  
26th.—A fine day throughout, a few drops of rain in the early part.  
27th.—Bright pleasant day, but rain after 9 p.m.  
28th.—Rain in the night and early morning, and more or less all day; a little gleam of sun just before setting, but heavy rain after.  
29th.—Damp dark morning, clearing off about 10 a.m., after which time it was very fine till about 7 p.m., when it again became dull and dark.  
About 3° warmer than last week; but by no means as warm as we frequently have at this season, the highest temperature in shade being only 76.8°—G. J. SYMONS.

### COVENT GARDEN MARKET.—JUNE 30.

SUPPLIES generally are very abundant, and soft fruit from Kent and other counties south and west are now consigned to a considerable extent. The Potato trade has become rather heavy, and reported arrivals large. Hothouse Pines and Grapes quite sufficient for the demand; the latter, however, does not comprise any extra samples.

## WANTED, INFORMATION ABOUT PEARS.

ONCE or twice it has been proposed in these columns to have an election of Pears on the principle of Mr. Hinton's excellently-conducted Rose elections, but the subject is full of difficulties, and our knowledge of it is evidently very imperfect. For my own part I am obliged to confess that I am miserably behind in the matter, and I am afraid, as the information is not forthcoming, that some of my *confrères* are not much better informed than myself. It is true we have the new edition of the "Fruit Manual," and the amount of information contained in it is nothing less than marvellous for the work of one man; but we want as many Dr. Hogges as we have members of Parliament, and all of them to be as fond of work as the original, before we can obtain the accurate information which I should like us to possess.

Perhaps it is impossible in our generation to obtain a perfect knowledge of the subject, but we can do something to make the task easier for our successors, and I would ask if it is not possible to conduct a series of observations extending over three years in every part of the country, with directions from head quarters? I would propose to take the Pear first, as I consider it the most useful of all outdoor dessert fruits, and it is the fruit on which our knowledge is the most imperfect. It is the most variable of fruits in different soils, seasons, climates, and on different stocks, and the usually-grown sorts vary from those which are good in almost all seasons and climates to those which are never good under any conditions.

Take up the most select catalogue of fruits for sale you can find, and looking over the names of Pears you are certain to find at least one or two which it is questionable if anybody ever saw good in this country. I never saw Duchesse d'Angoulême good, yet you will hardly find a catalogue without it. This, of course, is not the fault of the nurserymen; they must propagate that which they have a demand for.

Then there are some sorts which are all very well to look at, but are not fit to eat—Beurré Clairgeau and Vicar of Winkfield for example. Some sorts are improved by being grown against a wall, others are of better flavour from standards. I am inclined to think that all which will ripen without a wall are best without it. Some bear the best fruit on the extremities of the shoots, and therefore should not be pruned hard, as Jargonelle. Some will scarcely exist on the Quince stock, as Marie Louise; others are altogether indifferent as to what kind of stock they are on, as Glou Morceau; while others again are even said to be improved in quality by being grafted on the Quince. Some kinds bear in all seasons and climates, and are generally good, as Louise Bonne of Jersey; others bear a crop perhaps once in two or three years, as Williams's Bon Chrétien; and some, although they bear, are only first-rate occasionally, as Napoléon. Some kinds

are comparatively hardy and do well in the northern parts of the kingdom, and are perhaps best when grown there; others are only suited for the most favoured spots in the south and west.

Now, an average good gardener coming from Scotland to the south of England knows pretty well what Apples he can depend on, but in the matter of Pears he is all at sea; and the southerner going northwards would be in as great or a greater dilemma. Even different parts of the same county vary very considerably. We want then, when going to a strange place, to be able to lay our hands on a list of fruits which are known to succeed in that particular county in which we are to take up our abode, and it will at least be a little guide to the way in which we ought to conduct our experiments. If the list were compiled in the immediate neighbourhood by a trustworthy person, and on the same sort of soil as that with which we have to deal, of course it would be invaluable. It takes an average lifetime for one to obtain a perfect knowledge of the subject in any particular part of the country if he has no data to guide him, and then if he in turn does not put his experience on record his successors may have to go over the same ground, instead of being able to march onward as they ought to do.

It may be said that his successors should be guided by what they find doing well; and so they will if all belong to the intelligent class of gardeners; but, unfortunately, more than half belong to another class, and the chances are that in the present backward state of horticultural knowledge amongst the aristocracy, a good practical man may be succeeded by one who can use his tongue better than his spade, and the result of his predecessor's lifelong study and practice is speedily demolished. It is very sad when this is the case, but I am within the bounds of truth when I say it is actually happening every year. Oh that our great seats of learning would give a smattering of vegetable physiology and kindred subjects to their students! they would be doing greater good to mankind at large than by teaching heathen mythology. At present our gentry only find out by accident that such subjects as horticulture and arboriculture are interesting, and some of them do not find it out at all. I pity them. They miss seven-eighths of the enjoyments of this earthly paradise of ours. But to my subject.

I think it would be well to issue printed forms to all who care to have them to be filled up and sent in each year after the Pear season is over, say in May, something like the accompanying sketch. I should be glad if others would give their ideas and suggestions on the subject, and strive to awaken an interest in it. We want more precise information as to the average period of ripening the autumn Pears in each district; it is not enough to say a Pear ripens in September or October, because there are not many of the autumn Pears which last in condition more than ten or twelve days. There are far too many sorts in cultivation ripening at that time; we merely want to save the cream of them. A fruit must not only be good, it must be very superior to be tolerated at a season when it has so many competitors.

Name.	Stock.	How trained. If on wall, what aspect.	How pruned.	When gathered.	First six ripe.	Last six ripe.	Quality.
Fondante d'Automne ..	Quince	Pyramid	Mod. Autumn.	31st Aug.	12th Sept.	20th Sept.	Good.
Beurré d'Amanille .....	Quince	ditto	ditto	31st Aug.	12th Sept.	20th Sept.	Excellent.
Thompson's .....	Pear	ditto	ditto	19th Sept.	1st Oct.	30th Oct.	Excellent; very sweet. The best I ever tasted.
Vicar of Whitfield .....	Pear	ditto	ditto	4th Sept.	End Oct.	30th Oct.	Poor; dry.
Devenant du Comice .....	Quince	ditto	ditto	28th Sept.	15th Oct.	30th Oct.	Excellent; very fine white flesh.
Beurré superfin .....	Quince	ditto	ditto	Mid. Sept.	28th Sept.	18th Oct.	Excellent.
Ditto No. 2 .....	Quince	ditto	ditto	28th Sept.	10th Oct.	30th Oct.	Ditto.
Van Mons Léon le Clair.	Pear	South wall; Fan-trained.	Mod. above. Midsummer and Autumn	28th Sept.	13th Oct.	23rd Oct.	Large and good.

Soil—Heavy and shallow.

Subsoil—Stiff clay.

General Remarks—As a rule the Pears here seem to do best on the Quince, but Gloe Marceau, Thompson's, and Van Mons Léon le Clair are exceptions.

Address—Wm. Taylor, Longlat, Westminster, Wille.

Date—28th June, 1875.

We want also to know what kind of pruning best suits different soils and climates. I am under the impression that close pinching and hard pruning do not answer on strong heavy soils. There are very likely other points of importance which I have omitted in this hurried sketch. I have purposely omitted mentioning the geological formation, as that would add an insuperable difficulty to some persons, and it can easily be filled in by whoever undertakes to tabulate the information received; and I venture to say that if we can obtain a hundred returns from widely-distant parts of the country that I could find some one able and willing to weed them of all eccentricities of taste, and turn them to good account.—

WILLIAM TAYLOR.

## ROSES.

I HAVE been away for some little time on the Continent, and have been interested in reading-up on my return the numbers of the *Journal of Horticulture*, which I had missed during my absence. It is my intention, as soon as I can find time, to send a few remarks on the comparative merits of English and foreign gardening (as far, that is to say, as public parks and gardens are concerned), and shall expect my friend "D., Deal," will say, "What! John Bull again!" My object, however, in writing now is to make some few remarks on recent Rose communications from Mr. Camm and others. I can, to begin with, quite confirm one of our Editors' remarks, that there are no Roses so sweet with the real Rose fragrance as the old Moss and the Provence (common Cabbage), and I was very pleased to see a fine quarter of the old Moss at Battersea Park at the entrance near the York Road station, called, I think, the rosery entrance. Mr. Roger tells me he thinks they are some of the true old Moss left from the old nursery grounds which existed there before the park was made. On the first day I was there, a warm day after rain in the morning, the whole air was quite fragrant with them. I do not wish to take away from the merits of the Tea Roses,

with their peculiarly delicate and aromatic scent, but it is so very different from that of the Provence, Damask, Moss, and the generality of Hybrid Perpetuals as to be quite distinct in its way. The old Sulphurea odorata, called by some Crystal-line, with its long egg-shaped bud, and which I believe was the first Tea introduced into this country, and which I fear is now rarely to be met with, is still almost the sweetest in its class. Amongst others in the Hybrid Perpetuals one has not I think been named yet, and that is Senateur Vaisse, and I would also add François Lacharme, which is one of the sweetest of all the Hybrid Perpetuals, but, unfortunately, only a weak grower. After all, though fragrance adds much to the value of a Rose, yet when we come to decorate a room with Roses we should be sorry to cut out such Roses as Mme. La Baronne de Rothschild, &c., because they were deficient of scent, and we think far more of beauty of colour, form, freshness, to say nothing of size (which I still think a most important element so long as it does not lead to coarseness), than we do of the mere scent.

I am glad Mr. Camm has raised the question about cut-back Roses *versus* maidens. I am not an exhibitor, as I live too far north and too much away from Rose exhibitions to be able to send Roses for competition. I cannot, therefore, speak from my own experience, as I have never yet thought it worth while to try to compete with all the difficulties I should have to surmount. So long as the leading nurserymen bud so many Roses as they do every year on Dog Roses and Manetti, and pay but slight heed to their cut-back Roses, so long we shall be told that the only Roses fit for competition are those from maiden stocks. The fact is, transplanted Roses on Briar stocks have so much to contend with, that Roses on transplanted standards and half-standards are rarely, if ever, good enough for competition; but I am quite sure on ordinary good garden soil Roses that are well established on Manetti stocks properly pruned, well manured, and cultivated, will produce quite as good blooms and in far greater abundance than maidens. Roses, too, on their own roots, under proper cultivation, will also give quite as fine blooms as those on the Dog Roses. There are, however, heavy soils which are suitable to the Briar which will neither suit the Manetti nor Roses on their own roots, and when a lucky season comes then a quarter of newly-budded Briars on a clay soil will often carry all before them. The mistake, however, that is too commonly made is, that because a heavy clay soil suits a Briar, that consequently it is a congenial soil for the Rose; whereas it generally happens that the Dog Rose is the only stock that does any good on it, and that only when there is a sufficient amount of loam in the soil, or when plenty of vegetable matter is added by means of farmyard manure.

As I have before this ventured to state no one system did so much to prevent amateurs from growing good Roses as the plan which at one time so extensively prevailed, and which I am sorry to say has not yet been sufficiently discarded, of growing nearly all Roses in a garden as standards. At one time the only Roses to be seen in gentlemen's gardens were standard Roses planted, perhaps, on the grass on each side the principal paths, or with little circles cut out of the lawn in which annuals and other plants were grown. The whole system of pruning which standards had to undergo in order to make symmetrical heads is so contrary to the natural growth of the Rose as almost of itself to militate against the production of really good Roses. Then, again, most garden soils are not suitable to the Briar, and out of a hundred standards sent out by nurserymen not more than half, or perhaps I might be nearer the mark if I said a quarter, have really had any attention paid to that most necessary article the roots. They are generally cut out of hedgerows by men in winter time when they may run short of other work, and so long as they have a good straight stem they care very little how much root they have. The consequence is a great proportion of the stocks when planted never recover the rough treatment, some die altogether, some eke out a lingering existence, but all that are able to push any shoots are budded, and in the course of another season are again transplanted when ordered by gardeners or gentlemen from the nurserymen, and have their powers of endurance again tested.

I am glad to say that the Manetti, the seedling Briar, and Roses on their roots are gradually getting the better of these old standards; but so long as the standard is adopted as the general system, so long cut-back Roses will be at a discount, and gentlemen will be under the impression that they cannot grow Roses or that their soil is not suitable for them. When

they see their own Roses grown on transplanted standards, and compare them with the grand display now made on the exhibition stands by our leading nurserymen and amateurs, Mr. Camm has, I think, consequently done good service by calling our attention to cut-back Roses.

I should like much to have inquired at the Alexandra and Crystal Palace Rose Shows how many of the blooms exhibited by the amateurs were from old-established plants. I certainly do not ever remember to have seen a better collection of amateur Roses taken as a whole than those shown by the amateurs at the Crystal Palace. The nurserymen were in high force, and I do not think I ever saw a better seventy-two than those which Mr. G. Paul staged, and which carried off the premier prize; but when we consider that the generality of amateurs only cut from a comparatively small number of Roses, I think that the Roses shown by the amateurs on Saturday, 26th of June, at Sydenham were quite as meritorious in their way as those shown by the nurserymen, and the majority of the blooms were quite equal in their way to those in the nurserymen's classes. If, as I fancy, the majority were from cut-back Roses, it would help materially to confirm Mr. Camm's remarks.

What shall I say about the much-vexed question as to the merits of *Mme. Lacharme*? I am inclined to think that neither "*D. Deal*," nor Mr. Camm is right: that one exalts it too highly, while the other pulls it too much to pieces. It is undoubtedly a good pot Rose, but it is too delicate and flimsy in the petals for ordinary garden purposes. It puts me somewhat in mind of *Miss Ingram*, which also was equally highly extolled and as much declaimed, and which still is a good Rose when caught at its best, much as I expect *Mme. Lacharme* will be. Certainly a box of it at the Alexandra Palace was worthy of high commendation.

French raisers of Roses will have to look to their laurels. The last three years have given us but very few worth anything. Take *Etienne Levet*, *François Michelon*, and a few others out of the list, we have a great deal of trash, as *Abbé Brammerel*, *Maxime de la Rocheterie*, and others to place against them. Why I name this is that some of the recent English-raised Roses, as *Cheehunt Hybrid*, *John Bright*, *Duchess of Edinburgh*, *Emily Laxton*, *Mrs. Laxton*, *Oxonian*, and others seem likely to be taking precedence over the foreigners.

While on the subject of Roses may I press upon nurserymen in preparing their catalogues to give the name of the raisers to their Roses, not merely in those cases where there are two of the same name, as *Duchess of Edinburgh* of *Veitch's* and *Bennett's*, but because it is only fair upon those who have furnished the public with the best Roses to have their names honourably mentioned, and it also might help as a check, which is much wanted, against worthless novelties?

I must conclude by saying I was much amused by Mr. Radcliffe's idea of button-hole Roses. I wonder he did not add *Baronne Prevost* and *Felix Genaro*, to say nothing of *Mme. Masson*. *Mais chacun à son goût*.—C. P. PEACH.

### DR. RODEN'S STRAWBERRIES.

MORRINGSIDE is the residence of Dr. Roden of Kidderminster, who frequently contributes to the pages of your Journal, and who is quite a professional in many branches of horticulture, and whatever he undertakes he generally carries out to perfection. Notably at present are his Strawberries, which are a sight worth going miles to see, and anyone interested in the culture of that delicious summer fruit will have ocular demonstration of what can be done with them. Dr. Roden has made the cultivation of the Strawberry and raising of seedlings his study for years, and has been successful in raising a number of seedlings which bid fair to take the field against a great many existing varieties.

Early Prolife and Duke of Edinburgh were sent out some years ago, and I have proved them to be excellent for forcing. Early Prolife I consider a first-class Strawberry for forcing in every point of merit, to be succeeded by Duke of Edinburgh. These have taken the place of *Black Prince* and *Keens' Seedling*, with me the former being so liable to mildew, and the latter in many cases a great many of the plants prove barren; but the Doctor is bringing out another Strawberry which is earlier than either of the above, and a grand cropper; he names it *Alpha*. Amongst early Strawberries he has also *Amy Robsart*, *Early Crimson Pine*, and *Hundredfold*, the latter properly named, for it is a mass of fruit all round the plant, and has a good constitution. There are also to be seen his eight-year-old *British Queens*, about 5 feet through, and supported with

crinollines completely covered with fruit. The Doctor has also a great many other mid-season seedlings, and also very late seedlings, a later than any we have at present in cultivation is a desideratum which I hope the Doctor will be able to supply; and this is not the only branch of horticulture in which the Doctor excels, for in fruit trees he has a splendid collection of all the best sorts of Pears, Apples, Plums, &c., models of good training, and by judicious treatment, such as root-pruning, summer-pinching, &c., he is generally able to secure good crops of fruit.—J. A., *Hill Grove*.

### THE MIDLAND COUNTIES HORTICULTURAL EXHIBITION, BIRMINGHAM.

In the Lower Grounds, Aston Park, this great Show was opened on the 1st inst., and continued for four days. The laudable object of Mr. Quilter in seeking to benefit a worthy institution, his encouragement of popular gardening, his administrative ability and liberal recognition of all who aid him, secured the response of a wide range of cultivators, and the result is a display of the best products in the different sections into which the Exhibition is divided. The past history of these Shows and their great success has raised them far above a local character, and we are glad to say their reputation is sustained. The display this year is in most points equal, and in some superior, to the gatherings of past years. The plant department is full and fine, the Roses and cut flowers extensive, the vegetables of the first order of merit, and the fruit of excellent quality, but does not perhaps afford such an imposing display as did this section last year. Implements and appliances are also extensively represented by the principal firms of the country. The Rose tent, which also contained other cut flowers, plants, fruit, and vegetables, is 300 feet in length by 45 feet in width. A covered corridor, 60 by 45 feet, containing *Pelargoniums* and *Ferns*, leads to the tropical plant tent, which is 300 feet in circumference. The specimen plant tent is 136 by 80 feet, and there are thirty allotments of space for implements. These are all filled, and, excluding other conveniences, give a fair outline idea of the extent of the Exhibition. Taking the classes in their order of arrangement we commence with the

SPECIMEN PLANTS, and find collections of great cultural and decorative merit. The plants are arranged on turf banks—a large central oval and marginal tiers. In Class 1, for sixteen stove and greenhouse plants in bloom, the competitors are Messrs. Cole & Sons, Withington, and Mr. Cypher, Cheltenham. Messrs. Cole won the £25 prize, and being the second time they have achieved this honour, the silver challenge cup in addition becomes their own. Their plants were not only large but in admirable condition of health and freshness. Some of the best were a grand *Hedera* *multiflora*, a perfect globe of fully 6 feet in diameter; huge and densely-bloomed *Azaleas*, two very fine *Allamandas*, *A. grandiflora* being exceedingly effective; a remarkably fine plant of the old *Vine* *oculata alba*, very fine *Ixoras*, *Ericas Cavendishiana* and *Candolleana*, very large; and *Parmentieriana* roses, excellently shown; a capital *Phenocoma*, a good *Anthurium Scherzerianum*, &c. This was a valuable, well-grown, and well-arranged collection. The second-prize plants, Mr. Cypher's, were in health and arrangement in no way inferior to the above, but were not so large. They were, however, fine and admirably grown specimens, the most striking being a brilliant *Combretum* clothed in rich deep scarlet; very fine *Allamandas*, *Francoacea eximia*, very telling; *Clerodendrum Balfourianum*, extra fine; a fine *Kalosanthus*, *Genetyllis*, *Ericas*, &c., a fresh and beautiful collection which anyone may be proud to own. The next class for twelve plants in bloom brought out some superior examples of culture. Messrs. Cole and Sons again had the post of honour, followed respectively by Mr. Cypher and Mr. Perkins, Leamington. Messrs. Cole's was a fine group, *Ixoras Coleii* and *Williamsii*, *Ericas Massoni* major and oblate, a good *Bougainvillea*, *Allamanda*, and *Azaleas* being the most striking. The cream of Mr. Cypher's were *Allamanda grandiflora*, very bright; *Dipladenia amabilis*, *Ixoras*, *Phenocoma*, *Statice*, and *Dracophyllum*, all uniformly excellent. Mr. Perkins having as the best a very fine *Dipladenia*, and immense *Statice imbricata* and *profusa*, very attractive and good. The individual excellence of the plants in these classes was very remarkable, and their freshness for the period very noteworthy.

The next was an amateurs' class for ten stove and greenhouse plants in bloom, and was filled with four collections of rare excellence. The first prize of £12 went to Mr. Chapman, gardener to J. Spode, Esq., Hawkesyard Park, with elephantine plants in capital order. *Bougainvillea glabra* was 5 feet through and densely bloomed; *Clerodendron Balfourianum* and *Phenocoma* being equally large; *Ericas Parmentieriana* and *Aitoniana* were very fine; with *Ixora*, *Dracophyllum*, and *Statice*. Mr. Pilgrim, Fairlawn, Cheltenham, had the second place with a splendid lot containing one of the finest plants of *Anthurium Scherzerianum* ever seen, a perfect model of sixty bright spathes; his *Stephanotis*, *Erica ventricosa* major, *Genetyllis*,

and *Phenocoma* were also admirably grown. The third prize was worthily won by Mr. Parkes, gardener to J. Marriot, Esq., Warwick Green, Coventry, with a group of beautiful and well-finished plants. *Sobralia macrantha* was 4 feet through; and equally well set up were *Eucharis amazonica*, *Oncidium flexuosum*, *Dipladenia* and *Statice*, and other remarkably good medium-sized plants. A fourth prize was deservedly awarded to Mr. Tudgey, gardener to J. F. Williams, Esq., Henwick Grange, Worcester. The growers of the plants in this class are to be complimented on the results of their skill, and each richly deserve the honours they have won.

The next was an open class for the best specimen stove plant in bloom. There were eight competitors. First honours fell to Messrs. Cole & Sons for a grand plant of *Ixora Coleii* 5 feet high and 4 feet through, a dense mass of white blooms. Mr. Foster, gardener to E. Greaves, Esq., Avonside being second for a plant of the same size of *Stephanotis* in fine health and bloom. Mr. Webb, gardener to J. Gulton, Esq., Warwick Green, Coventry, being third also with a *Stephanotis* not so large as the preceding, but with better foliage and finer flowers. Neither of these plants, however good as they are, evidenced such skill in growing as Mr. B. S. Williams's fine *Anthurium*; but, possibly by being a little past its best, it could not win a place, which proves how good the winners were. For the best specimen greenhouse plant Mr. Webb was first with a well-grown specimen 4 feet in diameter of *Bouvardia angustifolia*; Mr. Chadwick, gardener to C. Nelson, Esq., Crackley Hall, Kenilworth, having the second place with a fairly good *Statice*. There were six competitors, but except the winners the plants were only of moderate quality, and the third prize was justly withheld.

We now come to the fine foliaged plants, and although some very good specimens were staged, the plants generally in these classes were not of extraordinary merit. In the nurserymen's class for nine plants Messrs. Cole & Sons had the first place with *Phormium tenax variegatum*, *Yucca aloifolia*, a good *Dasyliiron*, *Croton pictum*, and Palms; Mr. Cypher being second with smaller but generally brighter plants, *Euria latifolia variegata*, *Phormium tenax variegatum*, *Yucca aloifolia*, a *Dracena*, *Croton*, and Palms constituting the best of the group. In the corresponding class for amateurs were some very beautiful plants, the first-prize collection from Mr. Foster containing some remarkable specimens. The most striking of all was a noble plant of *Cycas revoluta*, 8 feet across, in robust health, and with a globe of fruit in the centre a foot in diameter; he had also *Croton angustifolium* and *pictum* in pyramids of 8 feet in height, a beautiful *Encephalartos villosus* with a severed bloom spike attached, *Phenocophorum seychellarum*, and *Areca Verschaffeltii* in perfect health. Mr. Pilgrim had the second place with, amongst others, a capital *Dasyliiron acrotichum*, a nice *Croton Weismanni*, *Thrinax elegans*, and a well-coloured *Phormium*. Mr. Brown, gardener to Mrs. Alston, Elmton Hall, Birmingham, was third; his collection embraced a very fine *Gleichenia semivestita*, *Phormium tenax variegatum* throwing up a spike of bloom, and an exceedingly good *Caladium*. In the nurserymen's class for six plants Mr. Cypher was first, and Messrs. Cole and Sons second, with plants not greatly differing from those in Class 9. In the amateurs' sizes Mr. Pilgrim was placed first; Mr. Jones, gardener to C. E. Matthews, Esq., second; and Mr. Brown, Elmton Hall, third. Mr. Pilgrim had besides the plants previously enumerated a very good *Cordylina indivisa*, a fine *Encephalartos*, and a capital *Theophrasta*. Mr. Jones had some very nice specimens of *Euterpe edule*, a well grown *Caladium Belleymeyii*, *Araucaria excelsa*, and a good *Latania borbonica*. Mr. Brown's plants were smaller, but equally well grown, with those in the other collections. In the open class for the best specimen fine foliaged plant, Messrs. Cole & Sons had the first place with a remarkably healthy *Cocos Weddelliana*, Mr. Cypher being second with a smaller plant of the same beautiful Palm, Mr. Parkes having the third place with an excellent *Alcaesia macrorhiza variegata*, very clear and pure in its markings, and altogether a good plant. In this class were six competitors. For six *Dracenas* Mr. B. S. Williams was placed first, Mr. Brown second, and Mr. Matthews third. Some of the plants were very good, but the collections did not equal those of Mr. Bull and Mr. Willis at the late Crystal Palace Show. For the best specimen *Croton* Messrs. Cole & Sons won with a grandly coloured *C. angustifolium*. One could not but feel that the name of the Golden-fountain Plant was very appropriate. When well grown this old favourite is still one of the most beautiful, as it is certainly the most elegant of all the *Crotons*. Mr. Cypher had second honours with a fine plant of *C. longifolium* extremely well coloured, Mr. Parkes being third with a capital plant of *C. Weismanni*.

**FERNS.**—In these classes were many exceptionally fine plants. In the nurserymen's class for eight plants Mr. B. S. Williams and Mr. Cypher were awarded equal first prizes, and well they merited the honour. Mr. Williams had his fine *Alsophila*; he had also an excellent *Cibotium*, very fine *Gleichenias*, a beautiful plant of *Davallia Mooreana*, *Marattia elegans*, and a very good *Adiantum farleyense*. Mr. Cypher had *Cibotium princeps*,

*Gleichenias speluncæ* and *dichotoma*, *Neottopteris australis*, admirably grown, also a very good Silver Fern. These were very fine groups, as also were the following in the amateurs' class:—For eight plants were seven competitors, first honours falling to Mr. Brown, Elmton Hall, for a splendid collection. *Todea superba* was in a rare state of perfection. The silver *Gymnogramma peruviana* and the gold *G. chrysophylla* were capitally grown. *Davallia Mooreana* was very fine, *Leucostegia immersa* 6 feet over, and a large *Gleichenia* were the most striking plants. Mr. Jones, gardener to E. E. Matthews, Esq., had the second place with a collection of level excellence; Mr. Colman, gardener to W. Baylis, Esq., Walsall, being placed third with very good plants. For the best pair of tree Ferns Mr. B. S. Williams was without a rival with plants of *Dicksonia antarctica* 10 feet high, and with trunks more than a yard in circumference. For six *Cycads* Mr. Williams was first with a striking collection in remarkable health of *Encephalartos horrida*, *Lehmanni*, *Ghelinoki* and *villosus*, *Dion edule*, and *Cycas revoluta*. Mr. Pilgrim being second with healthy medium-sized plants. For the best specimen Fern, *Adiantum* excluded, Mr. Williams won with his noble plant of *Alsophila australis* Williamsii, the most distinct and beautiful of all tree Ferns, the fronds of which assume the graceful weeping character on plants in a young state. It is an important acquisition to a valuable class of plants. Mr. Brown, Elmton Hall, was second with a very healthily-grown *Dicksonia*; Mr. Quarterman, gardener to T. Gladstone, Esq., Edgbaston, having the third place with a nice *Alsophila australis*. There were eight competitors. Eight also competed for the best *Adiantum*, Mr. Cypher being first with a grand *A. farleyense* fully 4 feet through; Mr. Parkes having the second place with a plant of the same nearly as good; Mr. Peavor being third with *A. cuneatum*. For twelve hardy Ferns fine collections were staged. Mr. Moreley, gardener to J. E. Mapplebeck, Esq., Birmingham, winning the first place with splendid plants of *Athyrium Filix-foemina* var. *robusta multifida*, 6 feet over; *Lastrea cristata*, fronds 3 feet in length, and the plant 4 feet through; *Athyrium Filix-foemina* Elworthii, very beautiful; *A. Pritchardii* and *A. coronatum*, finely crested; and a beautiful *Polystichum angulare* var. *proliferum Wollastonii*. Mr. Brown, Elmton, had the second place with healthy medium-sized plants of *Scelopendrium*, *Athyrium*, &c.; Mr. Coleman being third, his noticeable plant being *Onoclea sensibilis*. The Ferns in these six classes alone numbered 199 plants, and scarcely an inferior one was to be seen. In contrast was the following class for

**THREE PITCHER PLANTS.**—Only two competed, Mr. Tudgey, gardener, Kenwick Grange, being first with *Nepenthes Hookeriana* and *distillatoria*, and *Sarracenia purpurea*; Mr. Williams having the second place with a trio of better quality of *Nepenthes Sedeni* Hookeriana and *phyllanthora*. Neither were the Heath classes remarkable for fine plants. In the nurserymen's class for six *Ericas* Mr. Cypher was placed first, and Messrs. Cole & Sons second. *Eximia superba*, exquisite, *Massoni major*, and *Parmentieriana* were the smallest plants and the best. In the corresponding amateurs' class better plants competed. Mr. Pilgrim had the first place, *E. Lindleyana*, oblate, and *ventricosa* being good, with a nice plant of *ferruginea major*. Mr. Tudgey was second with small and medium-sized well-grown plants. Mr. Chapman being third with larger but looser specimens.

**PALMS.**—In the nurserymen's class for six plants good collections were set up by Mr. J. H. Ley, Croydon, and Mr. B. S. Williams, who had first and second prizes in the order named. Mr. Ley had *Martinezia Lindenii*, *Latania borbonica*, *Thrinax elegantissima*, *Chamerope tomentosa*, *Astrocaryum mexicanum*, and *Acanthoriza*; Mr. Williams having *Sabal Blackburniana*, *Areca lutescens*, *Phenocophorum Seychellarum*, *Astrocaryum*, *Chamerope*, and *Latania*. All the plants were healthy and fine, and so equal in point of merit that they might fairly have had equal awards. In the corresponding class for amateurs Mr. Pilgrim, Cheltenham, had the first place with well-grown glossy plants of medium size; Mr. Brown, Elmton, being second with a nice collection.

For six new and rare plants sent out in 1873, 1874, or 1875 there were seven competitors, Mr. B. S. Williams being placed first, Mr. Cypher second, and Mr. J. H. Ley third. Amongst the most noticeable were, in Mr. Williams's group, an excellent *Dracena Baptistii*, *Croton majesticum*, *Dipladenia Brearleyana*, a fine *Cyathia Dregii*, and *Bertolonia Van Houttei* in splendid form and colour. Mr. Cypher had as the best *Dipladenia Brearleyana* very good, *Phyllotantium Lindenii*, *Croton majesticum*, *Ficus Parcellii*, *Aralia Veitchii*, &c.; Mr. Ley having a *Dion*, *Zamia*, *Croton*, &c. Messrs. Barron & Sons' choice collection of new Conifers in this class attracted considerable attention.

**ORCHIDS.**—These were not largely represented. In the open class Mr. Williams was the only prizetaker. Amongst his ten plants were *Vanda Batemanii* with a fine opening spike, *Aërides odoratum majus* with sixteen racemes, *Pilumna fragrans* with four fine spikes, *Aërides Larpentæ*, *Odontoglossum citrosum*, *roseum*, *Lælia purpurata*, &c. In the next class for six plants

Mr. Williams was again without a rival. Besides duplicates of those above named, he had *Aërides virens* Ellisii with two beautiful racemes, *Dendrobium*, *Pterardia latifolia*, the two main spikes having each forty flowers; *Dendrochilum filioforme*, a *Masdevallia*, and *Cypripedium*. These classes were a magnet point of interest to the visitors, the quaint and beautiful flowers showing to advantage amongst the Ferns and Palms.

GLOXINIAS were not good, having being injured in transit. The first award went to Mr. Coleman, Walsal, who had very nice examples of Queen Victoria, Pink Perfection, Queen of Portugal, and *Oerise Unique*; Mr. Webb being placed second with larger plants of inferior varieties.

SUCCULENTS.—The class for twenty-five varieties of these interesting plants brought out two beautiful collections from Messrs. James Dickson & Sons, Newton Nurseries, Chester, who had the first prize, and Mr. Pilgrim, Cheltenham. Messrs. Dicksons' group consisted of *Agaves coccinea*, *applanata*, *dealbata*, *ferox*, *univittata*, *Verschaffeltii*, *Richardii*, *amœna*, *horrida*, *Celsii*, *corulescens*, &c., with *Opuntia cylindrica cristata*, *Echinocactus hamatus* and *E. electracanthus*, *Melocactus corymbosus*, &c. The most striking in Mr. Pilgrim's group were *Echeveria pulverulenta* and *Aloe grandident*. Than these plants nothing in this Exhibition was more greatly admired, and the cultivation of plants so thoroughly distinct can hardly fail to become more general. They afford an enjoyable change from the richness of flowering plants and the elegance of Ferns, and the longer they are grown the more ornamental and valuable they become. We now come to plants of a directly opposite character—viz.,

FUCHSIAS.—The classes for these elegant plants were well filled, and very fine but not gigantic specimens were staged. For the best nine plants the first prize was awarded to Mr. Caldwell, gardener to W. Matthews, Esq., Edgbaston, Mr. Cusdon being second, and Mr. Quarterman third. The plants were not closely trained, but were mostly of a pyramidal shape, and in excellent health. Out of the seventy-five plants the best were the old *Venus de Mediol*, *Lustre*, *Wave of Life*, *Senator*, very fine; *Annie*, *Marguerite*, *Princess Beatrice*, *Roderic Dhu*, extra fine; *Miss Marshall*, *Nabob*, very good; *Blue Beauty*, *Improvement*, splendid flowers; and *Noblesse*. These were generally exhibited better than were the

PELAGONIUMS.—In the open class for six Show varieties Mr. Turner, Slough, had the first place, Mr. Chadwick being second, and Mr. Quarterman third. The plants were about 2 feet in diameter, with good flowers, but were somewhat drawn by having been retarded in the shade. For the best collection of twenty plants the awards were the same. These were nice plants from 18 inches to 2 feet over. The best varieties were *Scottish Chieftain*, very rich; *Blue Boy*, distinct; *Duke of Cambridge*, bright; *Patriotic*, *Protector*, *Highland Lassie*, *Claribel*, the best light variety; *Victory*, *Juno*, *Brutus*, and the best of all, *Ruth*. For the best six Fancies Mr. Turner was again placed first, and Mr. Quarterman second with plants calling for no comment. In the Zonal classes were very good naturally-grown globular plants, which is a more agreeable form than the pancake mode of training which is often adopted. The best nine plants came from Mr. Cusdon, Mr. Quarterman being second, and Mr. Kimberley, Stoke Nursery, Slough, third; and for six Nosegays, or hybrid Nosegays, the awards went to Mr. Cusdon and Mr. Quarterman. For six gold or silver Tricolors Mr. Dobbin, Worcester, Mr. Waters, and Mr. Turner were placed in the order named; Peter Grieve and W. Sanday in Mr. Turner's group being the brightest and best. In the Bicolor or Gold-and-bronze class the awards went as follows: Mr. Dobbin first, Mr. Pache second, and Mr. Coleman third. The plants generally were not superior, and further, they were staged too high to be seen to advantage. The prizes for Doubles were won—first by Mr. Chadwick with compact plants, *Double Tom Thumb* being remarkably good; and second by Mr. Perkins with large straggling specimens.

In the miscellaneous classes Mr. Vertegans worthily had extra awards for groups of tropical plants and Conifers of great merit. Mr. Williams had also an extra award for a very beautiful mixed group, the centre plant being a fine *Anthurium*, surrounded by Ferns, Palms, *Sonettias*, *Dracenas*, *Crotons*, *Cypripediums*, &c. Messrs. Veitch & Sons had also a rich display, worthy alike of the admiration they received and of the reputation of their name. Amongst them were *Nepenthes* of rare excellence, remarkably fine *Gloxinias*, *Sarracénias*, *Bertolonias*, Ferns, *Agaves*, with *Dracena hybrida* in splendid colour; this fine hybrid should be in all collections. Mr. Corp, Oxford, had beautiful Tea-scented Roses, *David Pradle* evidencing great merit as a rich pink for button-hole purposes. We must notice a handsome gold Fern, *Gymnogramma Alstonii*, from Mr. Brown, Elmdon Hall. It is most distinct and beautiful, the pinnae turning upwards and showing a portion of the under surface, giving the plant the appearance of being spangled with bright gold. It is a distinct and valuable Fern, which Mr. Brown may be proud to own. We close our notes on the plants by an allusion to a remarkable specimen of *Fancy Pelargonium Illuminator* from Mr. Fleming, gardener to R. Hington, Esq.,

Liverpool. It is a marvel of good culture, being a pyramid about 5 feet in height and 4½ yards round the base by admeasurement. It is in perfect health, and covered with flowers and opening buds. Probably it is the finest plant of the kind which has ever been exhibited. We now glance briefly at the

ROSES.—The best varieties for exhibition purposes were so fully noticed last week at the Crystal Palace and the Alexandra Palace Shows, that an enumeration of the Roses now exhibited would amount to little more than a repetition and could serve no useful purpose. Many blooms had been injured by the rains, but yet some grand boxes were exhibited. In Class 47, for seventy-two single blooms, for £10 and the twenty-five-guinea silver challenge cup, Messrs. Cranston & Mayos, King's Acre, Hereford, won with a collection such as has seldom been equalled. In size, colour, and freshness they were alike excellent. In this class also the champion Rose of the Show, for which a special prize was offered by T. Laxton, Esq., Stamford, was selected. It was a magnificent *Senateur Vaise* to which this high honour was awarded. Mr. Cant was placed second; Messrs. Paul & Son third; and Messrs. Whitten & Davison fourth. There were three other competitors. For forty-eight varieties, three trusses of each, Mr. Turner, Slough, won with grand blooms of uniform excellence. Messrs. Cranston & Mayos were second, and Messrs. Paul & Son and Mr. Cant being equal third. This was a glorious class, massive and brilliant. For twenty-four Hybrid Perpetuals of three trusses each, were thirteen competitors, Mr. Prince, Oxford, winning with a princely contribution, the other awards going to Mr. Cant, Messrs. Cranston and Mayos, and Mr. Turner in the order named. In the nursery-men's class for twenty-four single blooms fifteen competed, the honours falling to Mr. Turner, who staged really grand blooms; Mr. Prince, Messrs. Cranston & Mayos, and Mr. Cant respectively. In the class for twelve Tea-scented Roses Mr. Cant won, followed by Messrs. Paul & Son and Mr. Prince in the order named, who all staged boxes of superior merit. We now come to the amateurs' classes. For the best forty-eight single blooms the first prize and the twenty-five-guinea silver challenge cup was won by Mr. Davis, Wilton, Salisbury, with an extraordinary fine collection. Mr. Baker, Heavitree, being second with blooms a trifle too much expanded, but splendid in colour and foliage; Mr. Staite, gardener to the Rev. C. Evans, Solihull, was third; Mr. Laxton having the fourth place. Fourteen competed. For thirty-six blooms twenty entered the list, the honours being won in the order following—Mr. Mayo, Oxford; Mr. Davis, Mr. Evans, and Mr. Brown. In Mr. Mayo's collection was a lovely bloom of *Miss Ingram*, all the boxes being very good. For twenty-four blooms were no less than twenty-seven competitors, Mr. Parnell, Rugby, winning first honours with a grand lot; Rev. C. Evans being second; Mr. Davis third; and Rev. W. Benn, Churchover Rectory, fourth. For twelve blooms were twenty-five competitors, Mr. Parnell being placed first; Mr. Jowitt, Hereford, second; Mr. Staite, Solihull, third; and Mr. Gould, Mortimer Vicarage, fourth. The merit in this class was as great as the competition. For twelve Tea-scented Roses fourteen competed, first honours going to Mr. Jowitt, second to Mr. Laxton, third to Mr. Mayo, and fourth to Mr. Evans, with lovely blooms of popular varieties.

For the best twelve Roses of 1872, 1873, or 1874, Mr. Turner won first honours, followed by Messrs. Paul & Son, Mr. Cant, and Messrs. Cranston & Mayos in the order named. Fourteen competed. For six blooms of the same years Mr. Cant was first, Messrs. Cranston & Mayos second, Messrs. Paul & Son third, Mr. Corp fourth. In the above classes many grand Roses were shown, Mr. Laxton having the best blooms of *Madame Lacharme* we have yet seen. In the open class for twelve single blooms Mr. Corp was placed first, Messrs. Cranston & Mayos second, and Mr. Turner third. For twenty-four pot Roses Messrs. Paul & Son had no rivals. In the classes for twelve blooms of special standard varieties Mr. Paul was first for *Alfred Colomb*; Cranston & Mayos and Messrs. Paul & Son being respectively first and second for the *Duke of Edinburgh*; Mr. Jowitt and Messrs. Perkins & Sons for *Madame La Baronne de Rothschild*; Mr. Turner and Messrs. Davison & Whitten for *La France*; Messrs. Paul & Son and Mr. Turner for *Marie Baumann*; Mr. Cant and Mr. Turner for *Maréchal Niel*; and Mr. Cant and Mr. Turner for *Devonensis*. Some of the collections were not super-excellent, while others, and especially those last named, were very fine indeed. In this show of Roses over five thousand blooms were exhibited, many of them of the highest quality, and not surpassed by any show of the season, except, perhaps, that at the Crystal Palace. It was a great and grand exhibition, and received the lion's share of attention by the general visitors.

In the nursery-men's class for eighteen bunches of cut flowers Messrs. Cole & Sons were placed first, Mr. Perkins second, and Mr. Kimberley third; the corresponding class for amateurs bringing to the front Mr. Chapman, Mr. Fox, and Mr. Webb. In the open class for eighteen bunches of hardy flowers Mr. Perkins was first, Mr. Chadwick second, and Mr. Kimberley third. Than these collections perhaps none more beautiful have

ever been staged. For Carnations and Picotees Mr. Turner, Slough, and Mr. Hooper, Bath, were the successful competitors. Bouquets were well represented, twenty-six competing "bridal" and "opera." For the best bridal bouquet Mr. Perkins was first, Messrs. Feltos & Sons second, and Messrs. Turner Brothers, Basnett Street, Liverpool, third. They were admirable examples of tasteful arrangement, but were fully too large. For the best opera bouquet Messrs. Pope & Son were first, and Mr. Cypher second, with artistic combinations of choice flowers, Messrs. Feltos & Sons being third; an extra being awarded to Mr. Jackson. Some of these were too heavy, but on the whole they were admirably set up.

The arrangements of flowers for table decoration were an excellent display, there being thirty-two glasses, none of them being inferior, while most of them gave evidence of consummate taste. For three pieces arranged for the table Mr. Cypher was first; Mr. Cook, gardener to Mrs. Abercrombie, Cheltenham, second; and Mr. Jackson third. For a centre-piece Mr. Cypher was again placed first, Turner Brothers second, and Mr. Jackson third. Grasses played a very important part in these masterly arrangements. For the best button-hole bouquet twenty-three competed, Messrs. Pope & Son being placed first for the smallest and best, Mr. Finch being second, Turner Brothers third, and Mr. Cypher fourth. A small Rose bud, a sprig of Forget-me-not and Bouvardia, with a little Fern, found most favour with the Judges and public alike. In the class for skeleton leaves Mr. John Kaye, Didbury, Manchester, exhibited six stands, and had the first and only prize awarded. If the three prizes had been grouped in one it would have been no more than this exquisite collection merited.

#### FRUIT.

Commencing with Pines we find for two Queens, that Mr. Meredith, gardener to Viscountess Downe, Baldersley Park, Thirsk, secures the first place with handsome, plump, fine-conditioned, small-crowned fruit; Mr. Miles, gardener to Lord Carrington, Wycombe Abbey, being second with fully as large but not quite such perfect fruits. For the best fruit of any other variety Mr. Coleman had the first award for a large fruit of Providence. For the best six Pines Mr. Meredith was again in the front place with beautifully ripened medium-sized fruit, Mr. Miles being placed second. The Pines generally were useful well-finished table fruit, of which twenty-four were exhibited.

Grapes, of which sixty bunches were exhibited, were more remarkable for quality than size, and were as a rule highly creditable to the growers. For the best three bunches of Black Hamburgs Mr. Coleman, gardener to Earl Somers, was placed first with examples quite worthy of himself. The bunches were of good size and handsome shape, the berries being fine and as even as if cast in a mould, with colour and bloom perfect. Mr. Wallis, gardener to A. Mundy, Esq., Shipley Hall, Derby, was second with very nice bunches; Mr. Bannerman being third on the list with larger bunches and berries, but the latter being rubbed in transit detracted from the appearance of otherwise fine Grapes. For the best three bunches of any other variety of black Grapes Mr. Coleman had the first place with Black Prince, the bunches being a foot in length, and the berries perfectly regular and as black as jet. Mr. Wallis was second with excellently finished Black Frontignan; Mr. Evans, gardener to C. N. Newdegate, Esq., M.P., Arley, Nuneaton, being third with very good Black Prince. For the best three bunches of Muscats Mr. Bannerman was first with bunches heavy, full, regular, and finely finished; Mr. Fleming, gardener, Sandhays, Liverpool, having the second place. For any other variety of white Grapes Mr. Bannerman was first with exceedingly fine Foster's White Seedling. Mr. Coleman second with capital White Frontignan, Mr. Oushon being third with very large but very much polished Buckland Sweetwaters. For a collection of six bunches Mr. Bannerman had the first place with Madresfield Court, Black Prince, Black Hamburg, Foster's White Seedling, Muscat of Alexandria, and Buckland Sweetwater. These were all good and set up in excellent order; so also was the second-prize collection from Mr. Coleman.

For six Peaches Mr. Coleman had again the first place with very fine Grosse Mignonne, Mr. Jackson, Tixall Hall, Stafford, being second with excellent Early Yorks, and Mr. Barnwell third with fruit large but pale of Noblesse. For Nectarines Mr. Parks, gardener to J. Marriott, Esq., had the first place with Elruge, Mr. Grant being second, and Mr. Bannerman third. The whole of the dishes contained good and well-coloured fruit.

For the best dish of Black Cherries Mr. Miles had the first place with Black Eagle, extra fine; Mr. Maher, Stoke, being second; and Mr. Clarke, Studley Royal, third. For Whites Mr. Cox, Madresfield, was first with Elton, Mr. Miles being second with White Heart, and Mr. Maher third.

Strawberries, of which were seventy dishes, of twenty-five fruits each, were, perhaps, the best feature of this section. For the best dish of the British Queen or Dr. Hogg type the first award went to Mr. James, Kenilworth, for a grand dish of Dr. Hogg, Mr. Cox and Mr. Coleman being second and third respectively with excellent dishes of the same variety. In the any other

variety class Mr. James was first with immense fruit of Oscar. Mr. Winston, Kenilworth, being second, and Mr. Taylor, Malpas, Cheshire, third, for remarkably fine fruit of Sir J. Paxton. Mr. Turner, Slough, was deservedly awarded an extra prize for thirty-six varieties. Messrs. James Veitch & Sons also exhibited a collection, amongst which were James Veitch very large, Biotom Pine, and other popular sorts. This was a very fine collection. An extra award was also made to Mr. Baker, gardener to G. Moore, Esq., Appleby Hall, for plants in pots bearing a good crop of ripe fruit.

Malons. Of these twenty-five good fruits were exhibited. For the best Green-fleshed variety Mr. Coleman had the first place with a fine and richly-flavoured fruit of Eastnor Castle; Mr. Tudgey, gardener, Kenwick, being second with a "seedling;" and Mr. Finlay, gardener to Col. North, Bamby, third with Gilbert's Green-flesh. For the best Scarlet-flesh Mr. Maher, Stoke Court, Slough, had the first award with a beautiful unnamed oval-shaped fruit; Mr. Brown, gardener to Earl Howe, being second; and Mr. Coleman third, both with Read's Scarlet-flesh.

We now come to the last and greatest class of this section of the Exhibition—viz., the collection of eight dishes of fruit, for which £10, £7, and £5 were offered, with the 25-guinea silver challenge cup to the winner of the first prize. Here Mr. Coleman reaped the reward of his skill, and being the second time of securing the first honours, the cup became his own property. His collection embraced a nice Pine, splendid Black Hamburg and good Muscat Grapes, Peaches, Nectarines, Figs, a fine Eastnor Castle Melon, and superior President Strawberries. Mr. Clarke, Studley Royal, was second; and Mr. Bannerman third with admirable collections of nearly the same kinds of fruits. Two others competed, and the whole of the collections were highly creditable contributions.

#### VEGETABLES.

Last but not least in importance we come to this section, and nowhere in the Exhibition were more creditable examples of culture to be seen. For the prize of £5, and the twenty-five-guinea challenge cup added, the best ten dishes were from Mr. Miles, gardener to Lord Carrington. The trophy now becomes Mr. Miles's own property. The collection comprised James's Prolific Peas, Canadian Wonder Beans, Turnips, Carrots, Onions, Tomatoes, Cauliflowers, Asparagus, Globe Artichokes, and Potatoes. There was not a failing dish in the collection, each being nearly perfect of its kind. Mr. Holder, Prestbury, was second—a collection of considerable excellence; third honours going to Mr. Turk, Cheltenham. The roots in this exhibit were especially very superior. For the best eight dishes Mr. Arkell, Cheltenham, had the first place, Mr. Bloxham, gardener to Sir P. Duncan, Bart., being placed second, and Mr. Richardson third with superior collections of the same sorts as in the preceding class. For the best three dishes of Kidney Potatoes Mr. Miles was first with Early Rose, Mona's Pride, and Milky White, Mr. Smith being second with Extra Early Vermont, Lapstone, and Veitch's Ashleaf, Mr. Taylor having the third place. For Round sorts Mr. Richardson, Boston, had the first award with Early King, "Paxton's," and Carter's Main Crop; Mr. Taylor being second with Early Rose, Rector of Woodstock, and Main Crop; Rev. Mr. Bell, Bampton, having the third place. For the best single dish of Kidneys Mr. Richardson won with Mona's Pride, Mr. Bates being second with Myatt's Prolific, and Mr. Taylor third—Rivers' Royal Ashleaf; the awards for the best dish of round sorts going first to Mr. Brown, Gosport, Hull, with Rector of Woodstock; second to Mr. Gullich, Dosthill, with Chatterton's Prolific; and third Mr. Madely, Handsworth, with Rector of Woodstock. In these classes ninety dishes were exhibited of fair average quality, Rector of Woodstock making the most handsome dish.

Peas were remarkably good. For the best three dishes Mr. Richardson won with Omega, G. F. Wilson, and James's Prolific; Mr. Cox, Madresfield, being placed second, and Mr. Arkell third. For the best single dish Mr. Cox won with the Duchess of Edinburgh, Mr. Arkell being placed second, and Mr. Smith, Cheltenham, third. The prizes offered by Messrs. Hurst and Sons for Mr. Laxton's Peas fell first to Mr. Richardson, second to Mr. Miles, and third to Mr. Cox. These were very fine, the best being Omega, Popular, Filbasket, Superlative, and Williams I. Prizes were also given for fifty pods each of Unique to Mr. Miles, Dr. Hogg to Mr. Bailey, and Supplanter to Mr. Miles. In the Pea classes Dr. Hogg, Connoisseur, Carter's Commander-in-chief, James's Prolific, and Omega showed to advantage.

Of the remainder of the vegetables we can only say that Onions were immense and clean bulbs, White Tripoli being in every instance to the front, the awards going to Messrs. Miles, Cox, and Turk. Cucumbers, of which twenty-five brace were exhibited, were noticeable for quality rather than size. Tender and True distanced all competitors, Mr. Cusson having the first place with handsome medium-sized fruit, Mr. Maher being placed second, and Mr. Holder third. In Dwarf Kidney Beans Canadian Wonder was the best of all the varieties; Mr. Bloxham was placed first, and Mr. Cusson second. Oakley was, for

the 1st of July, good, Messrs. Turk, Miles, and Holder standing in the order named. Carrots were bright and clean, Nutting's Nantes Horn from Mr. Miles being especially worthy of mention. Turnips, Lettuces, and Cabbages were generally too large, the awards falling to the smallest specimens. Cauliflowers were mostly coarse, yet some handsome heads were staged, especially by Mr. Miles. Broad Beans were good, Seville Longpod from Mr. Cox being the best, followed by Selected Longpod from Mr. Miles. Baskets of salads were admirably exhibited, Mr. Holder being placed first for a basket embracing almost everything in the salad world. Asparagus was large, Mushrooms poor, and Tomatoes splendid, Messrs. Miles, Coleman, and Cox standing in the order named. A dish of Carter's Green Gage was conspicuous by its excellence: it is a distinct and fine variety. The remainder of the awards will be found in our advertising columns.

The implements and appliances were numerous and excellent. We have only space to note that silver medals were awarded to S. Deards, Harlow, Essex, for improvement in coil boiler; Cowan Patent (Limited) Company, for improvement in limekiln boilers; G. Green, Birmingham, for rusticated garden furniture; J. Unite, London, for square tent without centre pole. Bronze Medals:—G. H. Harris, Birmingham, for three-wheel hose collector; Kneebone & Timmis, Birmingham, for garden plough; P. J. Perry, Banbury, for improved machinery for greenhouse ventilation; N. Voise, Horley, Surrey, for three-light Cucumber frames; W. Barrow & Sons, Nottingham, for rusticated garden furniture; W. Jones, Stourbridge, for improved joint for hot-water pipes; J. Watson, St. Alban's, for horticultural stoves; C. Yeats, Mortlake, Surrey, for garden labels. Highly commended:—T. G. Messenger, Loughborough, for plant-protector, with the improvement recommended; J. Clarke, Stourbridge, for plant-protector; J. Crowley & Co., Sheffield, for improvements in the gold-medal lawn-mowers; W. J. Epps, Lewisham, Kent, for sample of peat.

Yet although the Exhibition was so good in extent and quality, and the arrangements were so complete and satisfactory, another prime element was necessary to ensure success. Of this we regret to say that on Thursday, Friday, and Saturday thunder and rain were prevalent, and it was not until Monday, the last day of the Exhibition, that anything like flower-show weather set in. We are much afraid it came too late to make the success commensurate with the preparations and objects of this great horticultural gathering of which the midland counties have just reason to be proud.

## ROYAL HORTICULTURAL SOCIETY.

JULY 7TH.

THIS being designated the Cut Rose Show, we place the Roses first in our report, but the display was a very poor one, many of the classes being empty. The principal exhibitors have done so much and done so well that they can afford to rest on their laurels; the transitional state of the Society, too, is such that full, free, and hearty exhibiting is out of the question: hence the poor response to the prizes which are offered by the Society. Mr. Prince brought some grand Roses, and just saved the name of the Show. The trade fairly triumphed over the Society; for the competition for the prizes offered by Messrs. Carter & Co., Sutton & Sons, and Hurst & Sons were the great feature of the Exhibition.

In the class for seventy-two single blooms (nurserymen), Messrs. Mitchell & Sons, Piltown Nurseries, Uckfield, had no rivals. The first prize was awarded. The blooms were small, and none of them call for special note. For forty-eight Roses, three blooms of each (nurserymen), Mr. Prince was placed first for admirable blooms in triplets. Mr. Fraser, Lea Bridge Nursery, Leyton, also exhibited in triplets, but the blooms were too much expanded. He had an extra prize. In the class for twenty-four Hybrid Perpetuals only (nurserymen), Mr. Prince exhibited a collection of fine quality.

For forty-eight single blooms (amateurs), T. Laxton, Esq., Stamford, was first with very charming blooms, not large, but of great excellence, Louis XIV. being the richest Rose we have seen this year; Marie Remy, Beauty of Waltham, Annie Laxton, Exposition de Brise, Alfred Colomb, Maréchal Niel, and Miss Ingram were all in very fine condition; Mr. Chard, gardener to Sir F. Bathurst, Clarendon Park, Salisbury, being placed second.

For twenty-four single blooms (amateurs), T. Laxton, Esq., Stamford, again had the first award with a box of beautiful blooms, fresh, clear, and bright. Felix Genero, Marie Van Houtte, Mdle. Marie Cointet, Emile Hausburg, La Ville de St. Denis, Marie Baumann, and Xavier Olibo comprised the best blooms. Mr. Chard being placed second with very nice but irregular-sized blooms.

For twelve single blooms (amateurs), Mr. Bidout, gardener to W. S. Brown, Esq., Woodhatch, Reading, was first with a highly meritorious collection. Sénateur Vaisse, Comtesse d'Oxford, Duc de Rohan, and Annie Wood were exceptionally rich; Queen Victoria, La France, and Mdle. Thérèse Levet being good amongst the light colours. Mr. Chard had nice boxes and the

second award; Mr. Tranter, Upper Assington, Henley-on-Thames, being placed third.

For twelve Tea-scented Roses (nurserymen), Mr. Prince was alone, and had the first prize. He exhibited lovely blooms of Catherine Mermet, Souvenir de Paul Neron, Marie Van Houtte, Belle Lyonnaise, Perle de Lyon, &c.

For twelve Tea-scented Roses (amateurs), T. Laxton, Esq., had the first prize with a collection, but the blooms had been injured by the weather. Perle de Lyon was very rich; America, Niphotos, Marie Van Houtte, and Devonians were the best.

In the class for twelve Roses distinct (open), Mr. Tranter had one of the best blooms of La France ever exhibited, otherwise the collection was not noteworthy: it had the first award. For twelve blooms of Paul Neron, Mr. Prince was first with large and well-coloured blooms; Messrs. Mitchell & Sons, Piltown, being second with blooms a little more expanded. This huge Rose shows to advantage in masses. For twelve blooms of Mme. La Baronne de Rothschild Mr. Prince was without a rival with splendid blooms; indeed no finer have been this year exhibited; he had the first award. For twelve blooms of Maréchal Niel Mr. Laxton exhibited blooms very rich in colour, but not of high quality, having received injury by wet; he had the first award. For twelve blooms of Marie Baumann.—This fine Rose was grandly set up by Mr. Prince, the best bloom in the box being equal to the champion bloom at Birmingham of Sénateur Vaisse; he was the only exhibitor, and had the first award.

For one basket of 2 feet in diameter, filled with cut blooms and Rose foliage, Mr. Chard had a very good and well-arranged basket of fresh blooms and good foliage, to which the first prize was awarded.

Single Rose, any kind, in glass stand, Mr. Prince was first with a beautiful Marie Baumann, Mr. Chard being second with a nice La France.

### PRIZES OFFERED BY MESSRS. JAMES CARTER & CO., HIGH HOLBORN.

THE greatest prize of the year, the fifty-guinea "Carter" cup, with £10 added for the gardener, with £7, £5, and £3 as the minor awards, was competed for on this occasion. Formerly this trophy had to be won three times to secure permanent possession, but now the Holborn firm, with a liberality as great as their enterprise, surrender it to the employer of the gardener winning it the first time. For this great prize there were nine competitors. Finer vegetables have seldom been seen. The Judges, Mr. Barr, Mr. Douglas, and Mr. Woodbridge, took infinite pains, and were long in deciding, and eventually awarded the splendid prize to the Most Noble the Marquis of Exeter, and Mr. Gilbert, the gardener, received the congratulations of his friends.

Mr. Gilbert's collection was exceedingly fine, and was beautifully arranged. Peas, Onions, Beans, Turnips, Carrots, Lettuces, Potatoes, Cauliflowers, and Globe Artichokes were splendid; Melons, Cucumbers, Celery, Mushrooms, Asparagus, and Parsnips being very good. The second prize was awarded to Mr. Arkell, gardener to A. J. Skinner, Esq., Swindon Road, Cheltenham, for a really grand display. It was so nearly equal to the Barghley collection that it was only by carefully adding up the points of merit of each dish that its true place was found. The third prize went to Mr. Pragnell, gardener to G. D. W. Digby, Esq., Sherborne Castle, Dorset, for a great and good collection, difficult to find fault with except on the general ground of a lack of finish and refinement which pervaded the others. The fourth prize was awarded to Mr. Osman, gardener, the Metropolitan School, Sutton, but certainly not because it was the best, but because it was in strict confirmation with the conditions. It appears that in previous years two sorts of Melons were permitted; but this year those who had more than Little Heath committed a fatal mistake. Messrs. Carter would do well to exclude Melons altogether from a collection of vegetables. Their production is an insuperable barrier to many really good vegetable growers competing. But for this mishap the awards must have been different, for Mr. Lumsden and Mr. Cox—previous holders of the cup—both had collections much superior to that of Mr. Osman. For an innocent error a penalty is paid by some of those who unfortunately committed it. Mr. Chard and Mr. Cross also had collections of great value.

For the prizes offered for the best six dishes of Peas, Mr. Cross, gardener to G. B. Lousada, Esq., Peak House, Sidmouth, had the first award, Mr. Pragnell being second. The principal sorts were James's Prolific, Commander-in-Chief, G. F. Wilson, and Hundredfold, and splendidly were they exhibited.

Messrs. SUTTON & SONS offered prizes for six dishes of Peas, of which finer examples were perhaps never exhibited than those of Mr. Pragnell and Mr. Elliott, who were first and second respectively. The principal varieties were Duchess of Edinburgh, Duke of Edinburgh, Giant Emerald, and Best of All.

Messrs. HURST & SON also offered liberal prizes for Mr. Laxton's new Peas. These were exhibited as growing on the haulm—that is, the plants were brought. They were a distinct feature, but time only permits us to say that the prizewinners were Mr.

Cross, Mr. Miles, Mr. Chard, and Mr. Osman; and the sorts William I., Unique, Dr. Hogg, Supplanter, Omega, and Fillbasket. This firm also offered prizes for the best six dishes of Mr. Laxton's Peas, which were won by Mr. Miles, Mr. Cross, Mr. Smith, seedsmen, Romford, and Mr. Cox with collections of great excellence.

We may say generally that the vegetables which competed in the several classes were in the highest degree creditable to the raisers, vendors, and growers; indeed, but for them the Show would have been a complete failure, but with them it was highly interesting and instructive.

**FRUIT COMMITTEE.**—Henry Webb, Esq., in the chair. Mr. William Paul of Waltham Cross sent a seedling Strawberry called Waltham Seedling; a large bright-coloured fruit, and of a conical shape, inclining to cockscomb. The flesh is very firm, like *La Constante*, and having been grown in the garden at Chiswick Mr. Barron reported that it possesses very hardy habit, and is an abundant bearer. It was awarded a first-class certificate. Mr. Miles of the Gardens, Wycombe Abbey, brought a dish of Early Beatrice Peach ripened against an open wall. The fruit, though not so large nor so highly coloured as when grown under glass, was quite ripe, and considering that these were gathered on the 7th of July it is perhaps the earliest Peach from an open wall ever grown in England. A vote of thanks was awarded to Mr. Miles. He also exhibited a dish of the Tomato-shaped Capsicum, which in shape is similar to a Tomato, but much darker in colour. From the garden of the Society Mr. Barron exhibited the Early Orleans Gooseberry, which was pronounced to be the best early Gooseberry. It was awarded a first-class certificate. Mr. Mills of Chiswick exhibited Monarch, a variety grown in preference to any other by the London market gardeners because of its great fertility, large size, and its freedom from the attacks of birds. Mr. Mills also sent fruit of two varieties of Currants, and received a vote of thanks. Mr. J. Hatton, 98, Goswell Road, sent fruit of Allen's Golden Gem Melon. Mr. W. Gallot, Bradford Gardens, Dorchester, sent a seedling Melon called Princess Alexandra; Mr. James Groom, Henham Hall, Wangford, also sent a seedling Melon, but none of these were of sufficient merit to obtain a certificate.

Messrs. Carter & Co., Holborn, sent fruit of Marquis of Lorne Cucumber, exhibiting a remarkable roughness of surface set with spines. These were only found on one plant, which was in perfect health. Mr. J. McLellan, The Gardens, Grove House, Tottenham, sent a seedling Cucumber of handsome shape, but not differing from others in cultivation. Mr. Sage of Ashridge Gardens brought a brace of fine fruit of Tender and True Cucumber. Mr. Barron exhibited plants of the Seville Long Pod Beans, laden with long-podded fruit. Its great recommendation is its earliness and prolific bearing. He also showed bunches of Early White Naples, New Queen, Neapolitan, Markajole, and Nocera Onions. Messrs. Carter & Co. exhibited the American Gathering Lettuce which has originated in Germany, raised by Mr. Heinemann of Erfurt, a curled brown semi-cabbage variety, very crisp and brittle.

Mr. Richard Dean of Ealing sent specimens of Early Snowball Cauliflower, very similar to Early Erfurt, which was represented to have been sown on the 3rd of March. It was decided that it be tried at Chiswick, and that in the meantime Mr. Barron be requested to investigate the conditions under which the plants were grown.

**FLORAL COMMITTEE.**—Dr. Denny in the chair. Mr. Bull exhibited a collection of *Lilium* in bloom, *Phalenopsis erubescens*, and *Hydrocotyle nitidula*. Mr. Bateman exhibited blooms of *Lilium Bloomerianum oscillatum*, and had a vote of thanks awarded. Double *Clarkia elegans*, Salmon Queen, and Purple King, sent by Mr. Hardy, Stour Valley Nurseries, Bures, Essex, had first-class certificates awarded. Mr. Croucher, Sudbury House, had a vote of thanks for *Masdevallia Harryana* with thirteen fine blooms; as also had Mr. Douglas, gardener to F. Whitbourn, Esq., for magnificent blooms of *Cattleya gigas*. First-class certificates were awarded to Messrs. J. & C. Lee, Hammersmith, for splendid seedling *Begonias* Coltoni and Rodwelli, with large blooms of rich orange scarlet. Mr. George sent Zonal *Pelargoniums* Sultan of Zanzibar and Criterion. Mr. R. T. Vetch, Exeter, had a vote of thanks awarded for well-grown plants of *Nertera depressa*. A first-class certificate was awarded to Messrs. T. Cripps & Son, Tunbridge Wells, for *Clematis Fairy Queen*, a very large bluish variety. Mr. Laxton sent double *Pelargoniums*; and Mr. Dean, Canterbury Bells and Stocks of good quality.

### THE ENOTHERAS.

The Evening Primroses form a genus of very beautiful plants for the decoration of our flower beds and borders. A few of them are of trailing habit and are half-hardy. These, of which *E. Drummondii* may be mentioned, are suitable for small beds and for hanging over the edges of rockwork and rustic baskets. The hardy herbaceous section are also of dwarf habit

and are interesting and attractive border and rock plants. (*E. caespitosa*, *E. fruticosa*, *E. speciosa*, and others are all adaptable to this mode of culture.)

The hardy biennials, of which we give a typical representation, are, however, the most showy, their tall spikes of soft primrose-coloured flowers which open in the evening being very beautiful; the foliage of these plants is also clean and bright, and the plant's habit is stately and agreeable. For planting in Rhododendron beds and for imparting a cheering touch of colours to shrubberies in the evening few plants are better suited than are these stately *Enotheras*. Neither have

Fig. 4.—*Enothera*.

we any plants of more easy culture. In many gardens when once established they will take care of themselves, yet they seldom increase so fast as to be an incumbrance. They flourish in the full sun and also under trees better than do most tall-growing plants. In wet weather they seldom are injured, while on hot dry banks they will remain fresh after most plants are withered by drought. At this period of the year many gardens are made attractive by their towering spikes, and in the twilight especially no plants are more striking. For Mr. Taylor's ideal semi-natural garden these plants are amongst the best can be used. They are not to be used as cut blooms for the exhibition in the daytime, but it is for the decoration of the border and shrubbery at eventide that these good old plants are worthy of extended culture.

They are increased by root-division in the autumn and by seed. Seed sown at the present time in the open border, and the seedlings, when large enough, transplanted will grow into

fine blooming plants for the following season. It is a little singular that these gay, distinct, and useful plants are not more generally employed. They are certainly worthy of culture, and when seen in association with the sombre foliage of shrubs in the evening are always admired.

### STRAWBERRIES.

Now the Strawberry season is in full swing I think the subject might with advantage be again ventilated, as it is not only the fruit-bearing period, but also the time for making preparations for another season. The readers of the Journal are aware that this subject cropped-up some months ago, and was pretty well discussed at the time, and the only apology I have to make in recurring to the subject again is merely a reminder to refresh the memory, as it often happens that when a subject of this kind is discussed out of the season of preparation it is apt to be forgotten, and now another season's experience will have been gained as to the merits of different varieties, for what is eulogised one season is decried another.

The nature of the soil is one important element in Strawberry culture, water another; a similar soil may exist in widely-separated localities, and yet have very different results with the same varieties. The difference between a dry and a wet locality will effect this. I am located on a poor hungry soil with a gravelly subsoil, but in ordinary seasons most kinds of Strawberries do pretty well, but many sorts in dry seasons differ much in quality. On this soil I find it necessary to make fresh plantations about every third year.

British Queen still maintains its high reputation, and in ordinary seasons does well, but it is astonishing what a difference a wet and a dry season makes in the quality of the different kinds of fruit, such as Sir Charles Napier, Oscar, and Sir Joseph Paxton. I find that if the fruit-swelling period is dry the quality of the fruit deteriorates considerably, while British Queen and Dr. Hogg seem to retain their high crisp flavour. President seems to be in its proper element, and stands the drought better than most kinds. I must not forget the old Keens' Seedling. I have heard of other varieties which are considered better for preserving purposes, but I very much question if there is a better general-purpose Strawberry than the veteran Keens' Seedling, and I am of opinion that the name will be a household word for some years to come.

Strong runners taken now and planted in well-prepared ground ought to bear fruit next season; if deferred much later they will not do much good before the second year.—G. R. ALLIS.

### DEUTZIA ORENATA FLORE-PLENO.

I THINK the above-named plant is not so popular as it might be, considering the usefulness and beauty of the flowers at this season and likewise when forced. I propagated a quantity some years ago and planted them out in the shrubberies and borders here, and I have been rewarded each year with a beautiful display of white flowers; for grown underneath the shade of trees or in shady shrubberies—where it grows and blooms as well as in the sun—the flowers are almost pure white, but in the sun the flowers will be slightly tinted with rose.

Anyone having to supply a quantity of white flowers at this season for decorating vases, making bouquets, or the more solemn ceremony of making a wreath of flowers to place on the grave of a friend or relative, will find this plant of great assistance.—J. A., *Hill Grove*.

### FURTHER REMARKS ON LATE PEAS.

THE remarks of "A NORTHERN GARDENER" on late Peas, page 486, vol. xviii., are well worth studying, but I fear if he travelled southward he would find great difficulties of having them so late as he speaks of, and it may be some consolation to him to know that while he can put a dish of green Peas on the table gathered from the open ground a few days before ice was strong enough for skating on, and keep them for use till that day, a feat was accomplished which has few if any parallels in the south of England; yet I fully believe every word he says on the matter, and have a perfect recollection myself of seeing a dish of Peas at a horticultural show in the north about the middle of November that were said to be the produce of seed ripened that year and sown again that same year, in other words two crops in one year. I do not remember if it was from the same plot of ground, but it easily could have been;

certain it was they were there, and in fairly good order. The variety I think was an early white one, possibly the Early May or Charlton, the parents of most of our early Peas. The season was, if I remember right, 1828; certainly not 1826, which was the hottest and driest summer I ever remember; in which two crops of ripened Barley from the same field were not uncommon even in cold out-of-the-way places, and the second crop ripened as well as the first.

But to the matter of late Peas. I fear we sojourners of the sunny south have no chance of expecting them so late. Artificial watering may possibly do something for them, but even that will not always scare away mildew—a fell enemy to the Pea late in the season; but the mode recommended by our correspondent is the only way to expect a good result; and although I do not remember ever to have witnessed the Peas sown in sunk trenches, I have no doubt the plan is a good one where there is depth of really good soil, but a plan adopted by an old gardener many years before the first Reform Bill became law deserves to be mentioned here; for, like "A NORTHERN GARDENER," he sowed the rows wide apart, but instead of making one drill for the seed he made two about a foot or 15 inches apart, and in dry weather placed a ridge of dung along the space between them before they were up, supplying them with short sticks at first and long sticks afterwards, adding more dung at the sides in the way of mulchings, and watered the whole when required. The advantage of this plan will be apparent to everyone: the roots of the crop being divided occupied more ground, and consequently benefited accordingly, as I do not remember of ever seeing finer crops of Peas, which were of good quality. This plan I have frequently followed; but when a dry hot summer sets in, and the impossibility of supplying them with water follows as a matter of course, all hope for a crop of late Peas is out of the question; but the effort to obtain them is still worth trying, and like many others I have to thank your correspondent for calling attention to it.

Possibly many places in the cool and moist western and northern counties have a better chance than we have in Kent in maintaining a healthy growing vegetation during the dry hot period of the dog days, and Peas as well as Lettuce and other things benefit accordingly; but with us when such dry seasons as 1868 and 1870 occur, when rain in sufficient quantity to support even the Scarlet Runner was not forthcoming, and a short supply the result, it is hopeless to expect Peas to be fruitful, for in practice it is found better to depend on Scarlet Runner and French Beans in the latter part of the summer than on Peas, and cropping is done with that object in view, and although it is but seldom that Scarlet Runners can be served-up fresh to a party of skaters, it is certain they can be retained to a later date than even the Peas.

Again thanking your correspondent for his useful paper on the subject, and agreeing with him on the merits of the variety *Ne Plus Ultra* as a general cropper (for I have not used it very late), I hope his practical remarks will draw out those of others on this useful and interesting subject.—J. ROBSON.

### BELVOIR CASTLE.—No. 2.

#### THE SEAT OF THE DUKE OF RUTLAND.

ALTHOUGH I regard the spring bedding at Belvoir as its most noticeable feature, I do not at all mean to imply that it is followed out to the exclusion of other work. Anyone who knows Mr. Ingram need not be told that whatever department of gardening you look at under his management is sure to be well done, and go where you will you will find the evidences of a master's hand. The Castle stands, as will be seen from the woodcut, on an eminence, and around it the various terraces are arranged with the same object as the gardening on the slopes—viz., to give a cheerful appearance in the earlier months of the year; and the various combinations afforded by the liberal use of *Aubrietias*, *Oxlips*, *Myosotis*, *Sedums*, *Violas*, *Epimediums* (of which latter Mr. Ingram speaks in high terms, and deservedly so) were even, although past their prime, very charming.

The kitchen and fruit gardens, which are about three acres in extent, were, as might be supposed, in a high state of cultivation, and there was, as there is everywhere, something to be learned. Noticing some fine beds of *Frogmore Late Pine Strawberry*, and seeing that the plants were not separate, as is usually the case in good gardens, I was told that it is the only way in which Mr. Ingram finds that he succeeds. Others who find it difficult to grow Strawberries may, perhaps, succeed in

the same way: the exception proves the rule, and so with that which prescribes young plants. Trollope's Victoria bears as well if not better on three and four-year-old plants than on young ones. The walks in the kitchen garden were edged with slate about 1 inch thick on the edge, and while looking very neat afforded no harbour for slugs. Mr. Ingram had also a capital plan for filling up the spaces on walls with Pear trees when trees had become worn out. He had raised a number of seedling Pears, and when these had been tried and found worthless they were planted against the wall in the place where the old trees were, and then grafted right up, so that in a very short time a tree was formed and then the old one was taken away. I may here mention that I saw near here the other day some Apple trees grafted in a similar way all over instead of, as is the usual plan of being cut down and the stump grafted. As the soil is heavy some vegetables require to be grown in a peculiar way. The Potatoes were planted on ridges in single rows—a modification of the plan so often adopted in the wet climate of Ireland and called the lazy-bed system; but

these are not beds, but simply ridges. In the same way Asparagus was grown in ridges, and thus an easy method of forcing in the open ground can be adopted by filling up the spaces between with fermenting material. I recollect seeing something of the same kind adopted at Montrouge near Paris. The houses and vineries were all in excellent order. Plants do not, however, form a feature in this establishment, those being cultivated only which are adapted for decorative purposes, during which they undergo such a system of ill-treatment as requires all the skill of the gardener to resuscitate them.

In the reserve garden were to be found many of the once-decided herbaceous plants, which are here fostered and petted. And here let me subjoin a list of some of those which I noted, and which Mr. Ingram spoke highly of. Some of them were in bloom, others had passed, while some had yet to declare their beauties. *Erodium manescavi*, *Schreberiskia podolica* (very early, white Arabis-like flower), *Potentilla Donbri* (white), *Arum variegatum*, *Geranium subcaulescens* (deep rosy crimson,

Fig. 5.—BALVOIR CASTLE.

dark centre), *Cerastium arvense*, *Veronica pectinata* (very dwarf), *Iberis superba*, *Iberis jucunda* (very lovely), *Campanula soldanella flore pleno*, *Lithospermum Gastoni*, *Spiraea filipendula*, *Alyssum Wiesbeckii*, *Alyssum argenteum*, *Linaria alpina* (Alpine Toadflax, very pretty), *Rhododendron praeox*, *Erigeron grandiflorum*, *Viola striata*, *Epimedium pinnatum elegans*, *E. rubrum*, *E. striatum*, *Dodecatheon giganteum*, *Doronicum caucasicum*, *Polygala chamaebuxus* (pale lemon and bright yellow, very fragrant), *Gentiana verna* and *acaulis*, besides many others well known and extensively used in most gardens where herbaceous plants are cultivated.

Mr. Ingram spent some weeks last year in Norway, of which he gave an interesting account in a contemporary. In a small nook he has brought together some of the *spolia optima* of his journey, including *Sedum evenese*, *Salix polaris* (the smallest tree perhaps known), *Betula nana*, *Thalictrum alpinum*, *Arenaria prostrata*, *Viola bicolor*, *Saxifraga corymbosa*, &c.

I have given but a very imperfect idea of the peculiar characteristics of this princely residence. I have not dwelt on its architecture or its *entourage*, except only as it bore upon horticulture; and have but to add that from Mr. Ingram I re-

ceived the utmost courtesy and kindness, and to Mrs. Ingram I am indebted for the clever sketch of the garden on the slopes. —D., *Deat.*

#### THE PRUNING OF PEAR TREES.

I wish to enter my protest against the barbarous and unnatural system which is now so prevalent of pruning bush Pear trees with the shears in the same manner as is practised with Yews and Portugal Laurels. This practice, besides being most injurious, as I cannot but think, to the health of the tree, exposes only a small surface to the influence of the sun and air, and much diminishes the area from which a crop may be expected. In my opinion, as the result of several years' experience, a thinning-out of the centre of the tree so as to admit plenty of sun from above, combined with a judicious and moderate shortening-in of the side shoots, is the proper mode of culture.

A mulching or top-dressing in the spring, and, if thought necessary, an occasional root-pruning, may also be resorted to; but the grand point is allowing the sun to shine into the

interior of the tree and the air to circulate freely round the branches.—J. C. BARNHAM.

### SUTTON'S RED-SKINNED FLOURBALL POTATO.

In answer to "W. H. A.," who asks what is the parentage of the Red-skinned Flourball Potato, I believe it to be of American origin. In support of my opinion I may state that a friend of mine had a few Potatoes sent from America four years ago before the Flourball was sent out by Suttons; some he gave to a gardener in the neighbourhood, and the remainder he kept growing by the side of the Flourball, and they each fail to discover any difference, nor can I who have noticed them the past two years. I may add that my friend having received his from America without name, called his the Tuscarora.—W. BARR.

### PEACH BLISTER.

We have recently received from one of our correspondents (Mrs. Carlisle), some specimens of Peach blister with the fungus

here and there be detected on the red blister, and this bloom when magnified one thousand diameters linear is seen as shown at a. It is excessively minute as compared with the thickness of the leaf and its component cells; the latter magnified to the same scale are seen at c. The fungus consists of a stratum of fine threads, which throw-up a series of small flask-like bodies (asci) filled with spores, the flasks being mixed with necklace-like growths b, which are clearly a second form of fruit. Each ascus, or flask, contains eight-spores, which at certain moments open at the top, as at a, and discharge their spores (which are analogous with seeds), into the air to continue the existence of the species elsewhere.—W. G. SMITH.

### SUMMER PRUNING.—No. 1.

THE object of all pruning is the origination of new parts, diverting the sap from an over-vigorous to an enfeebled part, and the reduction of barren and the production of fruitful wood. By the first we secure the form in part of the present and ultimate specimen; by the second its symmetry; and by the third the highest quality of produce. Fruit-bearing trees naturally have no pruning other than the browning of herbi-

Fig. 3.—PEACH BLISTER WITH ACCOMPANYING FUNGUS (ASCOMYCES DEFORMANS).

(*Ascomyces deformans*) which is said to cause it, in such unusually good condition that we are induced to give an illustration of the latter as seen under the microscope. An editorial opinion has recently been expressed in these columns that the blistering is caused by spring frosts rupturing the sap-vessels, and that the fungus lives upon the extravasated sap. When Mrs. Carlisle's specimens were exhibited before the Scientific Committee of the Royal Horticultural Society, Mr. Smee, who is well acquainted with the disease, expressed his belief that the blistering was caused by an injury inflicted by an aphid, and he has expressed an opinion elsewhere that the fungus is seldom really seen with the blister, but that the aphid is an invariable accompaniment. De Bary, however, and Berkeley say the blister is caused by the fungus, and the former has published a figure of the mycelial threads as seen inside the leaves amongst the cells before the perfect fungus appears upon the surface. However this may be, we must confess that our views range on the side with Mr. Berkeley, and we imagine the reason why the fungus is not invariably seen is simply because in its early condition it is confined to the interior of the lamina of the leaf, and its life may possibly be brief in its perfected state on the exterior. The spawn of the fungus, like the spawn of the Potato disease, is corrosive, and changes the green colouring matter of the cells from the usual healthy hue to a deep blood red.

In the accompanying cut, a shows the Peach blister as commonly seen; when the fungus is present a white bloom may

vorous animals, therefore cultivated and natural trees are not in this respect analogous. Orchard trees are not to be admitted natural, for they at least have a certain amount of time expended upon them in pruning—in giving disposition to the branches, and some occasional after-care in the thinning, otherwise we readily grant orchard trees are the nearest approach to Nature of anything cultivated, and as such are not subject matter for summer pruning. Our remarks, therefore, apply to trees cultivated in gardens as pyramids or bushes trained to walls or espaliers. Limited to space as such trees are, the necessity, if they are to be kept to it in a fruitful state, for pruning arises. It is not in any sense an imitation of nature, but of restraining—causing the trees to conform to the requirements of the cultivator. There is not, perhaps, a more interesting or important operation than summer pruning, forming such a pleasant contrast to winter pruning, which only those having had feet feeling like ice—it may be chilblains—and fingers cold and benumbed, can thoroughly appreciate. I know it will soon be "dog days," when it is hoped any having an hallucination for winter pruning will lose it.

Fruit trees have three descriptions of shoots: leaders, the continuation of stems or branches; side shoots, originated from the branches; and spurs, mainly producing the fruit. We have also laterals, which mean literally any side shoot, but in gardening phraseology laterals are side shoots from growths of the current year. Foreright shoots, which are those proceeding from the front of a branch and at right angles

or nearly so with the wall. Others there may be, but I do not know the term they are recognised by.

Now, fruit trees have two growths, spring and midsummer. The first is the strongest, and in vigorous trees is continued to a period long past midsummer; but upon moderately vigorous trees the first growth is over by the early part or middle of July, and varies somewhat with different trees. Apricots will have the first growth made by the middle of June to its close. Plums follow next, then Pears, and last of all Apples, unless we take cognisance of the Peach and Nectarine, and those of course are next to the Apple in completing the first or spring growths. When the trees are as before stated very vigorous, the spring growth is not complete until a late period, so long-continued is it that there is difficulty in distinguishing the spring from the second growths. The less vigorous the growths the earlier the spring growth is made, and the sooner it is, of course, succeeded by the second or midsummer growth. Between the two is a sort of cessation from growth for a time. The cessation from growth is, though brief, for some purpose which I do not profess to comprehend. It may be the giving of character to the buds (and I could advance much in proof), or as tending to some end in respect of the fruit; certain is it the wood becomes what we term in trees which do not lose their leaves, firm. From the points of such shoots or near them other shoots arise in many cases, not in all, whilst shoots may be originated from other parts which in the first growth have been in a semi-latent state. The shoots so resulting are the second or midsummer growth, and if they proceed from wood of the current year are laterals. The second growth will be continued until a late period, and is not usually productive of bloom buds, seldom I believe in the case of stone fruit, though instances occur of bloom buds being formed upon the second growths of Pears and Apples. The first growths are therefore most momentous; the second are mainly of value in promoting root action, drawing up fresh supplies of sap for the fruit, and elaborating it in a more perfect manner than the leaves of the first growth, whilst they also prevent, by appropriating any excess of nutriment, its being forced into the buds of the first growth, and their premature expansion, as is occasionally the case with Pears, Apples, Cherries, and Plums, the bloom buds expanding in summer, and the hopes of a crop the following year being lessened. Such instances are not uncommon, and those having any experience at all of trees on the dwarfing stocks, cannot but be more or less familiar with two blossomings in a season, frequently a little here and there, but occasionally a full display.

It is not necessary to do more than note the evil calculated to be done by practising summer pruning at an early period of the first growth, or before the leaves intended to be stopped to are full-sized, for if the tree be very vigorous it will only be resultant of two or more shoots from below whence the stopping was done, and the tree is as full of sappy shoots in a year as it was before the stopping. It is only just to state that a very vigorous fruit tree neither by early and severe stopping, or even moderate pinching at a later period is to be brought into a satisfactory fruiting state, it requires pruning at the other end—i.e., the roots, and by reducing the supply of sap inducing a less plentiful amount of fruitless wood or spray.

If we operate upon a very moderate-growing tree very early in the season we liberate the sap, and cause it to be forced into parts expected to form fruit buds, and thus acted on early they may start into growth instead of developing into fruit buds, or should they already be of the latter character we may hasten their development, their maturity being completed at so early a period in summer that they are forced into flower by there not being present other means of appropriating the sap. Early pinching for other important considerations we do not advise, not a few of the many mishaps to fruit trees accruing from want of foliage at an early period, and to lessen it does not appear a satisfactory means of avoiding them. Blistered and crumpled leaves is known to be the result of chill, by continued cold weather; pinching will not give warmth, but expose the parts remaining more fully to the influence of cold, and jeopardise the fruit by its being more fully exposed, the leaves being its natural protection from adverse influences. Early pinching must also limit instead of promote root action, and the growth and the tender fruit be for a time arrested, if indeed it does not cause the crop to be thrown off or become cracked or otherwise deformed.

Though too early pinching be bad, late summer pruning is equally deprecable, for the allowing of long vigorous shoots to be made appropriating the sap, shading the spurs and fruit,

and thereby depriving them of light and air, is a robbery of the fruitfulness in the present as well as for future seasons. The spurs receive very ill-support, and the fruit less, for the parts—i.e., the leaves feeding them—are small from being under the leaves of the shoots, and they imperfectly perform their functions owing to the unfavourable conditions in which they are placed for doing so. Late summer pruning deferred until a late period is also undesirable from the parts requiring to be removed being large, suddenly exposing the fruit and leaves that were overhung by spray to bright and it may be hot sun, and they must have forced into them the sap that was needed for the spray removed, and as there is no part or only lesser foliage to appropriate it, it must create a stagnation at the roots, and cause to be put out speedily a quantity of spray that will be active late in the season. In fact, so complete is the check consequent upon a late and large removal of summer shoots, so paralysed is the root action, that the tree for a long time afterwards remains stationary, making no effort at fresh growth, and when it does it is weakly and late. In no wise can a large development of spray conduce to the size or quality of the crop, and in no wise can it by a large and sudden removal contribute thereto, but must act prejudicially upon the tree's healthfulness and its present and after fruitfulness.—G. ABBEY.

### NEW DISEASE OF POTATOES.

I AM sorry to have to state that it attacks English as well as the Yankee Potatoes. I have Walker's Regent, and especially Flourball (Sutton's), badly attacked. I had it very bad (1874) among Early Rose; about half died off as described in last week's Journal, just as the Potatoes began to form. I have examined several gardens since it was mentioned in the *Journal of Horticulture*, but chiefly do I find it in the American race. One garden nearly all Red-skin Flourball was badly affected.—E. J., Louth.

[More than one correspondent states that Sutton's Flourball is liable to this disease, and each asks, Is one of its parents an American variety?—EDS.]

I HAVE a row or two of Extra Early Vermont (I saved the seed myself last year), and find several roots attacked in the way you describe. None of the English varieties are attacked. My next-door neighbour has also some in the same condition, and the circumstances are precisely my own.—G. C., Croydon.

THE disease is very prevalent here in some cottage allotments known as Clarke's Gardens. In one of them I saw sixteen plants of American Late Rose, and they are all dead, also several plants of Extra Early Vermont; and the other varieties do not look so strong and vigorous as they were in former years, the leaves being very much curled.—W. B., Doncaster.

### CELERY CULTURE.

THERE are few plants which require more care in culture than does Celery. Having experienced some failures and a fair share of success, I can offer a few notes upon its culture. Leicester Red is the sort. Those who require early Celery must sow in heat about the middle of January, prick-out in heat, and harden-off in frames. I sow for the main crop the first week in March, place in a Cucumber house, thence to a vinery, then to a frame to harden for ten or twelve days. The plants are then pricked-out in 5 inches depth of soil (on ashes made hard), well mixed with Mushroom dung or droppings broken up. In this compost the plants are readily moved to the trenches with a good ball.

Stocky plants are also obtained by sowing in a warmer corner early in March, timely thinning, and planting in the trench when large enough. I have noticed Asters, Stocks, Helichrysums, and other plants do equally well sown out in the borders. With the Celery the next thing is the trench.

The soil here is 2 feet deep, and the greater part of it is annually trenched, turning-in to the bottom a foot thick of husky strawy manure from the stable, shrubby refuse, &c. After early Peas, a trench is thrown-out 5 feet wide, 1 foot deep, and plenty of dry short manure is worked in. The plants are placed 1 foot apart each way, water is freely supplied till re-established, when liquid manure is given. Soot is used to prevent fly, and salt to keep-off worms and to give solidity. Blood manure is an excellent stimulant for Celery. Earthing is commenced with the growth, using boards and

handling each plant separately, and keeping the heart up until growth ceases. It is then earthed-up close, and litter is put on in severe frost.

By the above method of culture Celery is obtained from 4 to 6 lbs. weight, and of the best quality. I have not found the earthing to check its growth, in fact if well supplied with liquid it will push the soil down from the sides, for its vitality cannot be overcome.—C. PRINCEP.

### LOBELIA PUMILA MAGNIFICA.

THE merits of this fine Lobelia cannot be too widely known. No one who saw the baskets in the exhibition tent at Regent's Park last week could fail to be struck with its great superiority. It is a robust form of pumila, and in habit perfect. The blooms are large, stout, and intensely blue—Lobelia blue—and the white eye is clear without being obtrusive. There is but little doubt that it is the finest Lobelia yet raised, and cannot fail to be invaluable both for pot culture and garden decoration. I direct attention to it because of its sterling worth, and because I am satisfied that it is one of the few plants that cannot disappoint. It is massively rich and charmingly chaste, decorative qualities which but few plants possess in combination. I advise all my gardening friends to possess this fine Lobelia.—J., Battersea.

### THE POTATO CURL.

THERE can now be no doubt that the new disease affecting the Potato is the recurrence of an old one known to some of us in our young days as "the Curl." This appeared towards the end of the last century, and continued with more or less virulence for the first five-and-twenty or thirty years of the present one. We have a perfect recollection of the dread with which it was regarded, and the disastrous results of its attacks. Volumes were written upon it by the most noted agriculturists and gardeners of the day, from Arthur Young and T. A. Knight downwards, and so serious was it that it engaged the attention of the most eminent scientific and practical men of the period. Its origin and its cure alike baffled the ingenuity of all who turned their attention to it till at last it died out, and for forty or more years it has not been heard of, till two years ago it made its appearance in the new seedling varieties of American Potatoes after they had been grown one season in this country.

This fact singularly corresponds with what we find in some of the early accounts of the disease. Arthur Young says that of Potatoes raised from seed one plant in thirty will be curled, and if propagated will retain this quality; and Dr. Anderson, a great authority of the period, states in the Bath papers that a large field planted with Potatoes the third year from seed had more than half the plants curled, while another field near it planted with sets which never, as far as he knew, were produced from seed, had scarcely one plant curled in the whole field.

There will no doubt be many conjectures as to the origin and cause of this disease, some being the old ones revived; and there will also be as many suggestions for a cure brought forward now as were formerly; but while others may be investigating and some dreaming as to these, our advice is, to be wise in time, and utterly to destroy every variety and every crop in which it has made its appearance; for our readers may rest assured it is a far more serious matter than some of our contemporaries who have treated on the subject seem to think of.

**ONION MAGGOT.**—It may now serve some of your numerous readers to inform them that soot prevents the Onion maggot if perseveringly used till the danger is passed. I believe the fly lays the eggs on the manure near the surface.—C. PRINCEP.

### NOTES AND GLEANINGS.

TO-DAY (THURSDAY) a SPECIAL GENERAL MEETING of the Royal Horticultural Society is to be held, and it is to be hoped that all who look forward to the Society being pulled out of its difficulties will attend and support any motion that may be brought forward to urge the completion of Lord Bury's resignation.

It is proposed to call a MEETING of the leading horticulturists on Wednesday, the 21st of July next, at six o'clock P.M., at the Criterion Hotel, Piccadilly, to consider the best means

of carrying out the pledge to hold an INTERNATIONAL HORTICULTURAL EXHIBITION during the year 1877.

### NOTES ON VILLA AND SUBURBAN GARDENING.

**FLOWER GARDEN AND SHRUBBERY.**—All sorts of bedding plants will have become fairly established by this time, and they must of necessity have considerable attention. The beds must be well hoed and cleaned, and the plants be induced to cover the space desired as soon as possible either by tying them out or neatly pegging them down. These are such as Verbenas of sorts, Nierembergias, Heliotropes, and other dwarf-growing or trailing plants. Then there are many plants which must be staked in time, as Hollyhocks, Dahlias, and Salvias. These are much reduced in beauty if allowed to go too long unsupported; for the wind once blowing them about prevents the plants being put into proper order again. As I have hinted once or twice before, both pegs and stakes should be prepared in times of leisure so that the work may now be done more expeditiously. Dahlias will be the better if a mulching of rotten manure be applied to the roots, so that when water is given the plants will receive extra benefit, and fine flowers is the general reward. Put stakes to Gladiolus, and secure the plants to them by one tie at present, and that must be rather low than otherwise, which allows of a freer growth and the bloom spike to come up without any obstruction.

Roses have been objects of great interest so far, and about here the flowers have been very fine. I hope when it is intended to increase the stock by budding that a selection of those best suited to the soil has been made, because budding should not be delayed any longer if the bark rises freely and the sap is flowing well from where the buds are taken. This should always be noted as important in the success of budding; and again the bud must be nicely and firmly fastened to the place in which it is inserted, and the stock itself be made secure against the wind. It is a practice in some localities to shorten the young shoots of the Briars by more than one-half at the time of budding, but I prefer leaving it the entire height till the bud has taken, because if the weather has been previously dry, or should set in dry immediately after budding, the shortening of the shoot causes a check to the flow of sap, and the bud suffers just at the time it most requires support.

Prick-out Brompton Stocks and Wallflowers into beds of good open soil, and encourage them to advance in growth. Violets that have been divided and planted out will likewise need encouragement, and they must not suffer from the want of water. The better crowns they form the more bloom will they afford when planted in the frame in autumn.

The shrubbery will require looking over—that is, all coarse growths that are rising up to the detriment of the lower growth and the shape of the plant, must be cut out. An unequal growth is particularly objectionable in a young hedge of almost any sort, and often ruins it. Yews and Laurel hedges that are intended to be ornamental and tidy may be now clipped, or rather out, for the knife is better for the purpose than the more ordinary shears; the knife hides the cuts, but the shears cuts the leaves in two, which is very objectionable.

Go over Rhododendrons that have done flowering, and pick off all the seed vessels, which not only makes the plants look neat, but allows the growth a free course, as it starts just at the point where the bloom rests. Look over the shrubbery generally, and see that no choice plant is being overgrown by its coarse-growing neighbour. Have all grass frequently cut and the edgings neatly kept, and walks rolled after rain, which by frequent use and a period of dry weather the surface of them is apt to work up in a rough state and become unpleasant to walk upon. Put in cuttings of Pinks, and layer Carnations and Picotees as soon as their growth is sufficiently advanced.—THOMAS RECORD.

### DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

#### KITCHEN GARDEN.

THERE are two important crops that ought to be attended to this week—late Peas and late Cauliflowers. The gardeners in the north of England and in Scotland have the advantage over the southern growers in respect of these crops. In favourable localities with deep and moderately heavy or heavy soils decent crops may sometimes be produced, but in light and shallow soils it is labour in vain to grow these crops late in the autumn. Mildew and thrips are also very troublesome pests to deal with on the late Pea crops. It is now time to sow the Peas, and the late rains have made the ground in condition to receive the seeds. The ground ought also to have been prepared by being manured and deeply trenched. Were we sowing Peas this week the sorts would be Laxton's Alpha and Fyllbasket: the last-named is not a Marrow Pea but a hardy sort, and is wonderfully prolific. It may be necessary to water this crop after it is up, and they may be syringed with soot water.

Early London, Lanermand's, and Veitch's Autumn Giant are good sorts of Cauliflowers; the late rains afford an excellent opportunity to plant them out. It is sometimes necessary to plant out in dry hot weather, but it is seldom that the crops do so well. Plant Autumn Giant 2 feet, and the other two sorts from 18 to 20 inches apart. The Cauliflower even more than the Pea delights in a very deep rich soil. Cabbages may also be planted out now for autumn and early winter use. Coleworts and Atkins's Matchless are excellent varieties.

We have planted out the main crop of Celery, and those who have not yet done so should seize the present favourable opportunity. The usual method in this neighbourhood is to plant in single rows, and splendid Celery is produced where attention is given to watering; but where quantity is of more importance than quality it is better to plant in wide trenches, say 4 feet wide: this will admit of four rows 1 foot apart. The two outer rows would be 6 inches from the sides, and two rows in the middle a foot between each. Then as to planting in our garden, we dig down very near to the gravel, place in some rotten manure, and 2 or 3 inches of rich mould over this; the plants are then set out with a trowel.

One of the most useful winter crops with us is Brussels Sprouts, and we generally manage to obtain a tolerably good supply. We have found that they succeed very well if sown in deep drills, drawn as for Peas 2 feet apart. A little fine mould is sprinkled over the seeds, and as the plants increase in size the drills are filled in. The plants receive no check in this way, and they make sturdy plants, well furnished to the bottom. Of course they are thinned-out to the usual planting distance in the rows.

Sowings of Endive may be made this month. Fraser's Improved Broad-leaved is one of the best sorts for winter use, and a good stock of the Green Curled sown at the same time will come in earlier. Lettuce must also be sown to keep up a supply of this most wholesome salad. We still hold to Hick's Hardy White Cos as being the best for all purposes; but those who prefer the Cabbage variety cannot do better than sow seeds of "All the Year Round." Admirers of big Lettuce must sow the old Drumhead or Malta.

#### PINEAPPLES.

The large importations of foreign Pines make some difference in the time of ripening-off the fruit, especially for those establishments where the surplus stock of fruit is sent to market. It is no use at all to start early to obtain fruit in by the end of May or the beginning of June, for at that time the market is stocked with fine fruit from St. Michaels. One is not only struck by the fine appearance of the fruit, but they evidently have the best stock of Smooth-leaved Cayenne, and good British gardeners have been sent out to superintend the cultivation of the fruit. About the last week in June the supply ceases, and English-raised fruit may pay for growing all through the remaining summer months. The earliest Queens will now be nearly all out, and it will then be necessary to re-arrange the plants; the succession houses become crowded and the plants which are far advanced in growth may be arranged in the fruiting house, from which the old plants have been removed. There are very few houses now where the old deep tan pits are used, about 18 inches of plunging material (tan is the best), over the hot-water pipes will retain sufficient heat for the roots until it is time to start the plants, when the tan should be sifted if necessary, retaining the rough part only and adding fresh material, the whole to be well mixed-up together. When the Pines are started is the best time to add fresh tan, or it may also be added when the suckers are potted.

**Cucumbers.**—Those who are growing their plants in houses will not require any further information than may be obtained from previous notes under that heading. A few remarks may not be out of place on the culture in frames. It is not absolutely necessary to keep-up bottom heat in the beds, but the largest quantity and the finest Cucumbers we ever cut from frames were grown in this way. A space 1 foot wider and a foot longer than the frame was marked out, a lot of rough faggots were laid down on which to build the manure heap, and the faggots when pressed down by the weight of the manure still sustained the load 18 inches from the ground. The bed is 2 feet 6 inches high at the back, and 2 feet in front. The use of the faggots is to allow the heat from the linings that are applied after the heat declines to raise the temperature of the bed. Freshly-cut turf was laid over the bed with the grass side down, and the plants were put out on hills of good loam with a fourth part of rotted manure added. Cucumbers in frames ought to be watered overhead every afternoon in hot weather, and every alternate day if the days are dull and cold. Shut the frames up as soon as the water is applied. The best time is between 4 and 5 p.m. The plants must be looked over once a-week, and have all superfluous growths removed, for good Cucumbers will not be obtained if the leaves are crowded together.

#### PLANT STOVE AND ORCHID HOUSES.

A high temperature and moist atmosphere should now prevail in the stove, and also in the house devoted to East Indian Orchids.

Plants that require syringing should be thoroughly washed every day at least, even twice a day in hot weather, for thrips and red spider alike prey upon the young growths of many Orchids. Thrips do the most damage, and it is almost impossible to wash them off without great pains is bestowed upon the plants. Dendrobiums with short thick bulbs, such as *D. Farmeri*, *D. thrysiflorum*, *D. densiflorum*, &c., suffer most from thrips. They get down into the heart of the growths in the early stages of their development, and can only be dislodged by fumigating. Of course no thrips should be upon the plants, but they will be there even with careful management, and it is as well to know the best way to destroy them. Red spider attacks the older leaves, and can readily be washed off with soapy water, or by syringing the plants daily. We are now shifting a number of our Orchids into larger pots. Many of them are just making their growth, and at that time a large number of young rootlets are thrown out from the base of the young growth. If they are potted now, the plants have the season before them to make their growths. Some Cattleyas and *Laelias* succeed best in pots, others on blocks, and a few in baskets. When pots are used they are filled to quite three parts of their depth with clean potsherds; over the drainage we place clean live sphagnum, the potting material being turfy peat, sphagnum, and potsherds in equal proportions. A good block for Cattleyas is inch teak, cut according to the size of the plant. One of the best, perhaps it is the best, Cattleyas of recent introduction is *C. gignea*. We have a plant now in flower on a block with three flowers on a spike, and the plant in splendid health; another plant in a basket with peat, sphagnum, and potsherds, has not done nearly so well. The beautiful *C. superba* is also flowering well on blocks; it will do no good in a pot.

We also continue to pot any plants that require repotting as speedily as possible. When plants are being repotted the atmosphere should be moist, and the house also be kept close, and the roof shaded. When the plants have rooted into the fresh soil admit air more freely; good growths cannot be produced or matured in a confined atmosphere. If it is necessary to fumigate with tobacco at this season it must be done with great care; better to do it three or four times in succession than to give an overdose.

#### FLOWER GARDEN.

This department must now be kept scrupulously clean and neat. All bedding plants that required pegging-down have been attended to. Verbenas and other low-growing plants that have been put out to form rows in ribbon borders or edgings must be pegged to a uniform width; if the plants run into the next lines to them the effect is spoiled. Before pegging-down the plants the hoe ought to be run through amongst them. Any weeds that are left must be hand-picked, as the hoe cannot be worked amongst them afterwards. Put in pipings of Pinks; this work is always best done on a rainy day, they will then strike roots out of doors if put-in in a shady place where the sun acts upon them for an hour or two only each day.—J. DOUGLAS.

#### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

- FROME (Roses).—July 8th. Mr. A. R. Bailly, Hon.-Sec.  
 KILBEY.—July 8th. Sec., Mr. C. E. Braesbridge.  
 RICHMOND.—July 8th. Mr. A. Chancellor, Hon.-Sec.  
 NOTTINGHAM.—Bose Show, &c., July 8th, 9th and 10th. Apply to Alfred Kirk, Municipal Office, Nottingham.  
 OXFORD (Roses).—July 9th. Mr. C. R. Ridley, Hon.-Sec.  
 GRANGE-OVER-SANDS.—July 9th. Mr. Thomas Ashley, Sec.  
 HEWORTH.—July 14th. Mr. B. H. Felton, Heworth, York, Hon.-Sec.  
 OUDLE.—July 14 h. Mr. Alfred King, Sec.  
 TONBRIDGE.—July 14th. Mr. W. Blair, Free Press Office, Hon.-Sec.  
 WIMBLEDON.—July 14th and 15th. Mr. P. Appleby, 5, Linden Cottage, Sunnyside, Wimbledon, Hon.-Sec.  
 DARLINGTON.—July 16th, at Southend. William Hodgson, Sec.  
 BRAMLEY.—July 19th and 20th. Mr. R. Fox, Sec.  
 BRECON.—July 22nd. Mr. W. J. Roberts, Sec.  
 HELENBURGH, N.B. (Rose Show).—July 23rd and 24th. Mr. W. Urs, Waddell, Sec.  
 OLEKHATON.—July 24th. Mr. S. H. Williamson Hon.-Sec.  
 BRIDOR.—July 27th. Mr. E. Hardeman, Hon.-Sec.  
 PRESTON.—July 29th and 30th. Mr. W. Troughton, 4, Church Street, Hon.-Sec.  
 SHERWORTH.—July 29th and 30th. Mr. H. W. Admitt, Hon.-Sec.  
 SOUTHAMPTON.—July 31st and August 2nd. Mr. C. S. Fuldge, 32, York Street, Lower Avenue, Sec.  
 BEDFORD (Cottagers).—August 3rd. Mr. W. M. Hughes, Sec.  
 WESTON-SUPER-MARE.—August 4th. Mr. W. B. Frampton, Sec.  
 LILKINGTON AND SHEPHELY.—August 4th and 5th. Mr. R. Blount, Sec.  
 NEWPORT (MONMOUTHSHIRE).—August 5th.  
 OTLEY.—August 7th. Mr. Jno. Lee, Hon.-Sec.  
 ROSENDALE-NEWCHURCH.—August 7th. Mr. M. J. Lonsdale, Newchurch, Sec.  
 CANTERBURY.—August 12th.  
 BURNOFFIELD.—August 14th. Mr. J. Hood, Sec.  
 DOVER.—August 18th  
 NORTHEACH.—August 18th. Mr. J. Walker, Hon.-Sec.  
 EAS-BOURNE.—In the Devonshire Park.—August 19th. H. A. E. Rumble, Esq., 26, Hyde Gardens, Sec.  
 GLASTONBURY.—August 19th. Rev. E. Handley, Hon.-Sec.

HARTLEPOOL.—August 24th. Mr. Counsellor H. Magor, Hon.-Sec.  
NEWBERRY.—August 24th. Mr. H. Seymour, Hon.-Sec.  
LEAS OF TRAFLET (St. Petrus).—August 24th.

### TO CORRESPONDENTS.

"\* ALL correspondences should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (G.).—There was a new edition of the "Garden Manual" issued eighteen months ago, and is now on sale. We do not identify the Brier by your description, but the proper one for stocks is the Dog Rose, the prickles of which are hooked. (Young Gardener).—The book you mean is Mr. Thompson's "Practical Treatise on the Grape Vine," price 5s. Apply to Messrs. Blackwood, Palmerston Row.

FIR AND PINE (C. R.).—"Fir" is a popular name including all such coniferous trees as are included in the genera Pinus, Larix, Abies, Wellingtonia, and many others. "Pine" is also a popular name applied to many coniferous trees so differing that we cannot find space for the distinctions. There are the Ambroya Pine, Waymouth Pine, Moreton Bay Pine, Screw Pine, and many more.

VINES NOT FRUITING (*Vitis non Uvifera*).—We cannot understand the Black Hamburgh not fruiting from the lateral growths; we believe that you cut back too closely to the main stem at pruning time. Next year leave two or three eyes instead of one. In your district it will not be necessary to put slush on the borders to throw off the rains; place 3 or 4 inches of manure on the surface instead. This is presuming that yours is a late house; for early forcing it would be necessary to throw off the cold rains. The rest of your practice is correct.

CHINA ROSES CASTING THEIR BUDS (*E. C. Laming*).—We should attribute the casting of the buds to an imperfect supply of sap caused by the drought, which probably might have been overcome by copious waterings. The plants being only recently planted would not have obtained sufficient root-action to enable them to withstand drought.

TACONIA FIMBRISTIPULA (W. J. B.).—It is probably casting its buds from an insufficiency of moisture at the roots. We cannot otherwise account for it. Water thoroughly with weak liquid manure.

BRACCATHERA PROPAGATION (J. B.).—Take off the young stems close to whences they proceed after they have formed two or three leaves, and insert them in sand over sandy loam and peat in pots singly, and place in a gentle bottom heat and keep moist, but avoid making very wet. A temperature of about 10° to 15° warmer than that in which the plants are growing will answer for striking. They should not be inserted deeper than the base of the leaves. We have no experience of their flowering.

VINE LEAVES SHADING THE BUNCHES—STOPPING VINE SHOOTS (F. I.).—The leaves which shade the bunches of the Grapes should not be removed, they being the principal leaves, and the Vines being properly stopped you will not have too much shade. The main leaves must not at this or any stage be removed to permit of light to the fruit. Remove all the laterals from the shoots against the wall, except from the two lower leaves and the uppermost one to which the shoot was first stopped, and stop those at the first leaf, and as each succeeding growth therefrom to one leaf throughout the season. If by laterals you mean the side shoots upon wood of last year, they should be rubbed off to 12 to 15 inches apart, as we gave you instructions some time ago; but if you mean laterals on the cane of the present year's growth stop them at the first leaf, and to one leaf afterwards as succeeding growths are produced.

HEATING PIT FROM KITCHEN BOILER (H. W.).—It will answer to take the flow and return pipes from end to the boiler through the forcing pit, and also heating a cistern for baths, &c., upon a higher level, having a valve upon the flow and return pipe of the cistern, but you will need an air pipe upon the highest point of the pipes in the forcing pit, and this pipe must be taken higher than the bath cistern; in fact it would be well were its end taken to it so that any run or flow of water might be into it. Without a valve upon the return pipe of the cistern the heated water would rise through it. With this complication you will need to be careful, and not expedite a blow-up.

KALMIA LATIFOLIA NOT FLOWERING (E. N.).—Your plant only needs vigour. Give it some good turfy loam and cow dung in equal parts with your peat, and it will make better wood and flower freely. Add sand liberally if the peat be deficient of that substance.

PROVIDING BOTTOM HEAT (E. K.).—The best means is by a hot-water tank, and the next best means by hot-water pipes in a chamber, or the same surrounded by rubble. Tan is troublesome, but gives a long-continued heat—six months or more according to its extent. We could not tell you the expense of a "tan pit," and we do not recommend it for an amateur. The size would in a measure determine the cost, and if small the heat is not nearly so enduring. We strongly recommend hot water as best for an amateur or anyone not having ready access to fermenting materials.

WINTER NELLIS PEAR (C. R.).—It is probably a result of over-blossoming that your trees do not bring their fruit to maturity. We should advise you to scratch the surface with short manure, giving the tree against the south wall a thorough soaking before applying the manure, and water liberally in dry weather in summer. We would further advise thinning the blossoms, leaving the largest and most promising, and it is probable you will have as you say "truly one of the best of Pears."

PROPAGATING PANTHEMONS (E.).—Insert the cuttings in sand in September, and keep them moist and shaded for a time. They may be put in pots and be placed in a close cold frame, or have a bed prepared on the ground and a frame placed over it after the manner of striking bedding Calceolarias;

indeed they may be treated throughout the same as are Calceolarias. You can of course strike the cuttings now made from shoots which do not show flower spikes, but the plants would be large and require a proportionate amount of room in which to water them. We advise their being struck in September, when you will have fine plants for flowering the following summer.

MANICURE NINE AND AIMEE VIBERT (F. W.).—Let them have another season's growth; do not prune them too much, only thin-out weak branches, and most probably they will repay you another season. With good soil, liberal treatment of manure, and a moist climate, there will be naturally too great an inclination to wood growth.

SEEDLING STRAWBERRIES (W. B., Hants).—It is impossible to form any estimate of the seedlings. If thin let them remain, and transplant in the spring; but if likely to be overcrowded transplant a portion as soon as they are large enough to handle. They will not take up much ground, and will require very little attention, and it will be interesting to watch the results.

APHIDES ON APPLE TREES (W. H.).—The leaves are much infested, but no insects accompanied them. It appears to be the common aphid, and may be destroyed by a thorough syringing of softsoap water of a strength of 2 ozs. of soap to each gallon of water, in which is mixed a little tobacco water. If applied at a temperature of 100° it will kill all the insects it reaches, and will not injure the fruit.

MILDEW IN ROSES (H. B.).—This usually arises from defective root action. There must have been some cause other than its being grafted on the common one for your Black Oak to have died.

FAIRY RINGS (J. B., Bickley).—Fairy rings on lawns are caused by the spawn of a fungus, which keeps spreading outwards as it exhausts the soil upon which it has grown. To get rid of it water the ring with a solution of common salt, 2 ozs. to the gallon. It will cause the grass to become brown for a time, but it will soon grow again.

DYEING FLOWERS.—A Young Gardener wishes to know how Everlasting Flowers and Grasses are dyed. We shall be glad to receive information from any of our correspondents.

NAMES OF PLANTS (W. C.).—Every week we have to repeat our reply that we cannot name the varieties of florists' flowers, which Pelargoniums are, (W. B.).—*Lonitrea involucrata*. (Grasses).—*Eucalyptus europæica*, or *Spindle Tree*. (W. H. Oak).—It is *Lilium purpureum*, but this is only a variety of *L. Washingtonianum*. (Fried).—1, *Campocaulis glomerata*; 2, *Trollius europæicus*; 3, *Hemerocallis flava*; 4, *Lupinus polyphyllus* (?); 5, *Muscari monstrosum*; 6, *Hemerocallis flava*; 7, *Lupinus polyphyllus* (?); 8, *Orethys* (E. C.).—1, Composite, too young to name; 2, *Hemerocallis flava*; 3, *Orethys*; 4, *Lychnis coronaria*; 5, *Lychnis diurna flore-pleno*; 6, *Lavatera*; 7, *Lychnis coronaria*; 8, *Lychnis diurna flore-pleno*; 9, *Gonistis sagittalis*. (E. C.).—1, *Geranium sanguineum*; 2, *G. phœneum*; 3, *Gonistis sagittalis*. (M. G.).—1, *Listera ovata*; 2, No specimen received; 3, *Ophrys sphegodes*. Box all to pieces. (Somerset).—1, *Saxifraga umbrosa*; 2, *Corydalis lutea*; 3, *Oxycanthus floridus*; 4, *Veratrum virginicum*. (W. H.).—*Poa trivialis*. (C. R.).—*Dentaria crenata*. (E. B.).—We cannot make out the Grass, the spike having fallen to pieces. Send us a perfect specimen.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### LES BASSES-COURS DE L'ANGLETERRE.

#### PROLOGUE.

We shall not go round the world in any order, for we are erratic in our movements, and rush from poultry-yard to poultry show, up and down, all over the country, just as we have the inclination or the opportunity. The number of our chapters will consequently be uncertain, and the date of the epilogue promises to be a long way hence. The regularity of the numbers, too, must depend upon circumstances over which we have no control. Having thus much spoken for prologue we commence—

#### CHAPTER I.—WARMINSTER.

Warminster? Why ever Warminster? Peace-mainster we should have said, for everything with which we are here concerned seems to enjoy the utmost peace. Certainly there may be troubles ecclesiastical, but our Journal does not go in for that kind of warfare, and the Malays, the Poles, the Pigeons, the roses, "Angelina" and all, seemed in perfect and happy peace. "The Plovers," did some one say? Well, they found the peace too much for them, and betook themselves, we believe, to far-off golden climes, and idiots we call them for doing so, leaving that pretty rose garden with such aristocratic companions as the Malays must have been. But we must begin at the beginning.

When we reached the station we found Mr. Hinton waiting for us, for of course we came to Warminster to see him, and we soon find ourselves in his house. We had been there before, and now on this our second visit everyone seemed like an old friend. Directly we arrived we were met by two of Mr. Hinton's youngest daughters, little girls of five and six, such merry joyful little pets who really seemed glad to see one again. They came bounding in doll in arms, with Angelina between them (Angelina is the black cat you know), and to see the interest they took in the Pigeons and other live stock around made one feel and wish very strongly that all children might have opportunities of learning to love our interesting dumb animals. We saw the cups and the champion trophies of many a good show, and we saw on the centre table in the dining room the Oxford piece of plate. It was a small epergne of engraved glass and silver, and was full of the choicest roses, and on the table close by we saw our Journal. Everything on the premises betokened the same love for flowers and pets.

The days are long now, and the birds go to bed late, so Mr.

Hinton took us first for a drive, when, he said, we might at once see the country round and chat over favourite topics. And we did do both. We chatted on everything connected with the fancy, and on our hopes and fears for the coming season. There had been heavy showers in the morning which had freshened up everything, and bathed the trees in glistening gem-like drops. Mr. Hinton drove us through Longleat Park, and we may safely say we never enjoyed a drive so much. The rhododendrons were in full bloom, and every now and then a laburnum hung down its golden branches, and here and there were rare peeps of distant hills with a blue and purple mist upon them. We looked at them through dark frames of firs, and the effect was beautiful. But we must not linger too long on the way but return to the poultry.

Mr. Hinton has three establishments, we call them England and Wales, Ireland, and Scotland. We will speak of them separately. England is a rose garden with all the chicken runs round it, and Wales is tacked on at the side in the shape of a block of disused warehouses, where the Polands have state rooms in wet weather. Ireland is quite a little journey off from England. We had to cross a road and go down it some distance, and when we arrived there we found a long range of barns and sheds where the grown-up Malays live and some of the Polands. And then we went to Scotland, which is a large flower and kitchen garden where are two or three good runs, with a few more Malays in them, sheltered by overhanging trees and bushes. England certainly was rich in roses, but we could find no thistles in Scotland; instead of thistles we saw *Devoniensis* and *Madame Willermoz*, *Madame Victor Verdier* and *Céline Forestier*, and hosts more roses all with a wreath of bloom and buds.

But now for a more minute description of this England and its inhabitants. All the midland counties were planted with dwarf roses, and those round the coast were given up to the chickens. There were about 140 Malays and Polands in every stage of growth, all so healthy, all so bright and fresh-looking. Roses everywhere. Rose bushes planted in the runs made great masses of living shade where the Malay chickens rested and plumed their fast-purpling hackle feathers. Among them we saw two Whites. Mr. Hinton told us he had never bred one before, but these two came from the coloured birds, and very promising they were; one especially, a cockerel, looked as if he would do great things some day. Quite early some of the chickens were, and looking as if they knew almost what they had to do, so well did they eat and appear to thrive. In one corner of England, somewhere about Land's End, was the Pigeon house, and it was so well arranged that the birds walked out on a platform among honeysuckles and rose bushes. We saw lovely White Fantails and Black Baldpates all in the merriest state of cooing and showing themselves off to perfection. We left England and passed to Wales. We envied those large rooms with their dusty floors. In one we saw the king, he is the wonderful old cock which was first at Birmingham. He has been the glory of many a show pen, and splendid he looked, though he was fast losing his thigh feathers. Here too was a room with the baskets and food, and rose boxes, and moss laid out to dry to show the blooms on. Passing from here we went upstairs and found a splendid pair of Silver Poland hens in beautiful feather, and a capital match, heroines of many an exhibition; and here too were more Black Baldpates and empty spare rooms, only waiting for visitors in the exhibition season.

We left Wales and went to Ireland, on our way passing a house where blooms of *Maréchal Niel* quite hid the birds. We are certain the roses on this house could be counted by almost hundreds. We never saw a tree of even this luxurious rose with such a mass of bloom before. As we said before, Ireland consists of a row of barns; they were divided off by moveable lath lattices, and were a picture of all that poultry houses should be, all clean and covered with road grit and dust, with a copious supply of clean water. We noticed, too, a capital feeding pan, a contrivance of Mr. Hinton's to keep his Polands' crests from being soiled. It was a pan covered over tightly with a piece of large-mesh wire netting, through which the birds could feed without soiling a feather of their topknots. In these pens we saw the cup Dorchester Silver Poland cock, and the bird which won first at Reading and elsewhere last year, and we saw many beautiful hens with them. There were prize Malay cocks and hens there too, all looking ready to go out again and bring in more grit to the poultry mill, but Mr. Hinton does not go in much for the summer shows.

In Scotland we found the pens mostly empty. They were having a rest that the grass might grow and be fresh for the chickens when the time comes for them to leave England and to work for their living. We saw, however, here the first Swindon cock, and he in solitary exile in a large run was comforting himself by plucking his feathers and preparing himself for a fresh encounter in a new suit of armour.

We had now inspected the runs, and we could only stop and congratulate the owner on his great successes. Mr. Hinton has no fields and lawns, and free range for his birds—nothing but enclosed runs, and those not very large. Every inch of space was

made the most of, and everything was beautifully kept; consequently success is Mr. Hinton's, and so it can be anyone's who takes trouble to utilise to the utmost the opportunities he has, for it is surprising on how small a space and in the face of how great difficulties exhibition chickens can be reared. When we arrived at the house our time was drawing to a close, and when we departed presently with a huge bouquet of Mr. Hinton's choicest roses we not only carried away the recollection of a very pleasant day, but the gratification of feeling we had spent it with one who was not only pleased to show us his birds and flowers, but also to see us and to welcome us to Warminster.—W.

### BROODY HENS.

"C." warms for information how "to limit the time of broodiness" in his hens. They are Buff Cochins, Light Brahmas, and White Dorkings, but are continually broody, often for six weeks at a time; and as these birds, "C." tells us, are kept merely for laying purposes, these long fits of broodiness must be very detrimental to the egg-supply. These broody hens undergo all kinds of punishment for their natural propensities: "C." tells us he puts them in baskets, half drowns them, and ties them to the pailings, but all to no good. We do not wonder the first resort is fruitless, for we always use baskets to sit our own hens in, and no doubt these broody birds think they are placed in baskets for the same purpose. The cold-water bath is cruel and quite useless. We never heard of a hen being tied to a pailing for being broody, it is indeed making a martyr of her. Nevertheless, it seems to supply the cock with recreation, for "C." goes on to tell us "The cock vigorously resents the tying-up of the hens, and will sometimes try for half an hour to unpeck the knot, occasionally succeeding and triumphantly announcing that fact." On one occasion when the hen was for broodiness incarcerated in a hamper he was discovered to be busily engaged endeavouring to force a china egg underneath the hamper which he had obtained from a nest in the extreme corner for her to sit upon.

We are half afraid to recommend any treatment for these broody hens, for we fear the cock will be up to the emergency and outdo us; still we will give our own method. Before a hen becomes broody she always for three or four days gives forth a little incipient cluck, a grunt of imaginary pleasure perhaps. When we hear this, if we do not want the hen to sit we immediately move her into a fresh yard, where with fresh companions and fresh places to explore she generally loses the inclination. If, however, this does not answer, as sometimes happens, we move her into a run where there is no possible place for her to nest—where, in fact, there is nothing but the bare yard, and we find this speedily cures the most obstinate Cochins hen, and in three or four days they may again be restored to their former run. Of course where hens are bred for exhibition or for breeding exhibition chickens, it is most important that they should be allowed to sit once in the season to give the whole system a rest.—W.

### DRIFFIELD SHOW OF POULTRY, &c.

The annual Show was held at Driffield on June 30th in a meadow just on the borders of the town. The pens were very nicely arranged on two sides of the field, and were supplied by Messrs. Turner. Unfortunately the day was very wet, except for about two hours between eleven and one o'clock, when the birds were judged without having suffered much from the rain. All was well managed, and the best made of the matter under the circumstances; but the take at the gates suffered materially from the inclemency of the weather. Canvas was stretched over the top of the pens, and this served to some extent to protect the birds from the wet. The entries were very considerably in advance of those of any previous year, and the quality was good all through.

*Dorkings* were a good class, but many birds were out of feather. Whites were first. *Spanish* poor, except the winners. In *Cochins* were some good birds, but they were generally poor; as also the *Brahmas*. *Hamburghs* were very good; in *Spangels* first were Silver, and second Gold; and in *Pennils*, first were Gold, and second Silver; the single cocks being first Gold-spangled, and second Black. In *Game* the first in each class was very good, but the rest poor. *Game Bantams* good, the first Black Red, and second Duckwing. Blacks very good; and in single cocks the first was a handsome Duckwing, and second Black. Farm-yard crosses are generally such as we seldom find at any other show, and this was no exception. In the Selling class the first was a good pen of Malays, and second *Spanish*. *Turkeys* were a grand lot; and *Geese* only two pens of White, the first of rare quality. In chickens of this year the first were capital Dark Dorkings, and second *Game*; almost all coming in for a notice.

*Pheasants* were a splendid lot, there being scarcely any but that were well worthy of notice. *Carriers* were mostly young, but very good; the first, a Dun hen, was quickly claimed at £3 3s. *Pouters* were a capital lot, the first a very large Black cock; second one of the most stylish White hens we have ever seen;

and extra second a very large White cock. In *Jacobins* the winners were Reds, the first a hen, and second a cock; the first very small and neat. *Fantails* were all noticed, the first White, and second Blue. In *Tumblers* an Almond cock and hen were placed first and second, both grand in head qualities and well marked. *Nuns* were a good lot and well shown, and all Blacks. *Turbits* were a good class, the first Red, and second Blue. In *Dragons* a capital Yellow was first, and a Grizzle second. *Antwerps* were not good as compared with the rest of the classes; the first was, however, a nice Medium-faced Blue Chequer, and the second a Short-faced Blue with pearl eyes. In the Variety class the first was a Blue foreign Owl of great beauty, but rather dull in the eye; second a Black Barb; and third a Trumpeter, the class being good and many noticed. In the Selling class a White Pouter was first, and a Red Barb second. Very few pens were empty, with the exception of Mr. Harvey's, whose birds did not arrive in either poultry and Pigeons.

RABBITS were a good entry, and there was a capital tent provided for their protection. Lops were first; a Fawn doe was standing first, the measurement being 21½ by 4½; second a Tortoiseshell buck, rather small in the eye, 21 by 4½; and third a Tortoiseshell buck, 21½ by 4½. Himalayans were a very good class, the prizes being won by one exhibitor; the first with a young Rabbit, and second and third very large does. Pen 341 seemed a little worn with the journey. Silver-Greys very good, and placed as at several recent shows. Dutch a capital class, the first Blue and perfect; second Black, as also the third. In the Variety class first and third were Belgian Hare, and second an Angora.

#### Point cup for poultry won by C. Young.

**DORKINGS**—1, W. Morritt, Goolle. 2, Simpson & Dodds, Bedale. *Ac.* H. Pickles, Barb, Leeds. 3, H. Howarth, Barnby, Rochdale; W. Morritt. *c.* G. Pounder, Kirbymoorside; W. Leason, Driffield.

**SPANISH**—1, E. Newbitt, Epworth. 2, W. G. Waters, Elham, Brigg. *Ac.* T. P. Carver, Boroughbridge. *c.* G. Pounder.

JUDGE.—Mr. E. Hutton.

#### RIPON SHOW OF POULTRY, &c.

THE thirteenth annual meeting of the Ripon Agricultural Society was held on the 80th ult. Although not professing to take charge of the poultry, &c., yet the management and attention (especially as regards food and water) ranks in the first class, the consequence being that though the prizes are small the entries are good, but we believe we are warranted in saying that a better list will be offered next year. The pens were those of the Northallerton Society, of wood with loose wire fronts, and being placed under the trees with the backs to the sun, the birds were well protected from the scorching heat.

*Game* were poor, except the winners; the first Brown and second Black Red. *Spanish*, only one pen put in appearance. *Dorkings* good, and all of the Dark variety. *Light Brahmas* poor, but Dark a fair lot; the first a handsome pen. *Houdans* only three pens, and these fair in all points but comb. *Orpingtons* very good. In *Cochins* the first cock was a grand one, as also the second-prize hen, the rest being only moderate, except pen 355 (Blacks), which were pretty good for that colour. In *Gold-spangled Hamburgs* first were good and second moderate, these remarks applying to *Silvers* also. In both *Gold* and *Silver-pencils* the winners were very good, the rest only of moderate quality. Two classes for *Sebright Bantams* produced only three pens, the first in *Gold* being chickens. If we except the first *Black Reds* in *Game* there was nothing of note; but the *Blacks* in the following class were good, the hens especially. *Turkeys* large, and in splendid trim. *Geese* large, but bad in colour. *Ducks* pretty good; the first in variety *Black*, and second *Call Ducks*. *Guinea Fowls* were very good, but Mr. Young's pens were empty. In the Selling class the first were *Dark Brahmas* and second *Spanish*.

**PIGEONS** were more uniform in quality than poultry, not one class but contained some good birds. In *Carriers* the first were *Duns* and second *Blacks*. *Almond Tumblers* were very good in all respects, and every pen noticed. In *Tumblers* any other the first were *Yellow Mottles*, very good in head properties and colour; the second common self-coloured *Reds*, very sound and even. *Pouters* poor, except the first *Blues*. *Antwerps* were very good, but two pairs were disqualified as cocks in place of cock and hen. *Jacobins* good; the first *Yellows* and second *Reds*. *Fantails* were very good, the first being very well shown. *Trumpeters* only moderate, but *Barbs* good, the first *Black* and second *Duns*. *Turbits* were but a weedy lot, in which there was great room for improvement; but *Nuns* were really good. *Dragoons* were a fair lot, the winners being as near perfect as can generally be found when shown in pairs; the first *Reds* and second *Blues*. A neat pair of *Red Magpies* were the recipients of first, and *Yellow* of second honours, a grand pair of *Blacks* losing through dirt alone. In *Swallows* first were *Reds* and second *Blacks*. In the Variety class a pair of capital *Blue Foreign Owls* secured first honours, capital *Ips* Pigeons of the plain-backed kind being second. In the Selling class the first were *Black Carriers* and second *Dun Barbs*.

The youth of this neighbourhood seem to have a curious idea of what a Rabbit is, the class producing both Rabbit, Guinea Pigs, and Albino Rats, all very pretty and good in their own way, and consequently noticed, though the prizes as a matter of course went to Rabbits; the first to an Angora, and second to a Blue-and-white Lop.

**GAME**—1, W. Bearpark, Ainderby Steeple. 2, J. Robshaw, Whitley, York. *c.* J. Ianson, Howe, Thirsk; T. H. Foden, Givendale Grange.

Cook, Ripon (Guinea Pig); J. Simpson, Stanmergate, Ripon (Rabbit); W. Broadwith, Rainton, Thirsk (White Angora Rabbit); F. H. Hodson, Ripon (White Rat).

**JUDGES**.—Mr. E. Hutton.

## DARWEN POULTRY, &amp;c., SHOW.

The first Show that has been held for some years came off at Over Darwen on July 3rd under most gloomy and disheartening circumstances, the rain falling in torrents most of the day, in fact without the least cessation up to two o'clock in the afternoon, turning the ground into a perfect bog; but every possible precaution was taken to prevent the birds being wet before the judging commenced, with only partial success.

The entries in POULTRY were poor, and as a rule the quality not good if we except a few pens—viz., the Pile Game shown by Mr. Young, the Hamburgs in all classes, the Geese, and Ducks.

Pigeons were, however, a much larger entry, and the quality good. In Carriers a Dun cock of great size, young, and of grand properties was first; second a capital Dun hen, three very good Blacks being very highly commended. *Dragoons*, Blue and Silver, were not so good as we often find them in Lancashire, but the next class was grand; a most wonderful Red was placed first, and a Grizzle second, Yellows coming in for the other notices. Short-faced Antwerps were good, Silver Duns winning, but the Long-faces a poor lot. The winners in Short-faced Tumblers were both Almonds, but there were some good Blue Balts. In Long-faced Tumblers Black Balts won the prizes. English Owls were very good; a Blue first and Silver second, both cocks. Jacobins good; the winners Red. In Turbids the first was a handsome Blue; the second of that colour losing only through size. In Barbs a Red hen of high merit in head properties was first, a good Black cock rather bad on one eye being second. A Black Foreign Owl won first in the Variety class, the second being a Nun, and all the others were noticed, the class being very good. In the Selling class a pair of Yellow Dragons won first and Red Jacobins second, both pairs very cheap. Some likely birds were shown in the Flying class, all the prizes being won by the same exhibitor, and we were informed that these were well-known long-distance birds, the first being a Grizzle, and known locally as a "Tippler" cock, and second a Blue-chequered Antwerp. A class was provided for young birds in which the first was a Silver Owl, second a Blue Carrier, and third a Black Trumpeter, Mr. Copeman showing a very good Long-faced Silver Dun Antwerp; but strange to say two exhibitors who ought to have known better sent old Barbs to compete in this class.

RABBITS were not numerous, but the quality good. In Lops were three, first Black-and-white and second Tortoiseshell. Angoras were good, and three entries also; but in Himalayans were ten entries, but all poor except the winners Silver-Grey one doe, and a fair Rabbit. The Variety class had six, the first a Patagonian and second Black Dutch, but we preferred Mr. Irving's Silver Cream to either of these.

**GAME**.—1, O. A. Young, Driffield.

**BANTAMS**.—*Game*.—1, E. Hargreaves, Accrington. 2, Birethwith & Whittaker, Barmington. *Any colour except Game*.—1, T. Green, Crawshawbooth. 2, T. Cooper, Barm.

## BEE PROSPECTS, 1875.

The honey harvest for the year can now be fairly estimated in all places which do not depend upon the produce of heather, and curiosity is on the tip of expectation as to the probable display at the coming show at the Crystal Palace. I have come to the conclusion that our country here is singularly unfavourable to bees; whether it be owing to the climate, or our exposure to winds, or liability to drought, or from some other cause. For the last three weeks or more, in spite of thundery weather and some fine days, my bees have been doing almost nothing. May and early June swarms have not yet filled their hives with comb, although they were very large and have had every chance. In other hives the honey gathered in May has perceptibly diminished, and yet white clover superabounds in all directions, and bean fields are still in blossom, not to speak of quantities of buttercups and other wild flowers. My hives, too, are in fine condition—full of bees—choking up both stocks and supers.

We shall be anxious to learn from other parts of the country a report of proceedings, and request our friends to send us in their reports. It would be very interesting if to the reports were appended a description of the country round, the nature of the crops, whether woods abounded, and what flowering trees prevailed, also any peculiarities of climate or of atmosphere.

My own country is a wide plain, almost entirely consisting of pasture land, with numerous orchards around the houses. There is very little arable land, and we are sparsely wooded. May was fine and warm; June cold and windy.—B. & W.

## SUPERING.

YOUR correspondent, "F. J." like many other young apiarists, fancies that by supering his hives annually, and taking the honey from the top hives, and keeping the supers as stocks, bees could be managed profitably, and with the least trouble. He says, "If I were to work the hives on the nadiring system would not I be able in any good season to take off the top hives full of honey, and keep the nadirs for stocks, and the following year put nadirs under them and do likewise? But before putting on nadirs I should drive swarms out of them to increase my stock. By this way of working I need never have a stock hive older than sixteen months, the top and bottom hives to be made of straw 16 inches by 10 inches. I want to work the bees for profit, and fancy this way would pay best with the least trouble, but would be much obliged for your opinion."

"This way" has been tried by many apiarists, who find it very unsatisfactory in seasons favourable for honey-gathering. In seasons very unfavourable, the nadiring system of manage-

ment is equal to any other; but in such unfavourable seasons the nadirs are not kept for stocks. As soon as all the bees withdraw themselves from the nadirs, they (the nadirs) are removed, and the top hives placed on the boards. But even in favourable seasons for honey "F. J." would find that swarms taken from stocks would render enlargement by nadirs quite unnecessary for two months after swarming. The swarms would require more room before the mother hives, and nadirs may be profitably used with them when both honey and stocks are aimed at from swarms of the same season. Some apiarists put their first swarms into small hives with a view to obtain supers filled on them, and we are sure that "F. J." would realise more profit from his bees by swarming, and when necessary nadiring the first swarms.

We have recently said in answer to another correspondent that early swarms in good seasons do more work and rise to greater weights than non-swarmers, and also that nadirs used with non-swarmers have very often too much drone comb in them for keeping. It should also be borne in mind that nadiring does not invariably prevent bees from swarming. We have had hives with nadirs under them that sent off one and two swarms each. The loss of these swarms made us resolve never again to nadir a hive that has not swarmed. A little experience will enable our friend to feel his way to the best and most profitable mode of managing his bees. Meanwhile we advise him to increase the number of his hives by swarming till his set number of stands be covered.—A. PATTISON.

### NON-SWARMING HIVES.

In a former communication which appeared in this Journal May 20th last, I described a sort of hive which I considered likely to prove of great use, especially in small apiaries where a few hives only are kept, and that solely with a view to honey. This hive I stated might be made "24 or 28 inches long, 12 inches wide, and 9 or 10 inches high, with sliding divisions capable of being removed in the spring and replaced in the autumn." I added that "if such hives were made with bar frames an exact adjustment of plunder and convenient supply of food and breedings combs could be made every autumn, when the contracting slides are replaced for the winter."

I return to the subject, as believing my hive to be deserving of attention and trial, as the principle of it is certainly sound. I said that "hives of this sort are yet to be constructed, as I am not aware of their ever having been tried." Something of the kind, however, was tried by me with success several years ago. It was described and illustrated in this Journal under the title of "The Tasmanian Hive," because I first adopted it in Tasmania twenty years ago. I have one actually in use this summer, which was taken possession of by a fine stray swarm on the 13th of May. Although it is 21 inches long inside measure, but only 8 inches high and 9½ inches wide, it is quite full of comb and brood, and the bees are working well in a super. It has bars, but no frames, and moveable pieces of wood over the bars—as in the new bar-and-frame hives made and sold by Mr. Abbot—for convenience of easy access to parts of the combs without disturbing the rest. The hive I now recommend is a modification and improvement (as I think) of my old hive, which was inconvenient on account of its coming to a point at each end. My reason for not making more use of these hives is that they take up too much room in my bee houses and sheds; but if they were placed on single stands in the open air and properly protected they would be found to answer extremely well.

In managing hives of this sort there would be no need of using supers; for as soon as it was pretty well filled with honeycomb nothing would be easier than to remove one of the narrow boards covering three or four of the combs at either end, and with the aid of a whiff of smoke taking out a bar or two of honeycomb. A few turns, and the "slinger" would extract the honey if the combs were not such as could be eaten with the honey. The bars being then replaced, would soon be operated on anew by the bees, and would tend to divert attention from swarming, as well as to obviate the necessity of using supers. I venture to think that no hive would better suit those persons who wish to keep a few hives only with a view to the minimum of swarming and the maximum of honey, and for the benefit of such I now write.—B. & W.

### HOW TO HIVE A SWARM.

This is usually done in a very imperfect manner, and hence allow me to name the faults commonly observable:—1st, Doing useless things. Now, bees are apt to swarm on very hot days, and I am too indolent, or something else, to want to do more on a hot day than necessary. 2nd, Conforming to old stupid sayings and not to bee-instinct. When one studies the maxims of the past they find much good, but in bee-culture masses of error. I go for the true bee science. 3rd, Hence I use the simplest and best means. My hives are amid tall trees that

load me with apples, and hang with grape vines that give me half a ton of grapes. Hence I use a tall ladder, long sticks and poles, building in any tree a platform of boards to hive on. I shall now for convenience use the same tools or implements, even if I had no tall trees and long vines of grapes.

So let me lay down a few of my rules for hiving:—1st, Allow no one to stir or make the least noise while the bees are lighting. What! Not blow a horn, or ring a bell, or drum on a tin-pan, or throw dust or water? Not do anything? Yes, reader; just exactly do nothing but keep still. Now I have followed this rule in over eight hundred swarms I have hived for myself and others, and I tell you the broad fact that I never yet lost a single swarm in all that number—not one. Hence, if your noise or bell, tin-pans, horns, and other senseless confusion did good, you ought to beat me. But you cannot. I never lost a swarm yet, not one, even when they began to "go off," when I was obeyed; and if called to aid a neighbour, and he won't stop his noise and confusion, I "go off" because of his noise, just as bees are apt to do. Once a man a few miles out in the country came yelling like an Indian war-whoop, "Dr. Parker, come! Come stop this swarm of bees and I will give you five dollars." I tied my horse, stepped into the orchard, and said to wife and daughter, "Go to the house with those tin-pans; my boy, take the house bell in and stop your tin-horn;" and to the farmer, "Stop throwing dirt;" and to the hired man, "Take the pail of water to the house." All was quiet, but the dog running about. "Call him off there under that tree." So I quieted the confusion. Then I stood still; and the bees, soared no longer by the unusual noise, stopped and lit on the last apple tree, just as they would have done on the nearest tree to the hive they came out of had they been let alone.

So, I say, it is your tin-pans, noise, and running about that drives bees off to the woods, and as a wise bee-keeper you ought to know better. Now, let me tell you another fact. Bees will not go 200 feet from the hive they come out of if you let all be perfectly quiet and there is anything to light on. My bees, not one out of a hundred swarms go even 100 feet before they always light. So make it a rule to have no stirring, no noise, but all quiet until they are well lighted. Then bring out the hive from the cool cellar—where it has been put a day or two lest it get damp and mouldy—neat and clean, and as you of course have the strips of boards or sticks, boards, hiving cloth, &c., proceed to place your ladder and platform in the tree or on the ground, and other appliances, so that before the last bee has lit you are ready to hive them.

2nd, Never put a swarm directly into a hive. You ask, Why not? Because if you do the bees may not know it is a hive they are in, but only think they have had a slight accident or jar while yet on their lighting-limb or place; so they will leave the hive and go off to the woods, because they don't know they are hived. Hence you will place the hive so that when shaken off of the limb they lit on they will have to creep buzzing into the hive, and all go voluntarily up on the inside of it. Then they will not make the mistake of thinking they are not hived, but will know they have accepted a hive.

3rd, You need not be very quiet or slow about making the bees go in the hive. You minded the bees until they lit, now is the time to change and make them mind you. So a gentle rudeness in shaking off the limb is as good as saying, "Bees, you have left your lighting place." If they don't go in the hive readily take a dipper or flat piece of shingle or board, dip up a few, a pint or so, and shake them roughly close by the hive, as if to say, "There is the hive; why don't you see it?" Then brush rapidly but gently the rest towards the hive, as if to say, "Go in now, right away, no loitering; I tell you, my bees, go in." Those that crawl up the outside of the hive brush off and push back as far as you can away off from the hive, as if saying, "No going up the outside of the hive; go in or clear out." Thus you will learn yourself to be prompt, so gentle as not to be stung, and yet so rough as to make them obey. I have thus often made all the bees of a swarm, said to be too lazy to get into the hive, all go in in ten minutes, time and again. They will thus go in, even if they cannot all stay in the hive.

4th, As soon as the most of them are in, be ready to remove them to their permanent stand. Thus you avoid the coming-out of a second swarm, and the lighting and commingling of two swarms. Thus you get rid, too, of the few bees always uneasy and flying about the swarm, and who doubtless are the ones who find and lead the swarms off to some hollow tree or log in the woods. These bees are rarely over twenty to fifty in number, often not ten of them. Suppose the new hive is on a platform 20 feet from the ground, and all are in but a quart on the outside the hive, and fifty to two hundred flying in the air (there are really less than that usually). Now I raise the ends of the hiving cloth and tie it over the top of the hive closely. The quart of bees outside of the hive are fast between the hive and cloth, and not one can escape. The most of those flying about the hive will see the change as you take it down the ladder slowly, and go to the permanent stand. You set it down when and where as it is to be. Untie the cloth and drop the

ends. In an instant the bees out of the hive comprehend their situation, and fly about the hive and not to their lighting place. The same is true if a tin-pail, the light basket, or other receptacle has been used to bring the bees to the hive when placed on the ground, or other plan has been used to hive them. Now, immediately take out the hiving cloth from beneath the hive, and adjust the hive in its permanent shape or height, or other place and form it is to have.

Reader, the process I have described is often done by me, so that in twenty minutes from the emergence of the swarm the whole has been completed; and rarely does it take over thirty or forty minutes. And its advantages are that it gives the bees no time to be angry, saves your own time and care, and is such that you, as I, can do it alone, without the least assistance.

5th, Remember to shade the new hive from the sun until the hatched brood is in the new combs. Last summer friend said, "See here, doctor, these two hives are deserted with some combs in them." I said they were not shaded. He replied, "Yes, they are; see these two boards on the west side of them." There were two small boards, but quite out from under a peach tree they stood, with the unobstructed broiling sun from the west of a hot afternoon blazing on them. Shade effectually all new-hived swarms.—(*Germantown Telegraph*.)

[Let me here say that Dr. Parker cannot speak too strongly in pointing out the folly of making noises from horns and tin kettles to prevent bees from going off. Such noises do no good whatever, and may do some harm. Bees in a swarm follow the noise they themselves make; and all such sounds as come from bells, horns, and kettles tend to confuse and confound bees in swarming. The doctor is quite right in saying that swarms seldom go 200 feet from their old stand.]

We think he is wrong in saying that if bees are hived as soon as they alight on a tree they may not know that they are hived. They are not so stupid, and know well when they are comfortably housed and protected. Generally speaking, we let the bees of a swarm alight and cluster, and speedily shake them into a hive, and place the board over them for about half a minute; then turn the hive over in its natural position. All this is done in less than five minutes. A platform erected or a table placed near for the swarm to stand on is quite unnecessary in this country. If a swarm alights on a high branch of a tree the branch is out and let down, and hived with the swarm—that is, the hive is placed over the swarm. If the branch cannot be out, the swarm should be hived aloft, covered with a cloth, and let down.—A. P.]

### OUR LETTER BOX.

**AGE OF CHICKENS (Puzzled).**—The age of chickens exhibited depends much on the time of year when the exhibition is held. The age of chickens is not counted by the time that has elapsed since they were hatched, but they are, although hatched during the first week in January, chickens till the following New Year's-day. Thus, in November, in the class for "chickens of 1875," there may be two pens side by side, one hatched in June five months, and one hatched in January eleven months old; both equally eligible, but the oldest have all the advantage. In the old days of exhibiting a pen consisted of a cock and two hens. If you were to write to a dealer for a pen of fowls he would not send you less than three hens or pullets, perhaps four. The Bath and West of England Show is always held in June.

**DEFORMED COMB (H. B.).**—Your cock has that which is called a lop comb. It is a very serious defect if the bird is wanted for exhibition. It amounts almost to a disqualification. It is of no importance if the bird is used merely as a domestic fowl and food-provider. Sometimes a comb will fall over, especially in the spring and summer, from sheer development, the result of good keep and condition, and afterwards, when the cold weather sets in, it will shrink and shrivel, and resume its former shape. This is, however, only an exception. If you wish to breed perfect or exhibition birds you will not do so with him. A defect is generally hereditary. If, as you say, he has no other fault, you should find a ready sale for him; he is probably worth 12s. or 14s.

**DUCKS CHANGING COLOUR (Tarpel).**—Ducks of unquestioned purity during many generations, belonging to a black breed, never become suddenly white. Degeneracy from interbreeding shows itself by occasional white feathers, then white spots, at last by a pied plumage. "No Duck becomes suddenly white." If such a thing should occur it would happen only to one, it could not be the case with a number. On the other hand, if there be a bad drop in one of the parents, if at some time or other one of the progenitors formed a *malveillance* and consorted with a white Duck, the produce, although themselves perfectly black, may at times have a white descendant. It is a very rare event, and occurs only just often enough to show there is a Nemesis for those who dictate to or play with nature. We have always been grateful that we read the very useful paper in the *Spectator*, wherein the reputation for depth of character and great knowledge was gained for Sir Roger de Coverley by a certain shake of the head, and when referred to on a knotty case, saying, as Chairman of Quarter Sessions, "Gentlemen, there is much to be said on both sides of the question." We echo his opinion; but, we think all the Ducks of the same colour are very nearly related.

**SUPERING (Triceps).**—The alits between your nadir and top hive are too narrow for the loaded bees to pass through. Some of the pellets on their legs are knocked off while the bees are attempting to pass through the alits, and some of the bees wander about, going in and out with the pollen on their legs, not knowing what to do with it. Remove the zinc with the alits, and let the bees have a free open passage between hive and hive, and they will not be found leaving their hive with yellow balls on their thighs. When bees

have combs in which to deposit their burdens of pollen they will not carry them out of the hive or drop them on the board.

**CANARIES TURNED INTO A ROOM (A Constant Reader).**—The turning of the two-months-old birds into a room would sooner tend to increase their song than otherwise, and the birds would become stronger thereby, especially if supplied with a daily bath. The change would not prevent them again singing when caged off in the winter. But why cage them off in the winter? They would do as well in a room during winter as in summer. Keep the old birds in cages, for, unlike the young of this season, they will have to eat the whole of their feathers, wings and tails included, whereas the young birds will only throw off their body feathers. If old and young were kept together the appearance of the quills shooting forth about the wings and shoulders of the old birds might induce the young to draw blood. The habit once commenced would become troublesome, and the mutilation would very much disfigure the birds. Nothing but parting them would cure the mischief, but "prevention is better than cure." Where you have not space at your command to keep old and young separate you must keep the room in a state of semi-darkness, especially during the time the birds are moulting. This is best done by covering up the window with a cloth, leaving just sufficient light for the birds to find their food. It will not prevent them singing, for they will soon become used to the darkness.

**TARRAGON VINEGAR (Alicia).**—Take some tarragon; dry it in the sun, and then put it into a jar which fill with vinegar. Let it infuse for a fortnight, then draw it off, express all the liquid from the drug, and filter the whole; bottle it, cork tightly, and keep in a cool place.

### REMARKS.

30th.—Dull but fair till 2 P.M., from which time till 5.30 frequent showers (some of them heavy); fair afterwards.  
July 1st.—Showery all day; rather finer towards the evening; and a starry night.  
2nd.—Fine all day, but still not warm for the time of year.  
3rd.—Wet morning, and showery all day; thunder at 3.40 P.M. and for some time after; finer towards the evening.  
4th.—Wet early, but cleared up before 10 A.M., still rather dull till 5 P.M.; very fine the rest of the evening.  
5th.—Fine all day, but rather cloudy between 5 and 8.30 P.M.  
6th.—Another very fine day, though still cool; very clear at night.  
A cool summer week, with heavy rain in the earlier part.—G. J. SYMONS.

### COVENT GARDEN MARKET.—JULY 7.

We have now a very full supply, of soft fruit in particular, which in bulk is selling low. Hothouse Grapes and Pines have also experienced a considerable decline.

From observations taken near London during forty-three years, the average day temperature of the week is 74.7°; and its night temperature 50.4°.

## POROUS GARDEN POTS.

THIS matter is alluded to on page 416, vol. xxviii., by "G. S.," and subsequently by others, and the experience of cultivators is solicited. The subject is an important one, as flower pots hold a primary position amongst the gardener's means and appliances. I have given some attention to the subject both as to growing plants in porous and non-porous pots and tubs, and to a comparison of the condition of plants grown in washed and unwashed pots. My experience convinces me that neither thoroughly glazed nor extremely porous pots are the best for plants generally. I say generally, because particular plants will flourish in glazed pots, while others prosper better in those which are porous. To say that experience has settled the matter that plants thrive as well in glass or slate as in earthenware pots I think requires some qualification. In the first place, glass pots have not been in general use sufficient to prove their suitability, and I am not acquainted with a single cultivator who would entrust either a valuable Orchid or a prized Heath in a vessel of glass, because experience has proved that an epiphytal plant thrives best in a porous pot, and that in a glazed pot there is much danger that plants with hair-like roots, as Heaths, sustain injury by an excess of water which cannot evaporate. But why give an excess of moisture? There is the point.

It requires a very good judge to hit on the exact time that a pot should be soaked with water. Correct watering is the very essence of plant-growing. Soil and temperature avails but little if sound judgment is not exercised in applying water. Faulty watering will render inert the best soil; for if water is given in excess the soil is made sour, and if it is unduly limited its virtues remain insoluble, and the plant languishes. I once nearly lost a situation by watering a specimen *Erica* a few hours before the time that the plant really needed the soaking. That plant was in a slate pot. Had it been in an ordinary clay pot the danger would not have been so great, and the gardener, who was one of the best plant-growers of the day, always regarded slate pots as dangerous, not because the plants (Heaths) would not flourish in them, but because an accident of overwatering was ever liable to happen, and when it did occur the consequences were more serious than if a plant were in an earthenware pot. It may be stated without hesitation that for ten men who aspire to take the charge of plants, and who consider themselves proficient, not more than three of them are really competent in the matter of watering. All who have the responsibility of valuable plants know that this statement is correct, and that the greatest trouble a thorough plant-grower has to contend with is the want of knowledge or care on the part of his subordinates in the matter of plant-watering.

Plants which are growing in non-porous pots, and especially in peat soil, are more liable to injury by an overdose of water than if they were growing in earthenware

pots of, not extreme, but medium porosity, and it is more difficult to determine the precise time at which water should be applied to plants in pots of the kind first mentioned than in those of the last-named material. That conclusion is arrived at after many years' actual experience in plant-growing. On the other hand, coarse ill-burnt clay pots are not to be trusted to grow fine-rooted hard or softwood plants, for in these there is great danger of them receiving injury by the other extreme of sudden changes from excessive wet to extreme drought consequent on too great evaporation. Not many good plant-growers would prefer a pot of this nature any more than they would one having its pores absolutely closed.

For most plants, including fruit trees, pots made of smooth clay and well burnt are the safest and most satisfactory to use, as less skill and attention is necessary in escaping the ever-present liability of hasty watering on the one hand and tardy applications on the other. Pots which are excessively porous are suitable under certain circumstances and in certain seasons which under other conditions are quite inimical. *Cinerarias* and *Ferns*, for instance, will, if in a pit and towards the autumn months where they stand on a moist bottom and where the pots are never absolutely dry, grow much faster in porous than they will in glazed pots; but if these porous pots were exposed to the sun and air the *Cinerarias* would curl and the *Ferns* would wither. It is the nature of the plant and the position it must occupy that will best determine the nature of pots to use. Taking all things into account the great majority of cultivators will, and do, find that the pots which are the most safe and satisfactory are not soft and open clay pots or those which are quite impervious to air and water, but earthenware made of smooth well-tempered material and thoroughly-burnt pots, to apply a plain test, on which we may write the names of the plants with smoothness and comfort instead of those which grind the lead of the pencil after the manner of a rasp or grindstone.

Some plants, as *Musk*, *Myosotis*, *Spiræa japonica*, &c., will thrive admirably in smooth glazed pots, as large quantities of water do not injure them. So also will *Ferns*; but ordinary hard or softwooded plants do not thrive so well as in earthenware pots, to which their roots cling and become increasingly fleshy, vigorous, and absorbent by contact with the porous sides of the pots. Do not the roots of such plants derive support from the porosity of the pots admitting air to the roots? If in the pots is placed open material, such as crocks, the roots are more healthy than in the close soil; so are the surface roots of many plants—roots which protrude through the surface. Such roots by an absence of light and a sufficiency of moisture are invariably bristling with fleshy spongioles, which certainly derive considerable nourishment from the air. These spongioles are finer around the sides of a clay pot than they are when in contact with a smooth polished surface impervious to air, and this demonstrates the superiority of the earthenware pots.

Yet very porous pots are at times injurious, or permitted to be, by being placed in the full rays of the sun

in summer. Much injury is done by this exposure. The pots in which plants are growing should at all times be shaded when standing in the open air in the summer months, either by plunging, placing one pot within the other, or by other efficient means. The roots either of a plant or tree cannot but be injured if the sun has full play on the earthenware pot which contains them; but preferable to painting is shading. Painting may do no harm in the summer, but at some time and with some plants clean-washed pots are certainly preferable to those sealed against the admission of air.

With plants growing to be shifted on, pots are preferable to tubs; but with trees perfected, as Bays, Aloes, Palms, &c., to which it is inconvenient to add more root-room, and where the roots are extremely matted and all the water that can be given is necessary, then stout wooden tubs are advantageous; they do not, by their comparative non-conductibility, part with moisture and admit heat as do pots, and hence their adoption on the continental terraces. If these tubs are painted a light colour to repel the sun's rays, instead of a dark one to absorb them, they answer their purpose still better. But while plants generally flourish best in earthenware pots, those which are porous should not be exposed to the full sun—indeed very soft pots are not the safest to use, and should never be used, when new, without first being thoroughly soaked in water and then permitted to dry. This is a little matter of considerable importance, and should never be neglected.

Smooth clay pots washed clean inside and out, and dried before using, are the pots which I have found the most generally satisfactory in dealing with a mixed collection of plants, and in keeping them in the best condition during the different seasons of the year. That a plant may be seen occasionally to flourish in a dirty pot or a glazed pot is more due to the surrounding circumstances being, what may be termed, locally favourable than to any intrinsic merits of such pots. The practice, I venture to say, of general cultivators is overwhelmingly in favour of clean, well-finished earthenware pots as the best for plants generally, and there is little fear of them losing the position they have attained of being almost exclusively used by the best cultivators of plants.—*EX-EXHIBITOR.*

### CONCERNING ROSES.

THE first series of Roses here is now over. They began blooming June 7th in the open ground. The blooms have been abundant and magnificent. They are making new wood plentifully for the next series. A gentleman who visited the Crystal Palace Rose Show told my housekeeper in my absence that the Roses there were a joke to them. I cannot, therefore, think that I am so ignorant on the subject of Roses as some try to make out.

If the reader will refer to page 486 he will see that I did not recommend Madame C. Jéguenax as a fully expanded Rose for button-hole purposes. Of course, it would be too big for the purpose. My words were, "These should be in bud form, or only partially expanded." On this mistake Mr. Peach founds his merriment. Let us see the opinions of other rosarians who may be supposed to know something about it. I refer to three Roses to which Mr. Peach has objected, or called trash—namely, Abbé Bramet, Maxime de la Rocheferrie, and Baron Chaurand, three Roses of choice and excellent colour. Mr. W. Paul in his able work on Rose culture, page 87, names Abbé Bramet with other Roses of 1871, and adds, "These have already taken a place among our established favourites." Of Baron Chaurand in his catalogue he thus speaks, "Velvety scarlet, centre shaded with blackish purple, large—[It is not large here.—W. F. R.]—full, and of finely cupped form, foliage fine; one of the best dark Roses! The following is the opinion and description of Mr. Van Houtte of Maxime de la Rocheferrie:—"Beautiful, velvety, blackish purple, large and full. Splendid." If I have erred in respect of these three Roses I have erred in good company. We must, however, make an allowance for difference of tastes.

The following are good button-hole Roses in bud form before expansion, and they are beautiful—Mme. La Baronne de Rothschild, Mlle. Eugénie Verdier, and Solmaterre. Probably Bostan d'Or would be good for the purpose. I do not keep it. Now a word about Madame Lacharme. I have just bloomed six plants of it. It is very beautiful, but it soils in foul weather, is flimsy in its petals, and scentless. I recommend it highly for pots under glass. It casts an abundance of single blooms. Since Louise Magnan's time I think it is the best in the white line, being slightly tinted.

These are fine Roses—Marquise de Castellane, one of the finest of late years; Comtesse d'Oxford, and Etienne Levet. The last is scentless. The next two are, at any rate, successful garden Roses—Pierre Seletzski and Hortense Mignard. I have had a lot of successful blooms, not one bad one, of Firebrand. Von Moltke is very beautiful. The plant, however, of it is at present very weak. We cannot fully estimate Roses till they are on strong stocks. The form of François Michalon is excellent, but my three plants of it do not grow well here. Perhaps the winter injured them. St. George is about to bloom and looks hopeful. We want more dark colours. The crimson and maroon look well in foul weather, and at all times set off a rosery. We are sick of rose colours.

One word about cut-backs. I quite agree with what Mr. Peach and Mr. Camm have said on that point. Some of the Roses here that I have had for years reach 4 inches in diameter, and some are more than that. Mr. Prince gave me Paul Néron on his seedling Briar, its second year here. At 4 feet from the ground the bloom measured 5½ inches! I am not a great lover of very large Roses, but there is a coarse taste for and love of "whoppers." This is specially the case with garden commodities—Potatoes, Cabbages, Onions, Cucumbers, Melons, Carrots, and Parsnips! Most people's idea of a show Rose is, that it is a "whopper." Let us hope that a better taste may arise.

The most perfect Roses are the medium-sized varieties—viz., Duchesse de Caylus, Madame Rivers and Vidot, Océide de Chabillant, William Griffiths, Devonians, and Souvenir d'Elise Vardon. I wish the Rose-raisers would produce a Rose of the colour of the Austrian copper, or cross one of our yellow Roses with it.

I must now thank Mr. George Paul for three excellent Roses—Lord Clyde, Princess Mary of Cambridge, and the Duke of Edinburgh; and I must thank Mr. William Paul for the following excellent Roses—Lord Macaulay, Lady Suffield, and Firebrand, and trust that I shall find Queen of Waltham and Star of Waltham as fine as their seductive portraits.—*W. F. RADCLIFFE.*

### ROYAL HORTICULTURAL SOCIETY.

#### THE GREAT SHOW ON THE 21ST.

IT is with great pleasure that we are in a position to announce that, by way of showing their approval of the changes that have recently taken place in the Council of the Royal Horticultural Society, the exhibitors at the shows have combined to make *gratuitously* the Exhibition that is to be held at South Kensington on the 21st one of the finest the Society has ever held. Those who have already signified their intention of co-operating are Messrs. Veitch & Sons, Mr. B. S. Williams, Messrs. J. & C. Lee, Mr. Bull, Mr. Charles Turner, Mr. Standish, Messrs. Osborn & Son, Mr. Wills, Mr. Outbush, Mr. Laing, Messrs. Paul & Son, Mr. Parker, Mr. W. Paul, Mr. Ley, Mr. Moore, Mr. Wimsatt, Mr. Barr, Mr. Burley, Mr. Harrow, gardener to Mr. Beaumont; Mr. Hudson, gardener to Mr. Im Thurn; and we are told there are many others expected whose names have not been received.

In reference to this Mr. Turner writes—"Roses will remain good till the 21st, and I have no doubt you would have a good show not for competition. The bloom will be prolonged on account of the rains." It is to be hoped that this will be the case, for Roses would be a great acquisition, and they have scarcely been seen at South Kensington this year.

No more graceful compliment could be paid to the present Council, and nothing could more show that Horticulture is not dead, but that there is a power in it which only needs the opportunity to have it called forth. Let the Council only have the arrangements favourably completed with the Royal Commissioners, which is the only delay at present, and there is nothing between the Society and perfect success.

CEREUS GRANDIFLORUS.—I enclose you a photograph of one-half of the Night-blooming Cereus which I gave an account of on July 13th, 1871. It has just finished blooming this year. It has had 295 flowers out. It had 168 open the night we had it photographed, which I believe to be the greatest number of flowers that was ever seen on any plant of the

same kind in this country. If any of your correspondents know of one having more perhaps they will communicate the fact in the Journal.—R. MANTLAND, *The Gardens, Pendryffryn.*

## ROYAL HORTICULTURAL SOCIETY.

JULY 25TH.

A SPECIAL General Meeting of the Fellows of this Society was held last Thursday afternoon in the Council room, South Kensington, Viscount Bury in the chair. The Meeting was convened by the Council of the Society in accordance with the following requisition, which was signed by more than twelve Fellows:—"We, the undersigned Fellows of the Royal Horticultural Society, respectfully request the Council of the said Society to summon a General Meeting of the Fellows with as little delay as possible to consider the conduct of Lord Bury, Sir Coutts Lindsay, and Messrs. Bonamy Dobree and Burnley Hume in reference to the non-completion of their resignations, and other matters that it may be deemed necessary to introduce to the notice of the Meeting under the head of acts and doings of the above-mentioned gentlemen during and in connection with their membership of the Council, and also for the purpose of conferring with the Council as to the steps that should be taken to extricate the Society from the difficulties under which it is placed from the obstructive position assumed by Lord Bury, Sir Coutts Lindsay, and Messrs. Bonamy Dobree and Burnley Hume in the non-completion of their resignations."

The Meeting on Thursday was very largely attended. Amongst the members of Council present were Admiral Hornby, Dr. Denny, Dr. Hogg (Secretary), Mr. W. B. Kellock, Mr. B. Hume, Mr. Bonamy Dobree, Mr. Webb, Mr. Houghton, Mr. H. Little. Amongst the general body of the Fellows were Lord Alfred Churchill, Sir Alfred Slade, Bart., Mr. W. A. Lindsay, Dr. Masters, Mr. Chetwynd, Mr. Pownall, Mr. Shirley Hibbard, Mr. Bull, Mr. H. J. Veitch, Mr. Quilter, Mr. S. H. Godson, Mr. Godson, jun., Mr. Peter Barr, Mr. Liggins, Mr. Noble, Mr. Wills, Mr. Turner, Mr. Bragg, Mr. Deal, Mr. Murray, Mr. Guedalla, Capt. Mackenzie, Mr. Pinches, &c.

The CHAIRMAN said: The Assistant Secretary will read the notice calling the Meeting.

Mr. DAVENPORT, Assistant Secretary, then read the notice.

The CHAIRMAN.—Is it your pleasure that the minutes of the last meeting be taken as read?

Several FELLOWS.—Let us take them as read.

Mr. S. H. GODSON.—How can you take these minutes as read when this is a special Meeting? I object to their being taken as read, and I move that they be read [hear, hear].

Mr. PINCHES seconded the motion, which was carried.

The ASSISTANT SECRETARY was reading the minutes of last meeting when

Mr. BRAGG, of Birmingham, said he protested against the reading of the minutes, that being a special Meeting called for a special purpose [hear, hear].

The CHAIRMAN.—I am of opinion that the minutes ought not to be read, and I think we had better proceed to the business of the Meeting. This Meeting has been convened by the Secretary "to consider the conduct of Lord Bury, Sir Coutts Lindsay, and Messrs. Bonamy Dobree and Burnley Hume, in reference to the non-completion of their resignations, and other matters that it may be deemed necessary to introduce to the notice of the Meeting under the head of acts and doings of the above-named gentlemen." Well, I am sure we shall listen patiently, and I hope with profit, to the accusation which it appears is about to be brought against myself and my friends; and of course I will reserve to myself, and my friends will reserve to themselves, the right of making some reply if we fancy anything said against us in this room should be commented upon. At the outset I may say I have been informed that a letter of mine which appeared in the *Times* has given some pain to my former colleagues. Several members of the Council—[here there were cries of "question" and some interruption]. I was simply going to make an explanation which I thought would be acceptable to these gentlemen [hear, hear]. It seemed to me that it was the Council of which I was a member which had formulated the act of accusation, but I beg to say that explanations have been offered to me which have removed that impression from my mind. The Council did not promote this Meeting, they did not write the notice, and are no more responsible for it than I being obliged to call the Meeting in accordance with the requisition. I must say that when I saw the name of Dr. Hogg to it I thought the Council were responsible for it, but I do not assume their responsibility, and am therefore perfectly ready to accept the explanation that they were acting in their ministerial capacity. I should have been sorry if it was my own colleagues who called it, and I am glad it was not. Having listened to all the accusations that may be brought against us, I think a very few words will bring the whole matter straight before you.

Mr. J. B. PHARSON of Chilwell, near Nottingham.—I have come a distance of 120 miles to be present at this Meeting. That to some people may not be a matter of importance, but to a busi-

ness man like myself it is, I assure you, a matter of importance [hear, hear]. I have never seen anything to surprise me more than to witness your Lordship occupying the chair to-day. I thought you resigned your position as Chairman of the Council. You received a vote of thanks, and we of course thought you were gone [laughter and "no, no"].

A FELLOW.—I say to that "Certainly not" [hear, hear].

Mr. PHARSON.—I am only giving my own opinion. You had resigned, and others of the Council had resigned, and I beg leave to say if I am wrong I shall be glad to be corrected. The fact is, Lord Bury's carriage stops the way; and does Lord Bury think after publicly giving up his office that he is entitled to take that chair again? In any case the general impression in the country is that for some reason or other it was advisable that Lord Bury should vacate that chair, and that some other individual should take it. If Lord Bury thinks he is still Chairman after having given up his office of Chairman, I feel that is carrying matters rather too far.

Mr. S. H. GODSON.—Unless this gentleman concludes with a motion I object to him saying anything further on this subject [interruption].

Mr. BATEMAN.—I am sorry to anticipate the speech of that gentleman. I signed the requisition in no spirit of animosity to any honourable gentlemen, but with a view to put an end to what was likely to bring about an inevitable crisis [hear, hear]. I thought you were going to speak of the circumstances under which your resignations were brought about, and I thought you were about to explain the circumstances under which those resignations were not completed. I do not know what explanation you have to offer, but I know a long-looked-for crisis is coming on which, in the interests of the Royal Horticultural Society, ought to be prevented [cheers]. I am a very old Fellow of the Society, having joined it nearly fifty years ago when crisis No. 1 was brought on thirty years ago by great expenditure. It was freed from that crisis by my late lamented friend Dr. Lindley, and from that time the Society had for a period of twenty-five years uninterrupted success and prosperity. But old leaders of the Society fell off, and from competition and other causes they got into financial crisis No. 2. They got out of their difficulties then by the action of the late lamented Prince Consort, who was unfortunately taken away from them too soon, as no sooner had the nuptials been celebrated than the Prince was taken away from them. After him there arose a cruel king, who seized the position, kept them *in terrorem*, and made them utterly powerless. And with such skill—though not one of us was responsible for the position of the Society no more than the youngest Fellow now in the room—with so much skill, I say, were these things manipulated, that one concession after another was extorted from us. It was perfectly natural that under the circumstances the local Fellows should take alarm, and I trust that by this time they have become disenchanted with the idea that they had only to try in order to become masters of the situation. We know we are now in the agony of a great crisis, and the question is, What are we to do? I should like the past to be forgotten, and although I may not agree with the Council, still I give them credit for what they have done [hear, hear]. What is the state of our Society in regard to our connection with the Royal Commissioners? I am sure our Society has lost ground with the public and with horticulturists, and that with the Commissioners it has also lost ground. We all know and must feel that we have lost ground as to horticulture, and I do think the interests of horticulture have suffered most seriously, my lord, under your administration [loud cheers]. Nothing is more depressing than a walk through your gardens. You have nothing before you but the evidences of blighted hopes and neglected opportunities [hear and laughter]. We actually find weeds springing up in the gardens, and, of course, I need not speak of the destitution which distinguishes the shows of the Society. Well, now, how much easier it is to destroy than to create [hear, hear]. The Wednesday meetings were inaugurated at a great expenditure of time and trouble, and nothing now is so painful as to witness our Wednesday meetings when we compare them with our former Wednesday meetings [applause]. And under these circumstances I ask these gentlemen who are now come upon the Council, and those of the Council who remain upon it, to come forward and prevent this crisis. I beg to say it is our bounden duty to give to the Council now the confidence those retiring have forfeited [hear, hear].

The CHAIRMAN.—The Meeting seems to be under a great misapprehension, and that is that my three friends and myself do not intend to resign. That is, I must say, a very great mistake. There is my resignation, and there are the resignations of my three friends [loud cheers, amid which the noble lord handed the written resignations to the Hon. Secretary]. We are met here to-day to explain why we did not resign before [a laugh].

A FELLOW.—Well, then, as you say that, why did you not resign before? [cheers.]

The CHAIRMAN.—When you are done your talk I will tell you [cries of "oh" and some laughter].

A FELLOW.—I should like to ask if there is any resolution before the Meeting.

The CHAIRMAN.—There are before the Meeting the resignations of myself and my three colleagues [hear, hear].

A FELLOW.—I don't really see what is before the Meeting [interruption]. Several Fellows attempting to address the Chair].

Mr. GURDALLA.—The greatest calamity which can befall the Society is the resignation of you, my lord, and that of your colleagues [cries of "no" and uproar]. You can exercise great influence in dealing with Her Majesty's Commissioners, and your position must have an influence on the way in which the communications of the Council would be received [much interruption]. I directly tell you that if you do not keep these gentlemen in office your Society will be extinct in a very few years [loud cries of "oh" and considerable confusion]. I ask you, Are you aware of the letter of the 25th of May? Are you aware of the letter from Sir Henry Cole to Lord Granville, with respect to the grounds being devoted to building purposes in order to get something from the Government? ["oh, oh"]. Are you aware that was done to bolster-up the failure or the fallen fortunes of the International Exhibitions? [cries of "no," uproar, and interruption]. I beg leave to ask you, my lord, and your honourable colleagues, whether no means can be adopted to have a vote taken? because if there was you would have a large majority [loud uproar and hissing, which lasted a couple of minutes].

A FELLOW.—We come here, not to hear speeches, but to receive the resignations of Lord Bury and three other members of the Council [renewed uproar].

Mr. GURDALLA.—Then I, sir, or my lord [a laugh], as a very old Fellow of the Society, have come here to ask you to reconsider your determination to resign. I not only ask you to do that, but I also ask your honourable colleagues to do the same [interruption]. You have all performed your duties, and conducted the affairs of the Society with great ability [loud and prolonged hissing]. I appeal to you, my lord, as a man who has had much practical experience in public life to reconsider your determination as to your resignation, and to — [The rest of the sentence was lost in the noise resulting from an altercation in the body of the hall, which is explained as follows]. It appears that Mr. Liggins and Mr. Peter Barr of Covent Garden were sitting in close proximity, and during the course of Mr. Guedalla's observations a warm personal altercation between them took place, which, as far as could be heard, assumed the following shape:—

Mr. BARR.—You are a fool, sir, and know nothing about the Society.

Mr. LIGGINS (coming forward towards the platform).—This man calls me a fool! Now, my lord, I am not a fool [great laughter]. I appeal to you, my lord, to protect me against this man's violence. [Looking back], you impudent fellow to call me a fool! [interruption and uproar, during which Mr. Pinches got between and separated the disputants].

The CHAIRMAN.—There is really no question before the Meeting but the one—to consider the conduct of Lord Bury, Sir Coutts Lindsay, Mr. Bonamy Dobree, and Mr. Burnley Hume with respect to the non-completion of their resignations. These resignations are here, but they are not completed.

Lord ALFRED CHURCHILL.—When will they be?

The CHAIRMAN.—Those who called this Meeting have to say. I call upon Lord Alfred Churchill who interrupts me to justify this circular which has been issued. If he does so, and any gentleman has anything to add, I will reply. I place these resignations in the hands of the Assistant Secretary, but they are not yet completed.

Lord ALFRED CHURCHILL.—I quite admit that I signed the requisition referred to by the noble lord. The whole difficulty in which the Society is placed is one of pounds, shillings, and pence [hear, hear]. At present it is in debt some £5000 or £6000. I occupied a seat for a short period at that Council board, and I came there with the wish to help in making terms with Her Majesty's Commissioners. Afterwards there arose great annoyance in the minds of the South Kensington party, and they declined to pass the Report of the Society after terms which we considered beneficial had been made. We assumed that that was a vote of want of confidence, and we retired en masse. You then came into the Society, and you were not in it very long until you were made the catpaw of the party, and from that hour to this the Society has been gradually brought into difficulties, and you have failed to do anything with Her Majesty's Commissioners. I have also been told that when a certain letter from the Commissioners was read in this room your lordship's conduct was so violent that you had to retire [oh, oh]. I hope it is not true. I signed the requisition because I thought it was one which I should sign [hear, hear].

Mr. H. J. VARRON.—On the 4th of June you said you would retire, my lord. I thought it would be for the benefit of the Royal Horticultural Society that your lordship and the other members of Council referred to should retire. You say your

policy has failed and that you could not get the Society along. Well, it has been submitted that the Fellows were not willing to treat with the Commissioners; but, in any case, there can be no doubt we are losing a very great number of Fellows, and that we have alienated from the Society a very great number of exhibitors [hear, hear]. The Royal Horticultural Society has lost a very great deal through not having provincial shows. Something like £1800 or £2000 has been lost through not having provincial shows. Now, with respect to the four gentlemen whose resignations have been handed in, one of them said he should sooner lose his right hand before he would sign a check to pay the prize money to exhibitors. It was the Treasurer who said that, and while on this subject I may say they never had a better supporter of the Society than Mr. Wilkins [hear, hear], and, I do not think he is one who ought to have been spoken of as he has been [hear, hear]. I have heard, too, that the allowance made to Mr. Berkeley, who had worked hard in the interest of the Society, for travelling and other incidental expenses was withdrawn [no, no]. Well, I am glad it was not, for the services of Mr. Berkeley are most valuable. I congratulate Mr. Bonamy Dobree that his right hand is saved and the cheques for the prize money signed, and I have no doubt he has found it much easier to eat his own words than out his right hand off. I am sorry so much should have been said at a previous meeting about the arrangements made between gentlemen and their gardeners in reference to exhibitions. I, as a member of the firm of Messrs. J. Veitch & Sons, have supplied a very large number of gentlemen with gardeners, and in no instance have I known a gardener having less money because of receiving prize money; but I do know cases in which the more prize money a gardener gets the more salary he receives from his master. I do think this is a great Society which in the future ought to drop everything save the study and practice of horticulture. Let them all—horticulturists and South Kensingtonians—pull together to retrieve the fortunes of the Society [cheers].

Capt. MACKENZIE.—I think no one ought to be elected President of the Society who has not a perfect knowledge of horticulture [hear, hear]. I hope that will be borne in mind. With regard to the Royal Commissioners, I am sure they will not put themselves in any way in opposition to the Royal Horticultural Society. I think the gentlemen who signed the requisition ought to get some better man to do the business of the Society [hear, hear].

Mr. SHIRLEY HIBBERD.—I rise, my lord, to move —. [Here there was a good deal of interruption, and Mr. Hibberd sat down without proceeding with his motion.]

Mr. H. G. QUILTER.—You have placed your resignations on the table. You have stated your wish to resign. You have stated the reasons why you wish to do so, but you really have not resigned because you have not completed your resignations. You said as men of honour you would resign, but you deceived us upon that matter.

The CHAIRMAN.—Not at all, we did not.

Mr. QUILTER.—You stated that as men of honour you felt it your duty to resign, but, as men of honour, you have not done so [hear, hear]. I have watched the progress of this concern, and I agree with Lord Alfred Churchill that you have been made the catpaw of a certain party. You neglected the financial means by throwing overboard the Society's provincial shows. I feel it is high time we should do something to place the Society on a sound footing [hear, hear].

The CHAIRMAN.—I would ask the Meeting if the accusation is now completed? If it is, I shall be ready to answer it.

Mr. SHIRLEY HIBBERD.—I rise to move "That Viscount Bury, Sir Coutts Lindsay, Mr. Bonamy Dobree, and Mr. Burnley Hume be requested to complete their resignations" [cheers]. It is not a pleasant thing to have to move such a resolution. We have already many intelligent men on the Council, but I feel bound to remind you that the gentlemen named in my resolution from the moment of their accession to office have been loyally supported ["no," and hear]. I do not think it can be truly alleged that anything like party feeling has entered into the action of the Fellows [hear, hear] in getting up this requisition; but we took your words as the words of gentlemen when you said you would resign [cries of "hear" and "time"]. The gentlemen who have tendered their resignations have no sympathy with horticulture ["time" and "no"]. I take it they have none of it. We were told about the regulations which it is alleged exist between gardeners and their employers.

Mr. LIGGINS said this was not the question they had before them [hear, hear].

Mr. A. F. GODSON.—I will ask whether you, my lord, and those who have given in their resignations are now members of Council or not?

Mr. HIBBERD.—I beg to move the resolution I have read.

Mr. BRAGG (Birmingham).—I will second Mr. Shirley Hibberd's motion. I believe there is a great future for the Society.

A FELLOW.—I don't see it [laughter].

Mr. BRAGG.—I have no animus in the matter—all I have at

heart is the welfare of the Society, and I can only say that if the Council only inaugurates a certain state of things by which the Society could gain the co-operation of large towns like Birmingham, Manchester, Liverpool, and Derby, they will acquire for themselves the best wishes of the horticultural world [hear, hear]. I do hope, my lord, that when you and your colleagues have placed your resignations in the hands of the Council that you will remain in the Society. I believe that hundreds of Fellows in the midland counties will accede to the Society. I beg to second the resolution.

The CHAIRMAN, having stated that Sir Coutts Lindsay was in Scotland, said:—The Meeting will please grant me three words of explanation [hear, hear]. It is true that three of my colleagues and myself said we would resign, and we proposed to resign. At the end of the Meeting Sir Alfred Slade remarked—and I quote from a verbatim report of the Meeting published in the *Journal of Horticulture*—that, according to the 16th bye-law, no business except that for which the adjournment was made could take place. This was what occurred. [He read from the *Journal of Horticulture* of June the 10th of this year:—

"Sir Alfred Slade remarked that, according to the sixteenth bye-law, no business except that for which the adjournment was made could take place. Therefore the Meeting was incapable of accepting the resignation of the members of the Council or to appoint their successors. He regretted very much that there should be any reason for the resignation of the members of the Board who had tendered it.

"The Chairman said Sir Alfred Slade was right. Another Meeting would have to be called to deal with the resignations. That was strictly in accordance with the bye-law which he had quoted. The simple fact was they would have to call another Meeting."

Well, they did not think it right to resign except at a General Meeting. That General Meeting is now called, and our resignations go in. Why did I say our resignations ought not to be taken except at a General Meeting? Because half of the members shall be filled up by the Council and half by the General Meeting. We only announced our intention of resigning at the General Meeting, but when we got to the Council-room we found a list had been prepared in which the four vacancies were to be filled up by certain gentlemen irrefragable in themselves, but not returnable because we thought the whole thing ought to have been referred to a General Meeting. At the Council Meeting of the 7th we had the list, which we refused to vote upon because we felt that the matter should be brought before a General Meeting. When the list of Fellows was proposed I moved the following amendment:—"That although the names submitted are unexceptionable, it is desirable to submit the whole matter for the general discussion of the Society."

LORD ALFRED CHURCHILL.—It was perfectly competent for any twelve members to sign a requisition.

The CHAIRMAN.—No doubt, but I am afraid there was a certain apathy amongst the members of the Society. You cannot expect men to devote their whole attention to the affairs of this Society, and—

MR. W. A. LINDSEY.—Will you allow me to call your attention to the fact that—

The CHAIRMAN (emphatically).—No, do you sit down, sir. If you want to make a speech you can do so afterwards. Now, I will tell the Meeting why we would not resign to the Council. It is because we found it a clique composed of horticulturists [loud cries of "oh," and some uproar]. It may be possible that all sections in the Council will be filled-up by the horticultural section [cries of "hear" and "no"]. I am perfectly willing that every member of the Council shall be a horticulturist, but what we contend is that that shall not be done until the general body of the Fellows shall have carried that into effect. I do not believe that the South Kensingtonians will have confidence in such a Council [cries of "no" and "hear"]. Well, there is a difference of opinion on that point. I deprecate as much as anyone the difference of opinion arising in its extremest form, but in my opinion if some arrangement with the Royal Commissioners is not come to your Society will fall to pieces ["no, no"]. That is my opinion, and I do believe it is my duty to say so. I wash my hands out of the concern with the greatest possible satisfaction. I never attended a Meeting convened in response to a requisition couched in such terms [hear, hear]; and although I am willing to refer it to the clumsiness of those who drew it up, I may say if you get men to serve you on such terms you are extremely lucky [laughter and "oh"]. I see a great many good old friends amongst us, and I should be sorry to part with them except on the best of terms [cheers]. I hope all by-gones will be by-gones [hear, hear], but I do speak my mind when I say you had better take the concern into your own hands instead of having it governed as it now stands. I now place my resignation and that of Sir Coutts Lindsay in the hands of the Secretary in the best good humour, and I take leave of you in harmony and with best good wishes [cheers].

ADMIRAL HORNBY.—I came upon the Council knowing nobody in it, and finding no cliques in it. I have been an active horticulturist for many years; but I believe among the South Kensingtonians there are many good men who have nothing to do with the jealousies and heart-burnings which unhappily

existed, but who have been willing to place the Society on a sure footing without any party feeling whatever. I joined the Council, and it becomes my business to allude with great regret to the relations existing between the horticulturists and the Kensingtonians. It is fair to say what I have already said, that I have not found any feeling of clique on the Council, and I feel certain that members of Council did not say one word they did not firmly believe [hear, hear]. I have come here without any party feeling. I have come upon the Council without having any resolution in my mind, except that of doing the best I could for the Society [hear, hear]. In spite of all that has been said, I believe there is a bright future for the Society, and that we have no reason whatever to despair. I heard at the last Meeting words uttered as to the Royal Commissioners, and I don't know by what authority the word "shuffling" was used towards gentlemen admittedly high-minded. I feel perfectly assured of the good feeling of the Commissioners towards the Society, and I am sure they will meet us in a right and proper spirit [hear, hear]. Notwithstanding many things I have heard as to the condition of the Society, there is not the least reason why this Society should not do well and be really prosperous and well-doing. My only policy is a policy of consolidation. I would point out to the South Kensingtonians how necessary it is to keep these gardens for their own enjoyment, and to the horticulturists how necessary it is to keep these gardens for their own pleasure [hear, hear]. I cannot conceive why, if a wet sponge is rubbed over what is past, we could not resume a position honourable to ourselves and beneficial to the Royal Horticultural Society of England [applause].

MR. BONAMY DOBBER.—As to what Mr. Veitch said about the gardeners, I believe the system referred to is very much adopted. Mr. Wilkins wrote to me to say his gardener would sooner lose £1000 than lose his prizes. This gardener has received about £70 a year for the last four years in prizes, and when the Society was short of funds this very man took an action against us. Rather than that the Society should be placed in such a position, I signed a cheque for the amount claimed [hear, hear]. When I said I should resign it was to the Fellows generally I intended to resign, and not to a clique of the Council. With all respect for the South Kensingtonians, we ought not to be bound hand and foot to those gentlemen who had joined the Society for their own interests.

MR. BURDLAY HUME.—I undertook the position of a member of the Council, not as the nominee of the horticultural or any other party in the Society. I came upon it as the representative of the general Society. I beg to repudiate the idea of being the nominee of any party in the Society. We are charged with being "obstructives," but instead of that being the case we have done what we could to forward the interests of the Society; and we have been called this name because we have failed in our mission and been unable to come to terms with Her Majesty's Commissioners. I think under the circumstances we were justified in saying we would tender our resignations [hear, hear]. We never intended not to pay the prize money, but we were pressed, and the result was we received a back-handed blow, which forced the Council into the County Court. I should like to ask how we can be called "obstructives" when our exertions on the Council have been continually obstructed by matters out of doors? [hear, and "no"]. It was other gentlemen who prevented us from doing what should have been done. Although, technically, I know very well we might tender our resignations to the Council, I think that is better and more satisfactorily done through the medium of a public meeting. I am bound to say the Council has been most loyal to me in every way, and during the time I have served with them I have found every member ready to sacrifice time for the interests of the Society [hear, hear].

MR. W. B. KELLOCK.—We have elected upon the Council Lord Lawrence, Mr. Grote, Admiral Hornby, and Dr. Hogg. Thus you will find that the horticultural party will be well represented on the Council [hear, hear]. The Council consists of fifteen members, and of these eight belong to horticulture [applause].

MR. HENRY LITTLE.—I cannot sit down and hear Lord Bury's accusation without saying a few words. I have attended to the duties of a member of Council, but my feelings have never gone entirely with the horticultural party, but in the direction of the general good of the Society. When I was asked to take a seat at the Council I was told I could be useful. I have sat on the Council, and I say that Lord Bury's policy has been that the South Kensington Gardens should be kept for the South Kensingtonians, and that so far as the horticultural world went it should know nothing about them ["hear" and "no"]. That is not a policy I like. I say it is a policy which is utterly wrong [hear, hear]. What has Lord Bury done? He has nominated four Vice-Presidents. Who are they? Are they not all residents of South Kensington? [hear, hear]. Where the policy of Lord Bury failed has been in giving-up the gardens to the South Kensingtonians, and so long as Lord Bury and the South Kensington element was upon the Council, the Society would

have no chance of being extricated from its difficulties. Less than this I do not think I could say.

Mr. POWELL.—I rise in order to ask this question:—Are we going to rip-up all the proceedings of the Council and discuss what brought about the resignations of these gentlemen? I submit our business now is to deal with the resignations. We ought rather throw oil than oil and vinegar upon the troubled waters [hear and laughter].

Lord ALFRED CHURCHILL.—I beg to move a vote of thanks to Lord Bury and the other gentlemen who have tendered their resignations.

A FELLOW.—You thank them for doing their best, and then deal with them harshly [cries of "no"].

The CHAIRMAN.—All I can say as to a vote of thanks, that I will not accept a vote of thanks in the shape of an insult ["no, no," and "hear, hear"].

Mr. PINCHES.—When Lord Alfred Churchill rose I thought it was upon a point on which we might agree. It is not the fault of those gentlemen who are retiring that they have not been successful. Lord Bury and his colleagues had given a great deal of valuable time to the work of the Society, and for this his lordship had been insulted and abused in the public papers. I think our grateful thanks are due to Lord Bury, Sir Countess Lindsay, Mr. Dobree, and Mr. Hume for their efforts to promote the prosperity of the Society [hear, hear].

Mr. GUNDELLA seconded the resolution, which was carried, and the protracted proceedings were then brought to a close.

## RICHMOND HORTICULTURAL SOCIETY.

JULY 8TH.

As the first Show of a new Society we are glad to note the Exhibition a great success. The district is good, the patronage distinguished and influential, the Committee practical, and the Hon. Sec., Mr. Chancelor, indefatigable. The site—the old Deer Park—is also admirably suited for a horticultural gathering. These are elements that can hardly fail to ensure the continued success of a Society which is now thoroughly established. The schedule was well arranged, the prizes liberal, and the classes were well filled. Messrs. Jackson & Sons were successful with their fine specimen plants; Mr. Legge, Clapham Park, with his splendidly grown fine-foliaged plants; and Mr. Murrell, Camberwell Park, with Ferns and Calceolarias. The groups of plants arranged for effect were an attractive feature of the Show. Messrs. Jackson & Sons, Mr. Kinghorn, and Mr. Atrill, gardener to G. J. Frenke, Esq., were the successful competitors. Fuchsias and Pelargoniums were very fine from Mr. James and Mr. Atrill.

In the miscellaneous classes Messrs. Veitch & Sons had an extra award for a beautiful collection of plants, as had also Messrs. Jackson & Sons, Mr. Dean, Mr. Kinghorn, Mr. Charnaborn, and Mr. Herbst. Mr. Young, East Sheen, had a special award for splendidly grown Calceolarias. Mr. Turner, Slough, was to the front with Roses. Mr. James, Mr. Moorman, Mr. Cranter, and Mr. Ellis were also successful exhibitors of Roses. For glasses of flowers and bouquets Miss Kinghorn, Miss Letham, Miss MacKinnon, and Messrs. Dobson & Sons were successful exhibitors.

Of Fruit there was a good display, especially the collections from Mr. Wagstaff, gardener to T. H. Fairleigh, Esq., and Mr. Cornhill, gardener to J. S. Virtue, Esq. Mr. Pepper, Mr. Fanning, and Mr. James were also successful exhibitors. Grapes, Melons, Peaches, Cherries, and Strawberries were all well represented. Vegetables were also very good, the principal prize being a silver cup offered by Messrs. James Carter & Co., and won by Mr. James, gardener to G. F. Watson, Esq., Isleworth. Altogether the Exhibition was such as to afford gratification to the visitors and encouragement to the promoters.

## A LEASH OF FLOWER SHOWS.

WISBECH, SPALDING, AND TUNBRIDGE WELLS.

WHAT a time for flower shows we have had lately, and how it must have tried the nerves, and pockets too, of many a Society. The Royal Botanic, Birmingham, Hereford, Chislehurst, Wisbech, Spalding, Tunbridge Wells, and many others selected it for their annual gathering; and as morning after morning opened with its portentous-looking black clouds, and as the rain, sometimes in drizzling mist, at other times in perfect torrents, descended, how many must have felt that the fate of the Societies they were interested in was trembling in the balance! It required courage of no mean order to bear up under these trying circumstances, but in the two instances at which I was present I saw no symptoms of despair, but a steady determination to make the best of bad circumstances and to put a good face on the matter. It was so at Wisbech and at Spalding. Tunbridge Wells was favoured with a perfect day and a large gathering of people, and a great success must have been the result. Let me now record a few notes in connection with the three Shows above named, at which I was present.

WISBECH ought to be dear to all lovers of the Rose, for here

first were those large prizes offered which have been followed in other places, and which have tended in no slight degree to make more popular still the queen of flowers. It is favoured, too, in possessing in Mr. Baker of Colville House one of those public-spirited men whom nothing will daunt, and who carries out all he undertakes with the energy and pluck which are the distinguishing characteristics of the Englishman. He throws open his grounds for the purpose of holding the Show, and indeed I may say throws open his house also, where a large-handed hospitality is shown. Notwithstanding the counter-attraction of Birmingham, which doubtless carried off such competitors as Paul & Son, Tarnor, and Cranston, the All-England prizes of £10, £7, and £5 were ably contested by Messrs. Keynes, Cant, and Prince, and taken in the order named. I begin to think that it is quite useless to enumerate the varieties in each winning stand. I daresay I could name beforehand without much difficulty thirty-six out of the forty-eight which were to be seen in each stand, for what stand can do without Charles Lefebvre, John Hopper, Alfred Colomb, Marie Baumann, and other well-known Roses? Suffice it to say, then, that Mr. Keynes's stand exhibited that finish for which his flowers are always remarkable, and they combined size with finish, which is not often the case. Mr. Cant's flowers were also very fine, especially his Teas and Noisettes. Who can exhibit *La Bonne d'Or* as he does? while Mr. Prince's from the seedling Brier were very fine. Indeed these three stands ran very closely one on the other. Prizes of £7 for twenty-four Roses and £5 for twelve will show the liberal character of the schedule, and I have no doubt but for the Birmingham and Royal Botanic being on the same day there would have been a larger competition. The class for twelve blooms of any one Rose and that for twelve new Roses did not bring out any remarkable competition, Miss La Baronne de Rothschild being set up by two exhibitors, but with inferior blooms.

Liberal prizes for stove and greenhouse plants and exotic Ferns brought together some fine collections, of which the most noticeable were those of Mr. Cypher of Cheltenham, Mr. House of Peterborough, and Mr. Dixon of Beverley. There were amongst them some really grand plants, which would not have been out of place in any of our metropolitan shows.

Table Decorations were pretty, showing that the correct taste in such matters is rapidly extending, and that we have nearly left behind those heavy monstrosities which used at one time to be considered *en règle*. I shall have, however, more to say on this subject in my notes on the Tunbridge Wells Exhibition, where they were largely shown.

The only classes which were indifferently filled were those for Pelargoniums, and I cannot but think that an alteration in the schedule as to these would be desirable. The cottagers' classes were well filled, and showed that there is in these districts a strong spirit of emulation which cannot but be helpful to the well-being of the labouring poor.

SPALDING.—As this was held the day after Wisbech many of the fine plants exhibited there, notably the specimens of Messrs. Cypher, House, and Dixon, found their way here, while to them were superadded a large number of most excellent plants from the neighbourhood. The Pelargoniums and other plants exhibited by Mr. G. F. Barrett showed that good culture may be as confidently looked for in the provinces as around the metropolis. And let me say that I have never seen near London a finer collection of herbaceous plants than those exhibited by Dr. Stiles; and as they were to my mind one of the most distinguishing features of the Show I shall dwell a little on them, more especially as I had the opportunity of seeing their home. Dr. Stiles's garden is an instance of how *amor vincit omnia*; for in a small piece at the back of his house, no way different in size or character from those "bricklayers' gardens" which abound in all towns, he has managed to collect some of the rarest and best of hardy plants; and those who maintain that an herbaceous garden must always be rubbishy would find how erroneous this was, for Dr. Stiles's garden is a model of neatness. The twelve plants which took first prize comprised excellent examples of the following—*Equisetum sylvaticum* (nothing could be more graceful than this common British plant; grown as it had been, standing in water and shaded, it would make an admirable table plant); *Baptisium salicifolium* with large yellow flowers; *Campanula persicifolia* alba; *Campanula cordata*; *Lychnis Haageana* (admirably done); *Spiraea alpendula*; *Delphinium Beauty of Perouse*; *Campanula Van Houttei*; *Dianthus barbatus magnificus* (Mr. Ware's very beautiful double Sweet William). In the other collections and in the boxes of cut blooms I noticed *Campanula carpatia* bicolor; *Spiraea areolaris*; *Epilobium angustifolium* album; *Geum lanceolatum*; *Oenanthe caerulea*; *Geum obovatum* flore pleno; *Aquilegia chrysantha* (very beautiful); *Glaucidium Colvilli*, &c. Altogether the herbaceous plants were a great feature of the Show. Referring again to the plants, Mr. Cypher had *Ixora amabilis*, *Clorodendron Belfourianum*, *Allamanda grandiflora*, *Phoradendron proflera*, *Dipladenia insignis*. In Ferns Mr. Cypher had fine examples of *Adiantum Farleyense*, *Gleichenia dicarpa* and *spelonaea*, *Davallia Mooreana*, *Oclobium*

princeps, *Gymnogramma peruviana argyrophylla*. Mr. House and Mr. Dixon had also fine collections.

I see many flower shows and know a good deal of their management, but I knew no place where a more perfect method of management is adopted. Gentlemen are told off for the various duties, even to the minutest details. "What's everybody's business is nobody's business" finds no place here, and the result is all goes without a hitch. No one who knows Spalding will need to be told that a kind and genial hospitality is one of their characteristics. To this I at least can bear witness.

TUNBRIDGE WELLS.—Unlike the two preceding Shows, The Wells (as it is locally called) was favoured with a lovely day. The Show ground is close to the station; and on such a day as this the tents pitched in the rising ground, and the crowds which throng this fashionable watering place, made a gay and brilliant scene. There were many plants of rare excellence. I do not think, for example, I ever saw so fine a collection of *Crotons* as those exhibited here. They were old kinds, but grandly grown. The *Achimenes*, *Gloxinias*, and *Lycopods* were exceedingly well done, but in my opinion the chief features of the Exhibition were the cottagers' productions and the table decorations. Of the former it is impossible to speak too highly. The very best stand of twelve *Roses* in the whole Exhibition was to be found here, while the *Strawberries* were marvellously fine. In the table decorations Mrs. Seale of Sevenoaks displayed great taste in her arrangement, the white *Water Lilies*, *Forget-me-nots*, and *Anturium* forming a beautiful combination, although perhaps there was a little too much of the latter. Many very beautiful vases of wild flowers were shown, and the large room in which they were shown was the centre of attraction, to ladies especially, throughout the day. The arrangements here, under the able direction of Mr. Sorby, seemed admirable. And so ends my week of flower shows.—D., Deal.

### "A SCARBOROUGH WARNING."

Very few of your south-county readers will know what meaning is in that Yorkshire proverb, nor did I until a slap on the shoulder, accompanied by "There's a Scarborough warning for you," made me seek for its explanation. During Wyatt's insurrection in 1553 some of his partisans disguised as countrymen were admitted into the castle, and its garrison was overpowered first, and then told who were their captors. So "A Scarborough warning" is synonymous to the more widely-known proverb expressive of a surprise—"A word and a blow, but the blow came first."

Now, the first "Scarborough warning" I had was at York, where I was conveyed to the most comfortable hostel—comfortable from the first greeting until at the end of three days I bade farewell to my host. That hostel and host were the Black Swan and John Penrose. The first of that name of whom I have met a record was Simon de Penrose—that is, Simon living on the hill meadow, and like my host delighting in country occupations. Penrose de Oygno Nigro, or of the Black Swan, is a lover of gardening, and he evinces that love worthily. I marvelled to see all passers-by stop and look in at one of the windows, but I ceased marvelling when I passed that window and saw its tasteful decoration with flowers. They were arranged in a row of small bouquets, surmounted by a larger and high central group, arched over by a wreath, and the whole was as demonstrative of good taste in which the colours of the flowers and the foliage were harmonised as that good taste was shown in the form of the arrangement.

Then Mr. Penrose has a large garden, and is one of the Directors of the Garden and Museum of the Philosophical Society. The floral planting of that garden savours of the same guiding, and aided by the very striking variations of the surface, and its intermingling with the ruins of St. Mary's Abbey, a beauty has been attained scarcely attainable elsewhere. Those monks well understood how to combine the beautiful with the useful. The site of the Abbot's garden, like that of the Abbey, is near the river, and thus were fish and some vegetable food provided. I say "some," because every monastic establishment had farms paying their rents, in part or entire, in provisions. Thus, the Oisterian Monastery at Scarborough from its farm in the manor of Peaseholm received poultry, butter, milk, and other provisions, among which would be ducks that monks occasionally are said to have eaten on days when meat was forbidden, assigning as their justification that ducks live partly in the water, and therefore partake of the nature of fish. Let monks be condemned and ridiculed as they are, yet were they the greatest benefactors of their age; they read and wrote in the times when no nobleman could sign his name, and they were the only schoolmasters of those days; and one of the, to me, most interest-

ing reliques in the Museum of the Yorkshire Philosophical Society are two glazed tiles found in the quadrangle where the monks of St. Mary held their school, on which tiles are painted the alphabet in capital letters of the fifteenth century. Those Oisterians had eighty-five religious establishments in England, the Dominicans had forty-three, and the Carmelites forty; the Franciscans had probably as many, so that there were about two hundred of these institutions imparting and encouraging learning and the culture of the soil throughout our country. This is no mere surmise, for Dr. Walker describes the remains of an orchard in one of the Hebrides that belonged to the monastery of St. Colomb as early as the sixth century.

One note more about this neighbourhood, and then I will away to another "warning." Who that ever read in childhood that best of childhood's books "Evenings at Home" forgets the tale of "Eyes and No Eyes?" On the sands before me is an illustration of that tale. Down to 1620 Scarborough was noted for nothing but being a nest of fishermen; but in that year a Mrs. Fowler, to whom the Scarboroughians ought to erect a memorial, observed when walking along the shore a streamlet which imparted a reddish tinge to the pebbles over which it trickled. She tasted the water; it was slightly acid; she dropped it into tincture of galls, which it purpled; she drank of it; found it was medicinal; and in a few years it became a fashionable resort. Mrs. Fowler was one of that section of the community who have "eyes" and use them thoughtfully.

Beneath a cloudless sky, and with a fresh breeze keeping me cool, I passed by Carnelian Bay and Gristhorp without staying to search for the pebbles of the first, or to examine the tumuli of the other. In the latter were found the remains of a warrior, adding strength to the evidence that Filey, whither I was journeying, was the Roman station and "well-havened bay" noted by Ptolemy.

"A Scarborough warning" at length brought me to a standstill, for beside a gateway was raised a board inscribed "Bellwood's Fruit Gardens." Their proprietor and cultivator was in view, so I hailed him with, "Have you any British Queens?" "No, but I have a better kind." "Then I will buy your whole stock of plants." This led to the explanation that the variety he lauded was President, and what Mr. Bellwood meant was that they are "better" on his ground, for on it neither British Queen nor Dr. Hogg, nor some others, are good croppers. The berries of President were certainly fine both in size and flavour, and the bushes of Gooseberries and the canes of Raspberries were loaded with fruit. The Potatoes of all kinds were perfectly healthy, and above all in vigour was the Lapstone, which Mr. Bellwood briefly and justly characterised as "the best of all the Potatoes." He has two gardens, each of about two acres, and I recommend every sojourner in this neighbourhood to visit them if they covet a quart of first-rate Strawberries for a shilling, and a large bouquet of *Roses* for sixpence.—G.

### BUTTON-HOLE ROSES.

I AM surprised that no mention has been made of Safrano and Madame Melanie Willermoz; the latter is most perfect. In the article on Tea Roses (page 3), the latter is surely not correctly described. With me it is of an extremely beautiful shade of pale lemon, darker in the centre. It is most beautiful when in bud, and still beautiful when open from its exquisite shading.

How anyone can recommend Gloire de Dijon and Maréchal Niel for button-holes I cannot understand, for, as your correspondent "P." says of some other *Roses*, you might as well wear a full-expanded Paul Neron.

Might I suggest to your numerous correspondents that in giving their experience on different plants they should at least give the county from which they write? otherwise their experience is apt to mislead many others who live in a completely different climate.—H., Ayrshire.

### A WILD GARDEN.

In one of my rambles in an upland district some 700 feet above the sea, turning aside into what had been at some time a quarry, and passing by it, I came to a bank on the hillside, and to my surprise I found one of the most beautiful native gardens that I ever looked on, and what interested me was, it was purely natural, no art had laid a tool upon it. I noted down what plants were in bloom in this charming spot. The

space was some 70 or 80 yards long; and as some of our readers may be interested in our native flowers, many of which are worthy of cultivation, though we often pass them by without any concern, I mention the following as what I noted in the space above named:—

*Sedum acre*, *Centaurea nigra*, *Draba verna*, *Dactylis glomerata*, *Fedia olitoria*, *Poa trivialis*, *Pimpinella Saxifraga*, *Thymus serpyllum*, *Galium pusillum*, *Plantago lanceolata*, *Arenaria serpyllifolium*, *Galium rubrum*, *Capsella Bursa-pastoris*, *Anthoxanthum odoratum*, *Avena pubescens*, *Hieracium pilosella*, *Arabis hirsutus*, *Oratagus Oxycantha*, *Tenorium Scordonia*, *Polygala vulgaris*, *Lotus corniculatus*, *Geranium Robertianum*, *Rumex Acetosella*, *Bellis perennis*, *Epilobium montanum*, *Geranium lucidum*, *Galium aparine*, *Plantago major*, *Rosa canina*, *Cnicus lanceolatus*, *Ranunculus acris*, *Trifolium pratense*, *Leontodon Taraxacum*, *Holcus lanatus*, *Trifolium repens*, *Festuca pratensis*, *Anthriscus vulgaris*, *Veronica arvensis*, *Olinopodium vulgare*, *Alechmilla alpina*, *Poa annua*, *Trifolium medium*, *Bromus mollis*, *Galium cruciatum*, *Vicia sepium*, *Phleum pratense*, *Myosotis arvensis*, *Veronica chamaedrys*, *Hieracium boreale*, *Rumex pratensis*, *Beseda luteola*, *Sisymbrium officinalis*, *Sonchus oleraceus*, *Achillea Millefolium*, *Urtica dioica*, *Geranium molle*, *Rumex acetosa*, *Crepis tectorum*, *Briza media*, *Scabiosa Columbaria*, *Hieracium Sphondylium*, *Campanula rotundifolia*, *Cardamine hirsuta*, *Asplenium Ruta-muraria*, *Lathyrus pratensis*, *Lamium album*, *Scabiosa succisa*, *Glyceria rigida*, *Vaccinium Vitis-Idæa*, *Hellanthemum vulgare*, *Cynosurus cristatus*, and *Vicia sepium*.—OBSERVER.

### AMERICAN BUG OR BLIGHT.

HAVING derived some little experience in trying to exterminate or even reduce the above pest from over a score of standard Apples I found in my garden on coming here three years ago, I shall be very glad if these remarks may lead to further ventilation of the subject with a view to elicit, if possible, through the columns of your valuable Journal some surer mode than I think now exists to eradicate this pest from this class of fruit trees.

I found my trees almost white over with the bug; and being much overgrown from neglect, I commenced heavy pruning in August with a view to develop fruit and form, burning all the cuttings, following this by thoroughly washing each tree with warm soft soap and water, and later in the winter dressing all the old wood with paraffin oil. Last year on the first appearance of the enemy in spring I applied the soap solution mixed with Glahurst compound sufficiently frequent to keep the bug moderately in check, repeating the oil again towards winter. So far this year I have adopted the same plan, though still with all the attention I can afford I consider myself far from having succeeded, since, though I have a very fair showing of fruit, were the trees left to themselves one month they would most certainly be as I found them at the beginning.—AGRICOLA, Liverpool.

### OUR BORDER FLOWERS—DOG'S-TOOTH VIOLETS.

In our eager pursuit of the more gorgeous forms that the floral world affords us for decorative purposes do we not sometimes overlook some of the lowly flowers of hardy nature? Two hundred and more years, if report be true, has been added to the world's history since *Erythronium Dens-canis* found its way to our shores. How in those days it might be treated I have no means to ascertain; at all events we know that it has remained with us, and now enjoys a very prominent place in the spring garden and borders where those kind of plants are cared for. Sometimes we see them thrust into a corner or more than half hid by some intruding evergreen or shrub, and, what is worse, in some instances left to chance, eventually disappear, and then we wonder why they do not flourish with us.

I fear there are very few species found in general cultivation. • There is something very attractive about their beautifully spotted leaves, to say nothing of their charming flowers in early spring, when of all times during the year flowers are looked on with such delight. They will thrive in most places if they have light and air, and they can be turned to good account in many ways: they are equally interesting in bed, border, rockery, or pot. They like a moderate share of moisture, but should have thorough drainage; they do well in a compost of good friable loam and sandy peat in equal parts, a

little leaf mould, with a little sand or charcoal dust added. When established the less they are disturbed the better. When left in the ground the place should be well marked, or they are liable to be destroyed. They are increased by division, which is best done when growth has been matured. There are three or four shades of colour. When grown together they have a very pleasing effect in early spring. *Erythronium americanum* is very desirable, its yellow flowers contrasting with *E. Dens-canis* and *E. Dens-canis album* and *purpureum*. The foregoing are most commonly met with in cultivation. There are other kinds—as *E. giganteum* and *E. longifolium*—that ought to be more frequently met with, and which only require to be known and seen to be appreciated.

This is one of the most interesting families of early spring-blooming plants we possess, and worthy of very extensive cultivation.—VERITAS.

### THE POTATO DISEASE.

THE following interesting paper by Mr. Worthington G. Smith, on the disease affecting the Potato, was read at the meeting of the Royal Horticultural Society on Wednesday, the 7th inst. :—

#### THE RESTING-SPORES OF THE POTATO DISEASE.

The Potato disease in this country is rarely seen before the month of July, but this year I received some infected leaves for examination from the Editors of the *Journal of Horticulture* at the beginning of June, and my reply to the correspondent was printed on June 10th. The leaves were badly diseased, and I detected the *Peronospora* in very small quantities here and there, emerging from the breathing pores. This was a week or ten days before Mr. Berkeley brought the matter before the Scientific Committee of the Royal Horticultural Society (see *ante*, vol. i., 1875, p. 795), and when I heard Mr. Berkeley's remarks about the *Protomyces*, I immediately accused myself of great carelessness in possibly overlooking it; but I was equally certain of the presence of the *Peronospora* in the specimens I examined.

On receiving authentic specimens of diseased plants from Mr. Barron of Chiswick, the brown spots on the Potato leaves at once reminded me of the fungus of some species of *Protomyces*, and the dimensions agreed tolerably well with some described plants of that genus, but the spots when seen under a high power appeared very unlike any fungus, and they were very sparingly mixed with other bodies much smaller in diameter, and with a greater external resemblance to true fungus spores. These latter spore-like bodies were of two sizes—one transparent and of exactly the same size as the cells of the leaf (and therefore very easily overlooked), and the other dark, reticulated, and much smaller. A few mycelial threads might be seen winding amongst the cellular tissue, and these threads led me to the conclusion that the thickened and discoloured spots were caused by the corrosive action of the mycelium, in the same way as Peach, Almond, Walnut, and other leaves are thickened, blistered, and discoloured by the spawn of the *Ascomyces*, as illustrated at the last meeting of the Society.

My opinion, therefore, was soon formed that the "new" Potato disease (as it has been called) was no other than the old enemy in disguise, or, in other words, that it was the old *Peronospora infestans* in an unusual and excited condition. That climatic conditions had thrown the growth of this fungus forward and out of season was probable; but the idea that the pest would not at length attack all and every sort of Potato was to me most unreasonable, though the more tender sorts might be the first to suffer.

Suspecting the two-sized small bodies before mentioned to be of the nature of spores, and remembering my experiments during last autumn with ketchup, in which I observed that the spores of the common Mushroom might be boiled several times, and for lengthened periods, without their collapsing or bursting, I thought I would try to set free the presumed spores of the Potato leaves by macerating the foliage, stems, and tubers in cold water. This maceration was necessary because the tissue of the diseased leaves was so opaque and corroded, and the cell-walls were so thickened, that it was difficult to distinguish the threads and suspected spores from the cellular tissue. I did not treat the leaves with boiling water, because I wished to keep the threads and spores alive.

From day to day I kept the diseased leaves and stems and tubers wet between pieces of very wet calico, in plates under glass, and I immediately noticed that the continued moisture greatly excited the growth of the mycelial threads; this to me was quite unexpected, as I had merely wished to set the spore-like bodies free. So rapid was now the growth of this mycelium that after a week had elapsed some decayed parts of the lamina of the leaf were traversed in every direction by the spawn. Thinking the close observation of this mycelium in the now thoroughly rotten and decomposed leaves might end in some

addition to our knowledge of *Peronospora infestans*, to which fungus I had no doubt from the beginning that the threads belonged, I kept it under close observation, and in about ten days the mycelium produced a tolerably abundant crop, especially in the abortive tubers of the two-sized bodies I had previously seen and measured in the fresh leaves. The reason why these objects, which undoubtedly occur in and about the spots, are so extremely few in number in those positions is, I imagine, because they require a different set of conditions for their normal growth, and these conditions are found in abundant and continued moisture.

The larger of these bodies, the measurements of which I shall give, with a woodcut illustration, in an early number of the *Gardeners' Chronicle*, I am disposed to consider the "oospore" of the Potato fungus, and the smaller bodies I look upon as the "antheridia" of the same fungus, which are often terminal in position. The filaments of the latter are commonly much articulated, and sometimes more or less moniliform or necklace-like. Both oospore and antheridium are very similar in nature and size to those described as belonging to *Peronospora alismarum* and *P. umbelliferum*, and this is another reason (beyond my seeing undoubted *P. infestans* on Potato leaves at the beginning of June) why I am disposed to look upon these bodies as the oospore and antheridium of the Potato fungus.

The larger bodies are at first transparent, thin, pale brown, furnished with a thick dark outer wall, and filled with granules; at length a number (usually three) of vacuities or nuclei appear. The smaller bodies are darker in colour, and the external coat is marked with a few reticulations, possibly owing to the collapsing of the outer wall. At present I have been unable to detect any fecundating tube (described as belonging to the antheridium of other species of *Peronospora*), but I have observed the two bodies in contact in several instances. After fertilisation has taken place the outer coat of the oospore enlarges, and appears to be cast off. Both antheridium and resting-spore are so slightly articulated to the threads on which they are borne, that they are detached by the slightest touch, but with a little care it is not really difficult to see both bodies *in situ*, and my observations lead me to think that conjugation frequently takes place after both organs are quite free. The antheridia and oospores are best seen in the wettest and most thoroughly decomposed portions of the tissue of the decomposing tuber, but they occur also in both the stem and leaf. I consider Mr. Alexander Dean's remark, as reported in *Gardeners' Chronicle* for June 19th last, page 795, to have a distinct bearing on this point, where he says, "In all cases where the seed tubers were cut they were quite rotten."

Before I referred to De Bary's measurements of similar organs in other species of *Peronospora* I was disappointed with the results of my observations, and felt disposed to refer the bodies and threads in the Potato leaves to *Saprolegnia*, but a glance at the figures which I shall shortly publish, and the similar figures copied from De Bary to the same scale, will show that if the bodies observed by me are *Saprolegnia*-like, the oospores and antheridia figured by De Bary show an exactly similar alliance. Still, as the *Saprolegniæ* are at present defined, I am by no means inclined to describe the bodies observed by me as really belonging to that tribe of plants.

The *Saprolegniæ* have the habit of moulds and the fructification of Algae; and they live on organic matter, animal and vegetable, in a state of putrefaction in water. One of the best known of these plants is *Botrytis Bassiana*, the parasite which causes the disease of silkworms. Now the genus *Botrytis* amongst fungi is almost or quite the same with *Peronospora*, to which the Potato disease belongs; and I consider it a strong argument in favour of my *Saprolegnia*-like bodies being the oospores and antheridia of the *Peronospora* when such an authority as Mr. Berkeley ("Micrographic Dictionary," p. 6) considers one of the *Saprolegniæ* (*Achlya*) "may be an aquatic form of *Botrytis Bassiana*"—the silkworm disease.

The common fungus which attacks flies (so frequently seen on our window-panes in autumn), *Sporendonema muscæ*, Fr., is said to be a terrestrial condition of *Saprolegnia ferax*, Kütz., which latter only grows in water; and if a fly infected with the fungus be submerged the growth of the *Saprolegnia* is the result. It would now seem to be somewhat the same with the Potato when diseased, in the fact that when submerged a second form of fruit is produced.

Between the two moulds *Botrytis* and *Peronospora* there is little or no difference; the characters of Corda, founded upon the continuous or articulate filaments, cannot be relied upon, and even De Bary himself figures *P. infestans* with articulate filaments like a true *Botrytis*. The intimate connection, however, between the *Saprolegniæ* and some moulds cannot be denied, as the instances above cited clearly show; and I am therefore disposed to think that the fungus which produces the Potato disease is aquatic in one stage of its existence, and in that stage the resting-spores are formed.

Reference should here be made to the bodies found germinating in the intercellular passages of spent Potatoes by Dr. Mon-

tagne (*Artotrogus*), and referred by Mr. Berkeley to the *Sepedoniæ*. Ever since Mr. Berkeley first saw these bodies he has had an unswerving faith in the probability of their being the secondary form of fruit of *Peronospora infestans*, but, unfortunately, as far as I know, no one has ever found a specimen of *Artotrogus* since Montagne.

The question may, therefore, be naturally asked in conclusion—How does *Artotrogus* agree with the presumed resting-spores here figured and described? And has Mr. Berkeley been right or wrong in clinging so tenaciously to his first idea? Fortunately for the investigation of the Potato disease (which can never be cured till it is understood), Mr. Berkeley has given in the *Journal of the Royal Horticultural Society* the number of diameters his figures are magnified to, and I have here further enlarged those figures so as to correspond in scale with my own drawings, which latter are sketched with a camera lucida. It will be seen that they are the same with each other both in size and habit, with the exception of the processes on the mature spore of *Artotrogus*—which processes may possibly be mere mycelial threads, or due to the collapsing of the inflated epispor. The reason these resting-spores have evaded previous search is that no one has thought of finding them amongst leaves which had been macerated for a long period in water. There is, however, nothing unreasonable in fruit being perfected in water or very damp places, as it is common in the *Saprolegniæ*, and amongst Algae in general. To sum up, there are four reasons why the bodies here described belong to the old Potato disease:—

1. Because they are found associated with the *Peronospora* and upon the Potato plant itself.

2. Because they agree in size and character with the known resting-spores of other species of *Peronospora*.

3. Because some other moulds are aquatic in one stage of their existence.

4. Because they agree in size with *Artotrogus*.

I will only say in conclusion that it affords me great pleasure to lay these additional notes on the Potato disease before the Society which thirty years ago published Mr. Berkeley's original and excellent memoir on the same subject.

### THE QUALITY OF PEAS.

How is it that with a fine Pea season like the present one, and the market overflowing, and hard small Peas almost going a-begging, that it is so difficult to purchase a dish of really delicious Peas? Is it that raisers of Peas are paying too much regard to mere colour of pod and size? Colour is very tempting, and growers like to treat the public to a deep green-podded Pea; but such are not the best. Prizetaker, for instance, is fine to look at, but not good to eat.

When varieties of Peas were less numerous the market quality was better than now. Where is the old Early May? None of the early round Peas are equal to it, and none of them a week earlier. When that, Champion of England, and Hair's Dwarf Marrow were the staple sorts, we were certain of good Peas at every dealer's, but it is not so now. Such Peas always commanded a sale, and in my opinion would do so now.

Being neither a grower nor a seller, but a consumer, I am, perhaps, somewhat behind the fashion of the day in asking, not for grand Peas to look at, but sweet and delicious Peas to eat. Am I singular and alone?—A CITY MAN.

### FIOUS REPENS MINIMUS.

For clothing the wall of a stove or intermediate house with close green foliage the above plant is particularly suitable. It is brighter in colour than *F. repens*, and its foliage is not more than half the size of the old species, the separate leaves not being more than a quarter to half an inch in diameter. It is impossible to imagine anything clinging more closely to a wall than does this plant; in fact, it covers completely any surface and still takes up scarcely any room. It clings with the persistency of Ivy, and yet does not project from the wall half an inch. I saw it the other day in Mr. Kinghorn's nursery at East Sheen, covering the brickwork of the ends of a plant stove. For rockeries under glass, or the covering of walls of any kind, this plant is pre-eminently suitable, and can be turned to good account in surfacing knolls, boulders, and other adjuncts of the fernery. It will possibly flourish in a greenhouse temperature, for we observed where the plant had pushed itself through the seams of the brickwork that it was as healthy on the outer wall as within the house, but that of course was only the growth of the current summer. This is a distinct plant for a distinct purpose, and for that purpose—the imparting to surfaces a living green covering as close as if glued there—it is unequalled. Those seeking for a carpet plant to completely hide bare walls or other surfaces, and which re-

quires no tacking nor tying, cannot do better than try this *Picus*, which is probably a miniature and distinct form of *F. repens*.—W.

### SOLANDRA GRANDIFLORA.

This belongs to a splendid genus of plants named in honour of Daniel Charles Solander, LL.D., a Swedish botanist of great celebrity. He was the companion of the renowned Sir Joseph Banks in the memorable voyage of discovery round the world, and was the collector of the botanical notes made during that expedition, and which are now preserved in the British Museum. The plant, a bloom of which we figure, is by no means commonly to be met with in cultivation. This is not, however, because it is not beautiful, but rather that it is somewhat shy in producing its flowers. Besides the flowers being strikingly attractive by their *Brugmansia*-like form and pale yellow colour, the foliage is also agreeable, and the plant is worthy of being cultivated in our stoves. For a number of years after its introduction in 1781 this plant did not bloom. It was propagated and grew luxuriantly. The treatment necessary for the production of flowers was found out by accident, a plant being overlooked and left in a dry stove at Kew. This plant produced foliage of only moderate luxuriance, and produced a flower at the extremity of every shoot. This suggested that a period of rest was necessary, and on its being afforded the difficulty in blooming this plant vanished. The plant is propagated from cuttings, which should be grown on in loam and peat in a brisk heat and with liberal supplies of water until it has attained a good size. Water should then be gradually withheld until the leaves wither and drop off by drought, and the plant will seldom refuse to flower profusely. It is a free-growing plant and a native of Jamaica, thus requiring heat to grow it, yet a distinct season of drought and rest to induce the production of its beautiful flowers.

### THE CRACKING OF FRUITS.

This arises from different causes. In Grapes and Melons it is generally the result of an excessive influx of sap after a period of comparative drought—that is, when the autumn rains set in in the one case, and when the roots penetrate into the rotted dung of the hotbed in the other. In both cases the

remedy is in checking the sap by an incision of the stem of the fruit.

Pears crack, first as the result of spring frosts injuring the fruit in its infancy, and is then incurable and mostly unpreventable; and second by drought. This is preventable if water is provided, and time to apply it freely. With a pair of *Clifton des Carmes* Pear trees I have tried experiments with watering—soaking one tree thoroughly, and not giving a drop to the other. I have done this for some years, first with one and then with the other. Except when spring frosts have injured both by superinducing cracking, the watered tree has invariably given the largest, most juicy, and smooth fruit, that on the other tree being more or less cracked. The power of free watering in preventing the cracking of the fruit has been very striking.

Do not many of our fruit trees on a substratum of chalk, gravel, or limestone suffer by lack of a sufficient water supply in the hot summer months?—A NEW SUBSCRIBER.

FLOWER-SEED FARMING.—The large acreage devoted to this purpose by Messrs. Gair of High Holborn, in connection with their vegetable and farmseed crops, at the present time afford a delightful sight. A passing glimpse is obtained just after leaving Manningtree station on the Great Eastern Railway; but it is only the visitor to the Dedham and St. Oayth farms that can fully realise the beauties presented by the broad acres in every possible shade of colour of *Convolvulus*, *Lupinus*, *Sweet Peas*, *Nasturtiums*, *Lobelias*, *Clarkias*, *Larkspurs* (*Delphiniums*), and the like blazing under a July sun—cultivated under the skilful management of Mr. Dunnett, one of the principals. This is a rich and extensive

Fig. 7.—*SOLANDRA GRANDIFLORA*.

display, and is well worthy of a visit by all lovers of popular flowers.

### KNOTT'S GREEN, LEYTON,

THE RESIDENCE OF J. G. BARCLAY, ESQ.

This is one of the largest and best-kept places in the neighbourhood of London, and it is quite suburban, being situated in the Lea Bridge Road, about a mile from Lea Bridge station on the Great Eastern Railway—just outside the dust and turmoil of the great city. The head gardener is Mr. D. Donald, well known to fame as an exhibitor at the metropolitan exhibitions. At the time when the fine collection of stove and greenhouse plants formed by the late Mrs. Lawrence of Ealing

Park was dispersed, and when Mr. John Fraser of the Lea Bridge Road Nurseries also had a collection that invariably placed his name at the head of the prize list, Mr. Donald was working steadily in the same direction, and his stove and greenhouse flowering plants were always in a high position.

I well remember—it must be more than a dozen years ago—admiring for the first time a splendid plant of *Clerodendron Thomsonii* in his collection at Regent's Park, a well-flowered *Stephanotis floribunda*, and other masterly-trained plants, which placed his name first on the list on that occasion. Mr. Donald still exhibits flowering and foliage plants with great success. Indeed his foliage plants were awarded first prize at the last great exhibition in Regent's Park; but he has found that the claims of a large establishment which he has to supply with fruit, vegetables, and flowers, besides the requirements of a large flower garden (and spring and summer bedding is no

joke now-a-days), admits of but little time for manipulating exhibition plants. It does not require much ingenuity to discover that the exhibition tent is not the true test of the ability of the gardener; and the way in which the schedules have been compiled to allow plants ready for exhibition to be brought the day before the show, or on the same morning if you like, gives a further advantage to the longest purse. However, this is straying from the point, and may be the text of an article some other day.

Mr. Donald has been a servant in the family for twenty-four years, and during the whole of that time he has been modelling and remodelling the grounds and gardens, the whole having been laid out at different times under his direction. On first walking through the grounds you are reminded of the Regent's Park Botanic Gardens; not that there is much resemblance between them but this—anyone not knowing the extent of the

Fig. 2.—KNOTT'S GREEN.

Botanic Gardens would think them much larger than they really are, and the same impression is conveyed here. All gardens and grounds near large cities are necessarily small, and the highest art of the landscape gardener is displayed in making them appear as large as he possibly can, and this is no easy matter where there are but very few natural advantages. Here there are none, the whole district being so flat and uninteresting. There is a small piece of water in the grounds which has been made the most of, and is a great aid to the effect of the grounds; and Mr. Donald no doubt finds it useful for irrigating purposes during the summer months, as the rainfall is much below the average of the United Kingdom. In the grounds are some noble trees. A grand Plane is 32 yards in the spread of its branches; *Oratus latifolia*, a handsome specimen of which was loaded with its clusters of white flowers in June. A large specimen of a species of *Mespilus* is an attractive object in front of the large conservatory.

#### FLOWER GARDEN.

This consists of a number of plain beds on each side of the principal walk in the grounds, and a series of long borders running along the outside of the boundary wall of the kitchen garden. One or two noticeable features in the flower garden is that the summer and spring bedding work into each other. In one or two beds the summer occupants had been put out

before the others were removed. Further, very nearly all the beds and borders were filled with plants that could be easily propagated in the spring or wintered in cold frames. The long border is very effective, and is filled-in with the following plants. The edging nearest the walk is *Cerastium tomentosum*, the inside edging Silver-variegated Thyme. The space 8 feet wide between the two edgings is of scrollwork, the following plants being used: A very dwarf double yellow French Marigold, the old *Saponaria calabrica*, *Echeveria secunda glauca*, *Viola cornuta* var. *Perfection*, Golden Chickweed, *Iresine Lindleyi*, and *Pelargonium Harry Hieover*. It will be observed that with the exception of the last two plants all the others were raised from seeds in the spring, wintered out of doors or in cold frames. Two oval beds were very pretty; they were edged with *Sempervivum californicum*, next *Alternanthera amens*, with centre of *Pyrethrum* and *Amaranthus melanochloicus ruber* dotted down the centre. *Viola cornuta* var. *Perfection* is much used.

#### CONSERVATORY.

This is a very large building, and has just been erected in the centre of a long corridor which used to be considered the conservatory, but it was too narrow and confined for pleasant exercise for the family during inclement weather. The new building forms a pleasant promenade, and a purer healthier

atmosphere can be maintained in it. In the passage leading to the conservatory a border has been formed which is planted with *Lapageria rosea* and *L. alba*, with *Tea Rose Maréchal Niel* to be trained overhead. The internal arrangement is unique in its way. There is a background of artificial rock and water falling over it; this has been planted with Filmy Ferns, such as *Todea superba* and *pellucida*. The Killarney Fern also luxuriates in quiet nooks. On prominent positions on the rockwork *Yuccas*, Ferns, Palms, *Cordylines*, *Dasyliirions*, &c., have been planted, and in a few years they will cover the rugged rock, and the effect may be imagined. The plants in the centre are arranged in two large beds, and you can walk round and examine the plants in detail. The side stages are formed of ornamental ironwork and slates covered with broken shells.

Passing out of the conservatory into the arcade we reach a warmer house, where are some handsome foliage plants. *Cycas circinalis* is magnificent, which, by the way, formed one in the first-prize collection exhibited at Regent's Park last month. Mr. Donald also grows the Fountain Plant of India (*Croton angustifolium*), better than most gardeners; it requires plenty of light, and to be kept free from red spider. Another house devoted to Ferns, and then we pass into the kitchen garden, which contains, besides the usual forcing houses, vineries, Peach houses, pinneries, Cucumber houses, &c., a plant stove and a cool house with a north aspect for retarding plants. This last is a lean-to, and without such a house it is difficult to preserve plants in bloom for a length of time. The stove is a large span-roofed structure in two compartments, containing the usual selection of stove plants. *Stephanotis floribunda* and *Dipladenia boliviense* are cultivated in pots, but the growths are trained to the roof to be trained round a trellis to form specimens when the flowers begin to open. The *Dipladenia* is a very pretty species, quite distinct in the colour of its flowers, which are white with a pale yellow throat; they are also very freely produced.

#### PEACH HOUSE.

This is a lean-to, and the trees are trained in the old-fashioned way to a trellis of horizontal wires fixed to the rafters; they were in good health and bearing a very heavy crop of fruit. Royal George, Teton de Venus, and Noblesse are the sorts Mr. Donald considers best for forcing.

#### VINERIES.

The first is a house devoted to Black Hamburg, the Vines trained on the short-spur system, and bearing a heavy crop of fruit. There is also a large crop in the Muscat house. The next is a late house planted with Lady Downe's, but the fruit had not set very well. Lady Downe's requires a little attention when the bunches are in flower, and a temperature of 70° at night. There is a remarkable plant of Chasselas Musqué in this house. Although on its own roots it grows as freely as a Hamburg; the bunches and berries are more like those of the Royal Vineyard than the Frontignans, to which class Chasselas Musqué belongs. Peaches and Apricots on the wall are a heavy crop, and the trees are in good health.

#### THE KITCHEN GARDEN

Is well cropped, but there is only space to notice the Lettuce, which attracts attention as you stand in front of the vineries; the variety is All the Year Round. President, Mr. Donald considers the best Strawberry. At the time of our visit it was the great local flower show. Mr. Barclay very kindly allows the Committee of the Leyton, Woodford, &c., flower and fruit Show to hold their Exhibition in his grounds, and his kindness and consideration are also shown to the gardeners and visitors from a distance by substantially providing for their comfort, an act of kindness which is duly appreciated by them.—J. DOUGLAS.

#### CANTERBURY BELLS.

AMONGST the most telling and beautiful border flowers are these gay Campanulas. The white is pure, the blue rich, and the rosy pink-tinted varieties are particularly attractive.

The strain, the flowers of which possess coloured calyxes, is a great acquisition, as affording a greater mass of colour and also of longer continuance than the normal varieties.

This is admirably adapted for conservatory decoration, as affording a mass of colour which is always welcome in glass structures; indeed, than fine plants of *Campanula media calycanthema* nothing can well be more distinct and attractive.

Seed should be sown at once, and be encouraged to germinate

quickly. It is best sown thinly in pans, to be placed in a frame, and have shade and water. If sown in the open garden, and dry weather sets in, the plants may not attain a size sufficient to bloom well. The seedlings should be transplanted in good soil in the open garden where they may remain all the winter, but it is as well to pot in the autumn those required for indoor decoration, and winter them in cold frames, when a somewhat earlier bloom will be obtained.

It is only recommended that the seed be sown in pans because of the late period of the year. It should properly have been sown a month ago in the open ground. Experience, however, has proved that if sown at the present time as above directed, beautiful plants will be produced which will contribute a rich effect in either the conservatory or garden.

The extended culture of these Campanulas is strongly recommended, and those who procure seed at once will eventually have a return more than commensurate with the trifling outlay and little care required to produce a supply of plants. But time is on the wing, and there must be no delay in sowing the seed.—AMATEUR.

#### NOTES AND GLEANINGS.

In reference to the FAULT CROP of this season, Mr. Francis Dancer of Little Sutton, one of the largest growers in the neighbourhood of London, says, "We are propping up our trees in all directions."

— An important discovery has been made by Mr. Worthington G. Smith in connection with the POTATO DISEASE. That gentleman has found that the same fungus which produces the murrain from which the Potato has been suffering during the last forty years is the same as that which produces the "curl" or "new disease" with which we are at present threatened with a recurrence. The only difference is that in tubers affected by the curl Mr. Smith has found the "resting-spore" which he never before detected in those affected by the murrain. The difference between the two diseases is the Murrain is the result of the fungus attacking the leaves and haulm after the tubers have been fully, or nearly so, grown; and the Curl is the effect of its attack on the collar of the plant before it has made much growth, and before the tubers have attained any size. In consideration of this discovery the Royal Horticultural Society at the Scientific Committee, of which Mr. Smith first announced the result of his investigations, have through the Council awarded him a Gold Medal as a reward of merit.

— At a Committee Meeting held at the HORTICULTURAL CLUB HOUSE on Wednesday the 7th inst., T. E. Barlett, Esq., of Pennell Court, Aylesbury, and Wentworth Buller, Esq., of Exeter and Clifford Street, were elected members of the Committee; and the following gentlemen balloted for and admitted as members of the Club: Professor Dyer, Dr. James H. Bannet, Dr. Denny, Dr. Stiles, Messrs. W. E. Dixon, Wm. Marshall, J. T. McCullum, J. A. Anderson, Burnaby Atkins, G. F. Barrell, Robert Veitch, and E. R. Cutler.

— We understand that Messrs. Sutton & Sons' extensive ROYAL MUSEUM OF AGRICULTURAL PRODUCTS is being exhibited at the Great Agricultural Show at Taunton.

— THE HORTICULTURAL SHOW IN BURGHLEY PARK in connection with the Northamptonshire Agricultural Society's Meeting on the 15th and 16th September next, bids fair to be on an extensive scale. The schedules of prizes, and also those for cottagers, are issued, and may be had on application to the Secretaries. P. McKinlay, Esq., of Woodbine House, Beekenhams, Kent, has presented four prizes of £1 10s., £1, 10s., and 5s. for six varieties of Potatoes, six of each sort, to be grown and exhibited by cottagers.

— You have informed the readers of the *Journal of Horticulture* that a special ROSE SHOW would be held at Lyons on the 11th, 12th, and 13th of June. Rose-growers and amateurs who know that the best Roses in their collections have been raised at Lyons must have been waiting with anxiety the report of that Exhibition, particularly on account of the new seedlings. Unfortunately the Rose Show required the authorisation of our Prefect, which was refused.—JEAN SISLEY, Lyons.

— We have received from Mr. Murray Mr. Darwin's new work on "INSECTIVOROUS PLANTS," a subject which has of late engaged the attention of scientific observers and excited the curiosity of the public generally. In such hands as Mr. Darwin's we expect to find the subject treated in the masterly manner in which that great naturalist always does whatever

comes within his grasp, and in this we are not disappointed. We will shortly return to the subject and give it a more lengthened notice. In the meantime it is sufficient to say that those who have not seen the book will do well to procure it without delay.

— We are requested to invite the attention of persons interested in Pelargoniums to the fact that the Exhibition of the PELARGONIUM SOCIETY will take place in the gardens of the Royal Horticultural Society, South Kensington, on Wednesday next, July 21st. It may, perhaps, prevent some confusion as to the entries if it is pointed out that the Show, being held subject to the regulations of the Royal Horticultural Society, notices of entries should be sent in to Mr. Barron at South Kensington in the usual way. The annual meeting of the Pelargonium Society will take place at Chiswick, by permission of the Council, on the afternoon of the 22nd inst., the day following the Show; and as it has been suggested that the members should dine together after the Meeting, it would be well that those who may be able or desirous to do so should notify this to the Hon. Secretary not later than Tuesday, in order that arrangements may be made for their comfort and convenience.

— On Tuesday the 6th inst. the EMPLOYEES at the WALTHAM ONES NURSERIES were entertained at supper by Mr. Arthur W. Paul, son of the proprietor of the nurseries. The supper was served in one of the greenhouses, having been preceded by a holiday. Subsequently the main walks of the nurseries were illuminated with oil lamps and Chinese lanterns, about a mile of chains being used to support them. The band of the West Essex Yeomanry was stationed in the nurseries, and played during the evening. At 9 P.M. the nurseries were thrown open to the public, and between five and six thousand visitors availed themselves of a most agreeable promenade. A handsome inkstand was presented to Mr. Paul, jun., by the employees.

#### THE OLD MARKET GARDENS AND NURSERIES OF LONDON.—No. 2.

I do not know whether any reader will dispute my right to speak of the old gardens of the City of London under the heading of "market gardens," yet it may be as well to give proof that they may be lawfully so designated in some sense. London citizens have always been famous for their skill in trading; and at an early period citizens and gentlemen too—nay, the very clergy also—did not hesitate to make their gardens in the City or its outskirts a source of profit. They might have given away the surplus above their own requirements to the poor, especially the Church dignitaries, but they did not in the general way do so; let us hope they did so sometimes. As, however, in our own day amateurs see nothing unbecoming in the act of sending their fruit and vegetables into the market, we need not pass a vote of censure on London citizens in the days of the Henries or the Tudors, at least not on this ground. But it would seem from some of the old chroniclers that these citizens, or their servants, were not unfrequently to blame for the way in which they disposed of the refuse of their gardens, which, instead of being properly decomposed and then utilised, was allowed to remain to vitiate the air and offend the noses of residents in the neighbourhood. We gain a little inkling into the way in which City produce was sold a few hundreds of years ago by an old petition dated 1845, which still survives amongst London's records, and which was addressed by the gardeners of several earls, barons, bishops, and of sundry citizens of London also, to the Mayor. The burden of it is a complaint that they were not then allowed to stand in peace, as had been their privilege heretofore, in front of the church of St. Austin, there to vend the garden produce of their said masters, but were ordered off by some officials or other persons, representing the functions of our modern police, I suppose. There are always two sides to a story, and a declaration was made on the other hand by the clergy that these gardeners were a nuisance to the priests singing matins and mass, and to many, both clerks and laymen, who were passengers, by reason of the scurrility and clamour in which these and their assistants indulged themselves while selling pulses, cherries, vegetables, &c. Pulses, we may presume, stood for Peas and Beans: we have here incidentally another proof that London City and its suburbs were once famous for Cherries. However, the Mayor found himself obliged to give orders that they should no longer vend garden stuff in that spot, and the gardeners had assigned to them a new place between the south

gate of the churchyard and the garden wall of the Black Friars of Barnard's Castle.

Of course, as London gardens became quite insufficient to supply the City with vegetables and fruit, country folks mingled with these City gardeners, and in fact, as it might be supposed, at last drove them out of the field. Various chroniclers have references to the early coster, or costard-mongers, who made the streets echo with cries that would now indeed seem extraordinary. "Ripe young Beans!" would not attract us, for we do not prefer Beans for the table that are "ripe," if we understand by the word Beans with the pods fully matured. "Ripe Cowcumbers!" with an emphasis on the *cow*, is not so unlike the nineteenth century, but we have not persons who make it their sole business to sell Artichokes, that vegetable being formerly in high favour. "White St. Thomas's Onions!" and "White Radishes!" are cries which indicate that an absence of colour was appreciated by our ancestors. A large trade was done in herbs which were used, not merely in soups and pies but were also employed in decoctions and infusions for medicinal purposes, seeing that foreign and more potent drugs were scarce. A proclamation of the reign of Charles I. denounced pretty strongly oyster-wives, herb-wives, tripe-wives, and others of the street-vending class, on account of the noise they made; thus proving that these folks in Stuart-London understood and acted on the principle that if you want business you must call it, and not wait for it to come to you.

London was then progressing marvellously, and the garden ground in the City limits had greatly diminished, but in the fourteenth and fifteenth centuries there was much of the land under cultivation for culinary purposes, while orchards and pleasure gardens well shaded with trees gave a semi-rural aspect to the vicinity of some of the bustling thoroughfares. To nearly all of the respective Halls of the Companies was attached a plot of open ground, and then there were besides the domains of nobles resident in the City and those of the well-to-do citizens; yet it would seem that the largest part of the garden land or vacant space belonged to the different monasteries and convents, then excessively numerous. And in many cases, besides the ground held by the Church in connection with some building, there was a separate residence belonging to the abbot or prior at a distance from it. What the monks grew I suspect they rarely gave away, as the conventual life does not usually affect men's appetites unfavourably; at least, if we are to believe history, it certainly did not in those days.

A mention of a few of these will show how much land was formerly at the disposal of ecclesiastics, and makes us more indignant to think that these establishments, as Rymer tells us, were exempt from all rates and taxes—they had not even to pay highway tolls.—J. R. S. O.

#### NOTES ON VILLA AND SUBURBAN GARDENING.

THE STRAWBERRY for forcing and general culture ought of necessity to claim considerable attention at this season, for as the fruiting season is now about over it will be the most convenient time for raising young plants for future crops. The fashion of allowing a Strawberry bed to exhaust itself in one spot for a number of years is fast dying out, for by such a plan of culture where the plants young and old are allowed to become mixed together as if it were a grass plot, it cannot be so satisfactory in its returns as by the new plan of growing every sort separate, and every row, and every plant in the row, has its space to itself. By this plan high cultivation can be more easily practised, and the returns are therefore greater and the fruit finer and of better flavour than in the case where old stools and young runners are mixed together in the same beds.

When I first went in a garden to work it appeared to be a question of pride as to who could keep a Strawberry bed in bearing the longest; the palm generally falling to those whose soil was of a rich and rather tenacious character, for this is the kind of soil the generality of sorts will best thrive in; but in these days three or four years is considered a fair time for the duration of a Strawberry bed. During this time the plants should be well attended to, and no useless runners should be allowed to remain attached to the plants to draw the vigour from the fruiting plant.

The ground should be well prepared by deep trenching and rich manuring before planting, and after that the soil around the plants should be kept as clean as that of a flower bed, and by surface-dressing with manure while the plants are in a bearing condition, together with ample waterings in dry weather, will make up the principal conditions under which heavy crops of fine fruit are produced. By this plan the sorts can be kept true. Every plant that proves unhealthy or unfruitful

can be weeded out, and the process of gathering and otherwise attending to the plants and fruit can be done much more conveniently.

Those who contemplate making new beds should raise the plants at once. There are several ways of doing this; but if for forcing purposes a capital plan is to select the best young plants, and fasten them into small 60-pots, full of a good mixture of soil, without detaching them from the parent plant; here the pots are soon filled with roots, and the young plants may then be cut off, and be placed together on a bed of ashes or soil, for say a fortnight; they will here make a lot of roots in that time, and should then be potted into larger pots, in which they are to fruit.

Some use 24's or 8-inch pots, but for my part I consider them too large. Those called 32's, or 6-inch pots, are plenty large enough, and even in pots a size smaller the Strawberry plant fruits well. Why large pots are not so suitable is because the plants have little time to do their work before winter sets in, and at that time the pots ought to be full of roots; but if the pots are too large they cannot be so, and moreover for forcing in a small way with little room to spare, large pots would not do.

A very suitable soil for them is a strong loam, say two-thirds to one-third of rotten dung. They should be potted rather firmly, and let the pots have a broad piece of broken pot at the bottom, with rough turf or rotten dung over it.

Now there is not a doubt that the above method is as good as any for raising plants for outdoor plantations also, because the object should be to have the plants well established and strong before winter sets in, and besides, if well grown now, they will produce a fair crop of fruit next year; and although there are other ways when many are required to be raised, such as cutting the little plants off and pricking them out thickly on a bed of nicely-prepared soil, or by letting the plants root in the place where they grow, and taking them up carefully with a trowel, and finally planting them out; but they require much extra care that way, and do not do so well the first year, neither would they be so likely to withstand the severity of the weather. By the pot system almost, if not quite, a season is gained, because the plants raised in a less substantial manner would not be much more forward at the end of next season than these will be at the end of this present one. Always take runners from the most healthy and fruitful plants.

A word as to sorts, of which there are now many in cultivation; and I am of opinion that few, if any, excel the Keen's Seedling for either early forcing or for general plantations. There are many larger sorts. Sir Joseph Paxton is a large good-flavoured Strawberry, so is President, La Constante, British Queen, and Dr. Hogg. The last-named is more uncertain than the others, for it does not do well in all places. For forcing they may be carried into the forcing pit in the order they are named; and for outdoor plantations Keen's Seedling will come in first, Sir J. Paxton and President nearly together, but the latter keeps in bearing the longest, then comes La Constante, and next British Queen, and last of all is Dr. Hogg. When this variety does well it is good in all qualities either for pot culture or garden cultivation.—TROS. REEBOB.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### HARDY FRUIT GARDEN.

We have finished layering the Strawberries except in the case of one or two scarce varieties of which the runners were not ready. It may be as well to mention that all our plants are layered as soon as we can obtain runners, both for planting out and for pot culture. It is best to use small pegs to keep the runners in their places; some growers recommend a stone placed on the bine to hold it in position, but the stone does not hold the runner firmly if careless feet are treading amongst the plants to gather fruit or to apply water to the pots. The runners are generally established in two weeks, and ought to be cut away from the parent plant, as the pots are generally crowded together on the beds and the leaves become drawn. In another fortnight from the time of cutting away the runners from the parents they may either be planted out or potted, for if they remain too long in the small pots these become too much crowded with roots, and the growth of the plants is checked. Our ground is not prepared as yet, but it will be deeply trenched immediately, working some good manure into the bottom of the trenches and some nearer the surface. The Strawberry beds will be made on the ground which has just been cleared of early Peas and early Cauliflowers.

White or Sprouting Broccoli may be grown on the ground occupied by the Strawberry beds, and for this crop it is not necessary to do more to the ground than to hoe off the Strawberry plants and to put out the Broccoli plants at once. Digging or trenching the ground sometimes does harm, and applying manure to the ground enriched the previous year causes a gross succulent growth, with which the frost plays and havoc during

the winter months; whereas the firm stocky growth made on the solid ground gives compact firm heads, and there is not half the risk of winter frosts doing damage to the plants. Planted out *Coleworts* for use late in autumn and early in winter; it is desirable to plant again a month hence. Sprouting Broccoli has also been planted out.

Having finished summer-pruning all dwarf and pyramid-trained fruit trees, nothing remains now to be done but to keep the ground clear of weeds by occasional hoeing, and if time permits, to look over the trees, removing all fruit attacked by the Apple-boring maggot. Now is the best time to destroy this pest, which often becomes a serious hindrance to fruit-culture, when, as was the case once with us, quite three parts of our choicest Apples were destroyed and a large proportion of the Pears. Nothing is better than hand-picking, and all the fruit should be taken away and be destroyed. In fact, it was once taken into serious consideration to destroy all our fruit for one season as soon as it was set; the entire crop would have been lost for one year, but the maggot would not have been able to breed, and we might have got rid of it entirely. Certainly this plan would have been the best one if no other fruit trees had been in the immediate neighbourhood.

Many persons will not thin their wall fruits until after the stoning period: this will now have been effected. Peaches and Nectarines ought to be thinned out to the required number at once. It is a great mistake to allow wall trees to bear too much fruit. One Peach to a square foot is quite thick enough. Nectarines may be a little closer, but it has been proved again and again that not only the finest fruit but the heaviest crop has been produced when the fruit has been judiciously thinned out. The finer varieties of Pears on the walls must also be well reduced in numbers according to the size of the fruit. It has not been necessary to water the wall trees as yet, but this ought not to be neglected if a dry period sets in.

### VINERIES.

We have cleared off the fruit from the Vines in the earliest houses; and the leaves, though considerably damaged by the attacks of red spider, have not suffered so much that the Vines will be injured. One gardener we heard of, who had some very well-ripened Muscats, stated that he had not a leaf left on his Vines. The fruit would no doubt colour well under such circumstances, but it would be wanting in flavour, and the Vines will certainly start into growth, which will weaken their chances of producing good fruit next year. Our aim now is to keep the leaves on the plants as long as we can, and it is possible to do this by washing the leaves well with a good garden engine; the houses are also aired freely night and day. The old gardeners advocated taking off the lights from the roof altogether. This is not necessary, unless they are required to place in the front of walls to ripen the crops of Peaches or the finer Pears. We have never taken the lights off during the summer and autumn months, but all the air is admitted that it is possible to give the Vines, and all the attention required now is to see that they are kept clean, and have all decaying leaves removed. The Grapes are commencing to colour in the late houses, consequently the supply of atmospheric moisture is diminished, and a circulation of air kept up night and day. At this season a high night temperature is to be avoided, but the weather has been so dull and cold during the past week that it has been necessary to have fires in all the forcing houses.

### ORCHARD HOUSE.

The fruit has received a final thinning on all the trees, and both Plums and Pears have required to be thinned out this year. The trees are making rapid growth, and it has been necessary to stop the growths, and where these are too thickly placed to thin them out. At frequent intervals a portion of the surface-dressing is applied, and this is better than putting too much on at one time. A high temperature is kept up by keeping the house moderately close by day and shutting up early in the afternoon.

### GREENHOUSE AND CONSERVATORY.

*Pelargoniums* that have done flowering are removed out of doors. Some persons lay the pots on their sides to "dry the plants off." It is a serious mistake this system of drying everything off as soon as the flowering period is over, and it is most unreasonable. The wood is not always ripe, and if this is not matured drying-off will not do it. When the wood appears ripe we water only moderately, but always giving sufficient to prevent the young rootlets from being destroyed. If a heavy fall of rain should take place, or continuous wet, the pots are laid on their sides, but are placed upright in dry weather. Of course some will say this is a deal of trouble; well, it is as to those who have little heart in their work, but success in gardening is only attained by taking great pains with even the minutest details of the work. When it is time to cut the plants over, the mould in the pots ought then to be quite dry, which will prevent bleeding. In a very few days after cutting the plants over the buds will start into growth, and then water may be applied to the roots.

We have removed the *Ascleas* from the greenhouse to a house

where they can have more heat. The plants are well syringed twice daily, and besides artificial heat, the house is shut up early, say at 4 p.m. It is necessary to shade when the sun acts directly upon the glass. Small plants have been potted; good turfy peat without any other mixture is the best potting material for *Asaleas*. The pots must also be drained well, and some fibry material be placed over the drainage to prevent the finer particles from mixing with it. *Asaleas* when making their growth require considerable supplies of water, and if it cannot pass through the pot freely the peat becomes soured, the foliage assumes an unhealthy tint, and the chances are that the plant is dead before the cultivator knows it, unless he has large experience in plant-culture. A few *Carnations* and *Pioteas* arranged amongst the plants have a very good effect, and the ran flowers of *Carnations* are quite as attractive to the uninitiated as are the pure flowers, and they are very useful for cutting; indeed, some that run to seeds of the scarlet and purple shades are even more useful for this purpose.

The pendant drops of the *Fuchsia* ought not to be dispensed with in the greenhouse all through the summer. It is thought to be a common flower, and therefore not aristocratic enough for some. These who would like to see this old favourite trained to the best advantage should visit Mr. Fraser's nursery in the Lea Bridge Road, London. They are trained to the rafters of his show house, and the effect of the crimson and white drops pendant overhead is charming. Not all the varieties are adapted for this mode of culture. Those grown and recommended by Mr. Fraser are *Arabella*, white tube and rose-coloured corolla; *Delight*, crimson tube and sepals, white corolla; *Hugh Miller*, tube and sepals pink, purple corolla; *Noblesse*, crimson sepals, dark violet corolla; *Snowdrop*, scarlet sepals, white corolla. These are all single varieties. Amongst the double sorts are found the following: *Alpha*, tube and sepals red, corolla blue; *Avonmore*, carmine tube and sepals, violet corolla; *Diadem*, tube and sepals red, dark violet corolla; *Empress*, tube and sepals white, red corolla; *La Neige*, tube and sepals red, pure white corolla; *Maréchal McMahon*, tube and sepals bright red, plain corolla. *Fuchsias* require to be potted in rich turfy loam, and when growing freely they require plenty of water.

Training the young growths of *Lapageria*. The white-flowered sort is even more robust in its growth than the older red variety. They are now growing freely, and the young shoots require to be carefully handled, as they are easily bruised. The best trellis to train them to is one of iron wires placed a foot apart, the intermediate spaces to be filled with string. The shoots may be allowed to twine round this, but not round the wires. The plants ought now to be syringed daily.—J. DOUGLAS.

## HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

DARLINGTON.—July 16th, at Southend. William Hodgson, Sec.  
 COVENTRY (at Coombe Abbey).—August 17th. Mr. T. Wigston, 2, Portland Terrace, Sec.  
 BRISTOL.—July 19th and 20th. Mr. R. Fox, Sec.  
 BRISTOL.—July 22nd. Mr. W. J. Roberts, Sec.  
 BRIMSWORTH, N.B. (Rose Show).—July 23rd and 24th. Mr. W. Ure, Wadell, Sec.  
 GLOUCESTER.—July 24th. Mr. S. H. Williamson Hon.-Sec.  
 BRIDGE.—July 27th. Mr. E. Hardman, Hon.-Sec.  
 PASTON.—July 28th and 29th. Mr. W. Troughton, 4, Church Street, Hon.-Sec.  
 SHEFFIELD.—July 28th and 30th. Mr. H. W. Admitt, Hon.-Sec.  
 SOUTHAMPTON.—July 31st and August 2nd. Mr. C. S. Fridge, 22, York Street, Lower Avenue, Sec.  
 REDBURY (Cottagers).—August 3rd. Mr. W. M. Hughes, Sec.  
 WESTON-SUPER-MARE.—August 4th. Mr. W. B. Frampton, Sec.  
 ILKESLEY AND SHIPLEY.—August 4th and 5th. Mr. E. Blount, Sec.  
 NEWPORT (MONMOUTHSHIRE).—August 5th.  
 OLEY.—August 7th. Mr. Jno. Lee, Hon.-Sec.  
 ROSEDALE-NEWCHURCH.—August 7th. Mr. M. J. Lonsdale, Newchurch, Sec.  
 CANTERBURY.—August 19th.

## TO CORRESPONDENTS.

"All correspondence should be directed either to 'The Editors,' or to 'The Publisher.' Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

WILD ROSE IN IRELAND.—Rev. S. A. Brennan, Pomeroy Rectory, Co. Tyrone, writes, "In your issue of July the 1st, answering the query in regard to a Rose which I sent to be named, you mention that you would wish to know

the circumstances of the Rose which you state is apparently 'Rose Gallica.' It is very common in the Co. Tyrone, Monaghan, and Fermanagh, growing in hedges and by riversides away from houses, seemingly in a wild state, which has puzzled me, as no notice seems to have been taken of it by botanists."

ROSE FOR WALL OF VINEY (J. L. C.).—No Rose that we know would give satisfaction trained to the back wall of a vineyard, the position being too dark from being shaded by the vines; but if, of course, it were only moderately shaded Miss Gray (Noisette) or *Maréchal Niel* (Tea-scented) would answer. We do not remember having overlooked your query.

EVERGREEN FOR NORTH ASPECT (*Idem*).—*Ocotoneaster microphylla* would suit, and for a north wall nothing is finer than *Jasminum nudiflorum*, which flowers in winter, but it is not evergreen. *Berberis Darwini* might also probably succeed. For a north aspect nothing is comparable to Ivy in its green and variegated varieties.

LARGE FUNGUS (C. B.).—The large fungus of which you have sent a portion is the "Giant Puff Ball," and is edible. You may cook them thus:—Slice them an inch thick; have ready some chopped herbs, pepper, and salt; dip the slices of Puff Ball into yolk of egg, and sprinkle the herbs upon them; fry in fresh butter, and eat immediately. They are lighter and more wholesome than egg omelettes, and resemble brain fritters," so says Mrs. Huxley.

DARLINS (Della Rocca).—The cause of your Dahlias making roots but no top-growth is, we imagine, the results of overprying the roots during the winter. If kept too dry the crowns shrivel and the buds are killed, while the more fleshy part of the tubers remain sound and emit roots.

CATERPILLAR (*Biceps*).—The caterpillar crawled out of the box and disappeared. Could you send us another?

COMOPHALLUS SULCIFRONS (H. G. W.).—This is quite a different plant from "Lords and Ladies," though it belongs to the same natural order.

SHEDDING PANSY (*Viola*).—The flower was completely shrivelled up, but we could see that the colour is good.

GREEN ROSE (H. W. Lowe).—The green Rose is not at all uncommon. You will see it figured and many notices of it in our twenty-third volume.

CHEQUER OR CHEEK TREE (J. P.).—This is *Pyrus torminalis*.

HERBARIUM SPECIMENS (G. B.).—Apply to Mr. F. Y. Brocas, 4, MITT Street, Hanover Square, W. He may also be able to inform you where the seeds are to be had.

HYBRIDIZATION (P. Stubb).—There is no work on "artificial hybridization" that we know of. There is no difficulty in performing the operation in an ordinary way, which may be done thus:—When you have chosen the two plants which you intend to hybridize, and decided which of them is to be the seed-bearer, remove from this all the stamens as soon as the flower is sufficiently expanded to enable you to do so. See that the anthers have not yet burst and distributed their pollen on the pistil. Then take from the other plant some of its pollen on the point of a camel's-hair pencil, and apply it to the tip of the pistil, which is called the stigma, of the other, and that is all that is needful for you to do, Nature will do the rest.

PLANTS FOR SPRING BEDDING (Paul).—Excepting annuals you have put off until too late the sowing of seed of some plants which are useful for spring bedding. We name a few for autumn sowing—*Collinsia verna*, *Laetia californica*, *Linanthus Douglasii*, *Nemophila insignis* and its white variety, *N. maculata purpurea*. *Pyrethrum Golden Feather* may be sown for its foliage, also *Dall's Crimson Beet*, *Sagoraria calabrica* and its white variety, *Silene pendula alba*, *S. pendula compacta* and its white variety, and *Silene pendula ruberrima*.

PROPAGATING GOOSEBERRY AND CURRANTS (*Sergeant*).—Take cuttings of the current year's growth in the autumn when the leaves have fallen, and cut into lengths of about a foot, removing all the eyes except the four uppermost, removing the weaker part of the cuttings—viz., the points, and cut transversely below the lowest eye or joint, and insert in rows a foot apart, and the cuttings about 3 inches asunder, putting them in the soil about 6 inches, and make the soil firm about them. They will be fit to transplant the autumn following. What other fruit is it you wish to know how to propagate? The Apple tree "broken off" at 18 inches from the ground we should securely stake if there is any portion of bark left unbroken, and then bind the stem over the broken part, and so as to bring close any splinters, with soft rope, bringing it above and below the broken part as far as at least as the rent extends, and cover this with a pigment of cow dung and clay well worked into a stiff mortar-like consistence, and cover the wounded part as in grafting, adding a little moss on the surface to keep from cracking. It may be sprinkled every day with water, which besides keeping the pigment from cracking will assist the flow of the sap. If there is no live bark your only plan will be to wait until spring and then graft.

SOIL FOR SCARLET GERANIUMS (R. L. E.).—For the pot plants we advise an admixture of three parts turfy loam, enriched with a part each of leaf soil and well rotted manure, with a sixth of silver sand, and good drainage. Those in the beds we should mulch with short manure, and point it in with a fork if you can do so without injury to the plants, but do not disturb the roots. The mulch may be put on an inch thick, watering freely during dry weather. Do not remove the plants for the adding of fresh soil, but give the beds a liberal dressing in the autumn of turfy loam, rather strong in texture as your soil is light, and manure freely, digging it deeply in before winter. This will make the soil more retentive of moisture, and will not cause greenness in growth, as would probably be the case were the manuring deferred until spring.

PELAGONIFLUM SNOW (*A Weekly Subscriber*).—Anybody may compete at the Pelargonium Show, whether a member or not.

SHEDDING GERANIUM (H. & S.).—We cannot call to mind anything that tallies with the description you give of your sport, but the varieties of all kinds of the *Pelargonium* are so numerous now that it is difficult to speak positively. Send it up to the Floral Committee of the Royal Horticultural Society.

ZONAL PELARGONIUMS (*Subscriber*).—The names of the raisers are given in parentheses—Hector, scarlet (Bull), Hector, rose (G. Smith), Warrior (G. Smith), Clipper (Bull), La Grande (G. Smith). We have no record of the raisers of the continental varieties which you name.

CAMELIZIA LEAVES SCORCHED (F. O. M.).—We do not think the scorching is due to deficient ventilation, but to a lens in the glass. You can easily by examination ascertain if this is so. It is easily preventable by applying a thin covering of whitening mixed with milk to the glass, and thus secure a partial shade, which is essential to the health of *Camelias*.

**GLAZING HARDY FERREY (Q.).**—You will find 21-oz. glass quite strong enough, and if it is shaded a portion of the day you need not go to the expense of rolled plate.

**PEACHES SPOTTED (Subscriber).**—The spot you allude to is, we suspect, mildew. Dust with sulphur, and give the trees on the back wall a soaking of water in which guano and common salt is dissolved at the rate of half an ounce of each to each gallon of water. This with a pure air will, we think, effect an improvement in your trees.

**PRIZE SCHEDULE (J. C. M.).**—Certainly black and white Grapes can be shown in a collection of fruit of six distinct varieties. If it had been six distinct kinds they could not.

**TREES SHADING BORDER (A Working Lady).**—You can cut the trees over now, and grub the roots in the winter.

**STRAWBERRIES (L. B.).**—Viscomtesse d'Harcourt de Thury, President, and Dr. Hogg are the varieties we recommend. You give us no date whereon to advise you as to the size of the beds. On cultural points you cannot do better than follow the advice of Mr. Record and Mr. Douglas which is given in another column.

**VINES RAISED FROM SEED (Walter).**—The Vines will fruit, but not in small pots; they should at once be shifted into 18-inch pots, and the canes be trained about a foot from the glass. They require free watering and sprinkling with water overhead twice daily. They should have a compost of light turfy loam three parts, well rotted manure a part, and a sixth of half-inch bones well mixed, and the pots well drained. We should not, unless you have heat, give the plants larger pots this season than 9-inch, and in spring turn them out of the pots when they begin to grow, shake all the soil from the roots, and repot in the same size, shifting into larger when the roots are filled with roots. We do not consider you have a chance of fruiting them until the year after next.

**MAUVE-COLOURED VIOLA (Idem).**—We do not know of a better than *Mauve Queen*. There is some mauve even in *Perfection*, but the seedling you describe as large as *Perfection* of a mauve colour may or may not be an acquisition. You should submit it to some authority, as most raisers do not care to trust their own judgment in determining the value of their seedlings.

**VINES UNHEALTHY (H. B.).**—Red spider—which we note is this year very prevalent—is the main cause of your Vines losing their foliage. The insects appear to be dead now, and your Vines with careful attention will recover. We should, however, give the Vines a thorough washing with the syringe—that is, apply the water forcibly to every part, avoiding as much as possible directly striking the bunches. We are aware this will wash off the bloom from the Grapes, but still we advise it as the lesser of two evils. That must not be a common syringing, but a heavy drenching. Afterwards paint the hot-water pipes with sulphur, and heat them sufficiently to cause a strong smell, ventilating in proportion so that the night temperature does not exceed 65°, and the day temperature with sun 85°. Leave a little air on at the top of the house all night, and especially increase it in the morning as soon as the thermometer begins to rise. Early closing—so long as the temperature does not exceed 65°—and early opening of the ventilators, are vital conditions in Grape culture. It is just possible the night temperature may have been kept too high and the house too close by not admitting air sufficiently early in the morning. That, however, is only conjecture. It is very common for a hitch to occur in some way on a change of gardeners, though no real fault of either. Time is necessary for a man to thoroughly comprehend not only the resources of a place, but its peculiarities and liabilities, and an able man will profit by any untoward and unexpected results. Write to us again in a month, and tell us the exact state of your Vines at that time, when we shall be glad to give you further advice on the matter.

**INSECTS ON VINES (H.).**—Fumigation with tobacco on two successive nights will destroy the green fly, following the fumigation by syringing. Clear water is the best antidote against red spider. By regular syringings and sufficient atmospheric moisture this insidious pest may be prevented doing injury. Where it is established thoroughly drenching the foliage, and subsequently creating a strong smell of sulphur by painting the pipes when they are heated, at the same time securing a pure atmosphere by a continuous current of fresh air night and day, is the best practice to adopt. Fumigation will not injure the Grapes, but syringing will disfigure them, but better submit to have the bloom partially washed off this year than to have no Grapes the next year. If the Grapes are nearly ripe, and the Vines not seriously infested by the red spider, the fruit may perhaps be cut before applying the remedial measures.

**CONSTRUCTING RANGE OF HOUSES (An Irish Subscriber).**—With so extensive a range for glass you should aim at more than a vinery, Peach house, and orchard house. We should have at least two vineries, or with three you might have Grapes very nearly the year round—viz., an early vinery to give fruit in May; a second vinery to come in at the close of July; and a late vinery which would afford fruit up to May—say 88 feet of early, 48 feet of second, and the same of late vinery, which will take up 184 feet. Then 86 feet of early Peach house, and 48 feet of second Peach house, and this will leave you 94 feet for orchard house. It may be that you do not wish to heat the range or reduce the heating to a minimum; in that case we should have 73 feet vinery, 96 feet Peach house, and 183 feet orchard house, but unless you have other houses the former arrangement would be infinitely better. The wall being up will be a considerable saving. The vinery or vineries we should have in the centre, and 18 feet wide; in fact, all that width, and a lean-to or with a short half-span at back if you object to a high back wall. The front we should have 5 feet 6 inches high, 8 feet of it glass, and have all the front lights to open as well as 2 feet 6 inches the whole length the upper part of the house. The depth of border you would need would be 8 feet 6 inches, and of this 9 inches should be drainage, and not less in width than half the extent of the house in width, as well as the inside. If you have trees against the walls then you will need borders the full width inside in addition to two-thirds the width of the house of outside border. We could not give an estimate of the cost, but that you may obtain by writing, stating what you require, to an horticultural builder.

**NAMES OF PLANTS (S. E. T.).**—The yellow flower is *Sedum reflexum*, the other *Drosera rotundifolia*. (D.).—*Gallium cruciatum*. (J. B. C.).—*Lisochilus speciosus*, Br. (G. B.).—1, *Philadelphus coronarius*; 2, *Castanea vesca*. The leaves are those of *Stachys lanata*. (Constant Reader).—Specimens very bad. 1, *Begonia* sp.; 4, *Veronica incana*; 5, *Gilia lutea*; 6, *Santolina* sp. (W. T.).—Apparently a species of *Ixora*. (B.).—*Agrostis* sp.? The specimen is poor. (G. B. B.).—Your plants are *Crepis virens*, and (apparently) *Anthemis inodora*. You would find a British Flora useful in such cases. (Lady King).—You were answered in the Journal for July 1st. We can only repeat what is there said; it may be *Geranium pratense*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### KETTERING POULTRY, &c., SHOW.

THIS Show was held on July 6th and 7th during the Kettering Feast, when the little town was alive with visitors, and in many respects was a great success. We would strongly advise the Committee another year to have the pens strewn with coarse sand or road grit in preference to chaff, and above all to have it done before the birds are penned. In this case it was delayed until the morning of the Show, and many of the birds having come long distances without food should have been fed with meal dough and water on the Monday evening. Nothing is so beneficial to highly-bred specimens which are called upon to undergo much fatigue and privation in journeying to the various shows as good easily-digested food and the very necessary water, with a little green meat if possible. They then return to their owners as fresh as ever, and prevent those re-cremations which frequently pass between exhibitor and Secretary when birds are knocked-up or die.

The Committee, who, we understand, are more in the Pigeon and Rabbit than poultry fancy, would do well another year to revise their schedule. The single-bird system we admire, but it should not be made to crush certain breeds. Where all colours compete together one class is not sufficient either for Dorking, Coochin, Brahma, or Game, as the less perfect colours either put in a poor appearance or go to the wall; and it is a great mistake to leave out classes for French and Spanish, these four high-class varieties being cramped into a two-prize Selling class with Polish, Malay, and all the customary variety specimens. Game Bantams, which almost always fill, had only one class; we say one class, for although there was throughout the Show a class each for cocks and hens, yet as the whole of the sub-varieties competed together in those which we have named it is substantially one. In Ducks again—only imagine! Rouen and Aylesbury and Mandarins and East Indians being compressed into one class. In the Pigeons the birds were more liberally treated, the classes being very fair, and three prizes to each class.

In *Dorkings* Mr. Burnell took both firsts with very fine birds, the cock, however, having one bad toe; the second cock was a neat Dark bird in good order. In *Cochins* the first cock was a fine Partridge, in fine trim for the time of year, with good style and nice colour, though rather high on his legs; second a good rich even-coloured Buff with good feet and comb. No 14 (Mrs. Tindal) was a very fine White, but rather yellow from the sun. This bird is one of the late Mrs. Williamson's celebrated stock, which we may mention has passed entirely into the hands of Mrs. Acton Tindal, adding a notable feature to her already fine stud. In hens first was the well-known Partridge, in nice order; second a pretty Buff. 20 (L. Wright) was a neat Partridge; 23 (Mrs. Tindal) a superb White, her comb throwing her for second honours; 23a (Harvey) a fine Buff, a little out of feather. In *Brahmas* first was a big Dark cock, rather long in leg and white in ear, otherwise good; second was one of the best Lights we know, grand in shape, style, tail, feet, and comb, but not a good white, or he would have won; a lovely-shaped young Light was very highly commended, but he is too small. In hens Mr. Lewis Wright won with a well-marked Dark hen; second a neat Light; highly commended Mrs. Peat, a nicely-shaped hen indeed; highly commended Mrs. Tindal, a superb bird but deep in moult. *Game* were very poor as a lot. First cock was a Brown Red of rich colour and in fine trim, but his tail puzzled us immensely; it was carried in an almost straight line with the back, and appeared to hang as though powerless. Second a fair Black Red. In hens the first was a good Brown Red; rest poor.

*Hamburghs* were a strong lot. In Pencil cocks first was a bird of fair colour, nice tail, and neat comb; second a fair old cock, but we should almost have gone to 47 (Pickles), good in colour, comb, and ear, though dark in tail; 53 (Tloker), a fair bird, but too bronzy in tail, and poor in head. In hens the prizes went to a couple of very good Silvers, the first better in breast; 56 was another neat Silver, not so fine in marking; 60 (Hallam) was a neat Gold. In Spangle cocks first was grand in wing and head, but not quite darkly marked enough; second a fine old Gold; highly commended a nicely-marked Silver. In hens first went to a Gold, good in colour, but though well marked too small in spangling; second was a Silver, which we preferred; very highly commended was a heavily-marked Silver. In Blacks first was a cock of rare quality, in nice trim; second a very smart bird indeed, but not so rich in shape. In hens the first excelled in colour, but was too dark in face; second a fine hen, good in head and ear, but not so rich; 84 (Foster), very rich in colour, but too pale in face.

In the Variety class first was a neat Spanish cock, good in face and comb; second a fine Gold Poland, large in crest, but not so well laced as could be wished; very highly commended

(Pickles), another, but bad in colour; very highly commended (Cutlack), a superb Crève, to which we should have given honour in hens first a superb Spanish, grand in comb, condition, and face; second a beautifully-crested Poland, but failing in lazing. Messrs. Outlook and Boothby also showed capital specimens the latter gentleman's Polish hen really deserving honours. In the Selling class first was a fair Dark Brahma, the same exhibitor winning in hens. Mrs. Pryor's pens were empty. In Game *Bantams* first was a rich-coloured cock, in nice trim second too short in head. The noticed birds were all good. Hens were very moderate. In the Variety class first was beautiful Black cock, in grand trim; second a good Silver-laced highly commended (Rev. F. Tearle), a capital White, only price at a guinea, and not claimed when we left. In hens first was beautiful Silver-laced, second a good Black, very highly commended a good Black, and the two highly-commended per excellent Whites. In *Ducks* first were fair Aylesbury, a better pair losing for want of better colour in the drake's bill; second very good *Vidua*; highly commended *Rouens* and *Mandarin*.

In *Pigeons* *Pouters* were a great feature, the White cock being one of the best we have seen in girth, symmetry, and length. The winning hen was also beautiful in shape. Mr. Harvey won both firsts with Blues, Red and Yellow winning the other first honours. In *Carriers* Mr. Yardley's hen ran away from the lot. The winning Tumbler was a neat Agate. In *Owls*, first was good foreign Blue, second and third Anglo-African Whites, both failing in beak. *Dragons* were a grand class of nineteen entries. First, Mr. Graham's grand Grizzle, about the best we ever saw and simply perfection; second and third also good. In *Jacks* first a good Yellow, second and third sound Reds. In *Fantails* first was a sweet bird in head and tail, second and third new birds also. In the Variety class a grand Mottled Trumpet was an easy first, a rich Red Priest second, and a good Yellow Barb third. In the Selling class were some good *Carriers* quickly claimed.

*Rabbits* were a great feature in the Show, and mustered strongly. The first Lop, a Black-and-white, measured 22½ by 5½, and the second, a Grey, 22½ by 5½. *Angoras* were very good indeed, the winners and Messrs. Hancock & Martin's notices pens being superb. *Himalayas* were also excellent, there being little to choose between the winners. In *Dutch*, first was a new Black-and-white, but we preferred the second, a lovely Blue third was a nice Grey, which was not level in the collar. There were several young ones which we think will make future winners. *Silver-Grey* mustered fourteen, the prizes going to the lightest *Rabbits*, all of which were very good. We were glad to see this shade of colour winning, and the dark-bodied and darker-headed animals thrown out. In the Variety class *Belgian Hares* took all the prizes, a good *Siberian* being highly commended. It struck us that many of the *Hares* smacked somewhat of the *Patagonian*.

(From another Correspondent.)

This pretty little Show was held on Tuesday, July 6th, on following day. We were pleased to find the birds were protected from the weather in a large airy tent. The management was good, the only exception being that the bottom of the *Pigeon* pens were bare. We would suggest for the consideration of this and other committees that dry sand or sawdust be used either of which would keep the birds clean and comfortable.

First on the list are *Pouters*, the classification of these being good. White cocks produce nine entries, mostly good birds, the first and second especially so. White hens, eight entries, first very good and in capital condition; second and third were not far behind. Black or Blue cocks, five entries.—All the winners were Blue. The first a grand bird, which, if we remember rightly, was first also at Thorne; second another good Blue third only fair. Black or Blue hens, only four entries.—First Mr. Harvey's grand hen. The only fault we find with this bird is that it is rather gay in crop. Second (Nottage), very good; third we did not care for. *Pouter* cock, any other colour, five entries.—First, Mr. Yardley's Red, a large and coarse bird; second better bird; third indifferent. Hen, any other colour, six entries.—First and second Mr. Pratt with two very good Yellow that fully deserved their position.

*Carrier* cocks, seven entries.—First, Mr. Miller with a stout Black in good condition. This bird only requires a little more time to make a good one. Second a good Black of great length third also a Black. *Carrier* hens, six entries.—First, Mr. Yardley's well-known Black, a grand bird; second another good Black; third only fair.

*Tumblers*, any variety.—First a very good Yellow Agate, but not in the condition we like; second a Kite belonging to the same exhibitor; third Almond, which we should have placed higher. Pen 218a (Silvester), a very good Almond that should have been in the list. Only five entries in this class.

*Owls*, any variety, five entries again.—First, fair Blue foreign second and third good White ditto. We particularly admire Mr. Allen's third-prize bird.

*Dragons*, any colour.—A large and good class, in fact the

ANY OTHER VARIETY.—1, Miss F. Rains, Kettering. 2 and 3, F. Coles, Northampton.

The Judges were for poultry Mr. R. Teesbay; Pigeons, Mr. F. Bequilliant; and Rabbits, Mr. King.

### WINTERTON POULTRY, &c., SHOW.

THE third annual Show of the Winterton Society was held on the 7th and 8th inst. in a meadow in the centre of the village. The weather was all that could be desired, and the site chosen was a suitable one. A capital marquee was provided for the poultry, and Turner's pens were used. The schedule was a pretty good one, but not such as to draw a great number of entries, considering that the Show was of two days' continuance (a mistake which we think will not be repeated), and the occurrence in this case of two other shows at the same time served to further curtail the returns in that respect, although under the circumstances the entries may be pronounced good.

*Dorkings* headed the list, and were a fair class of the Dark variety. The *Cochins* very good; first Whites, to which was awarded the section cup and also the cup for the best pen in the Show; the second and third were Buffs. *Brahmas* were a very good class in Dark, and of fair quality in Light birds. In *French* the whole were noticed; the first and second being *Crêves*, and third *Houdans*. *Game* were not of great note, except one pen of Brown Reds and one of Duckwings. In *Hamburgs* were some real good pens, but in both classes the third prizes were withheld. *Spanish* were good; the first a good cock with a wonderful hen, and second a very good cock with a moderate hen; the first-named taking the cup for the second section. *Polands* but one pen of fair good quality of the Golden variety. In single cocks the first was a Black *Hamburg*, and second *Malays*, both very good. In hens first was a *Spanish*, second *Brahma*, and third *Dorking*, and a very good class. *Bantams*, *Game*, were a large class, but only five pens were worth notice; the first *Piles*, and the rest *Black-breasted Reds*. The cup for the third section was awarded here. *Bantams* any other were a fair lot only; first and second *Blacks*, and second the old style of *Silver Sebrights*. *Barred* fowls were pretty good as regards the winners. In the Selling class the winners were *Brahmas* and *Crêve-Cœurs*. Two classes were provided for *Brahmas* of *Lincolnshire*, the *Light* poor, but *Dark* very good in all respects. *Turkeys*, *Geese*, and *Ducks* were not numerous, and but moderate in quality.

The quality of *Pigeons* stood high, although in some classes the entries were not numerous. In *Carriers* the winners were *Blacks*. In *Pouters* the first *Black*, which also won the cup for *Pigeons*; second *Blue*, as also the third. *Dragoons* were all noticed, being a grand lot; the first *Yellow*, second *Blue*, and third a *White* nestling of great promise. In *Antwerps* the first and second were *Blue*, and third *Dun*, all *Short-faces*. In *Tumblers* the first a grand *Almond* cock, second a *Yellow Agate* of grand head properties. In *Owls* a *White* was first, and *Blue* second. *Barbs* were very good, a *Black* cock placed first, and *Dun* second; the third, a *Red* hen, was not in good order, and must be cared for, or will be lost. *Turbits* very good, the first a *Blue* cock, second *Silver*, and third *Red*. In *Fantails* a *Blue* was placed first; the size, style, and carriage very grand, but not so good in tail as the second and third, which were, however, coarser birds. *Jacobins* good; the first-prize *Nun* such a bird as is rarely seen; the second, a *Yellow*, was a little faded. In the *Variety*, first was a nice *Loe Pigeon* of the spangled variety, second a *Blondinette*, and third a *Magpie*. *Red Barbs* were first in the Selling class, the second being *Magpies*.

In *Rabbits*, for which only poor provision was made, the first in bucks was a capital *Blue-smut* Lop, 22 by 4½, second a neat *Silver-Grey*, and third a *Fawn* Lop, 21 by 4½. In does a *Silver-Grey* had an easy win, this being a very good *Rabbit*, a *Lop*, 21½ by 4½; the third being *Dutch*. A class for *Belgian Hare* brought five entries of capital *Rabbits*; the otherwise best, a buck, highly commended, had a white nose, but should be good for stock purposes.

The stock entrusted to the care of the Committee was well attended to, and all were conveyed to and from the station (a distance of five miles) free of charge.

*DONKEYS*.—1, W. H. Crabtree, Levenshulme. 2, H. Pickles, Earby. 3, Simpson and Dodds, Bedale. 4, T. Sawyer, Winterton.

*COCHINS*.—*White*.—Cup and 1, W. Whitworth, Longlight. 2, W. H. Crabtree, 3, J. Smith, Lidoon. *Ac.*—1, W. H. Crabtree, Barton-on-Humber.

*BRAHMAS*.—*Light*.—1 and 2, W. H. Crabtree, 3, W. Whitby, Sheffield. 4, T. Newham, Barton-on-Humber. *Dark*.—1, W. H. Crabtree, 2, Dr. J. Holmes, Chesterfield. 3, W. H. Crabtree, 4, G. S. Pearson, Southtown, Great Yarmouth. 5, G. Thompson, South Ferryby. 6, W. J. Waters, Elham, Brigg; W. T. Millett, Farnfield, Liverpool.

*FRENCH*.—1, W. H. Crabtree, 2, Mrs. J. Wickes, Appleby. 3, G. W. Hibbert, Godley. 4, J. Grantham, W. Whitworth.

*GAME*.—*Black-breasted Red*.—1, H. B. Ayre, Winterton. Any other variety.—1 and 2, W. G. Waters, 3, Miller & Darley, Brigg. 4, O. Meggitt, Barton-on-Humber.

*HAMBURGS*.—*Gold or Silver-spangled*.—1, H. Pickles. 2, G. Holmes, Great Driffield. 3, B. Wilkinson, Alkborough, Brigg. *Gold or Silver-pencilled*.—1, H. Pickles. 2, E. Newbitt, Epworth. 3, J. Gilling, Winterton.

*SPANISH*.—Cup and 1, E. Newbitt. 2, J. Boulton, Bristol. 3, W. G. Waters, 4, J. Gilyard, Winterton.

*POLANDS*.—1, G. W. Boothby, Louth.

*ANY VARIETY*.—Cock.—1, T. A. Wright, Great Yarmouth. 2, E. Newbitt. 3, W. Sparrowhawk, Barton-on-Humber. Hen.—1, E. Newbitt. 2 and 3, Dr. J. Holmes.

*BANTAMS*.—*Game*.—Cup, 1 and 2, Mrs. E. Newbitt, Epworth. 3, W. H. Crabtree, 4, G. Holmes. *Ac.*—W. Smith. Any other variety.—1, W. G. Waters. 2, W. J. Warburton, Staleybridge. 3, W. Bygott, jun., Rye Hill, Ubley Junction. 4, Dr. Holmes.

*BARTONS*.—1, G. Robinson, North Frodingham. 2, G. Johnson, Winterton. 3, W. Sawyer. 4, W. B. Blanshard, Whiston (3).

JUDGES.—Mr. E. Hutton, Pudsey; Mr. F. Sales, Crowle.

### BRENTWOOD SHOW OF POULTRY.

THIS Show, as in comparison to that held last year at Stratford, was a great success. The management was different, and it was quite distinct from the general show close by. Mr. Tegemeier was Judge, and except in a few cases we agree with his awards. We hope that another year the Committee will display a little more practical knowledge of their subject as exemplified in the schedule, which was poor and badly drawn. There were four cups: one for *Dorkings*, which brought five entries; *Cochins* bringing six entries; *Game* bringing eleven entries; and *Brahmas*. Now, why these classes should be favoured in this way we do not know, more especially as the same entry was charged throughout. Again, the classes were lumped together in a most unwise manner. *Cochins* should be divided; *Hamburgs* want at the very least two classes, and should have four or five to give any satisfaction; *French* should have classes, also *Polands*; and the *Duck* class sadly needs division, or the beautiful little *Mandarin*, &c., are hardly to be expected. The pens and feeding were commendable; but the entries small, mustering only 110 pens, although in almost every class there were birds of the very highest type.

In *Dorkings* Mr. Parlett secured cup and second with two fine pairs, which are old friends with us. They were good in feet, size, and condition. The Whites could stand no chance, although very fair birds. Mr. Henry Lingwood seems out of form this season. In *Spanish* the hens were better than the cocks, the latter beginning to look anything but "aristocrats." In *Game* Mr. S. Mathew showed three lovely pens. The *Red* class contained four grand pens, the best being Mr. Mathew's commended *Black Reds*; but the Judge preferred larger birds belonging to the same owner. These were *Brown Reds* in grand trim indeed, good in eye, feet, and style. Second contained we think the Croydon winner, a fine strapping bird he is; but the hen was not so good. The commended *Brown Reds* (*Martins*) were a lovely colour, but too square in tail. In *Duckwings*, first, which took the cup also, were a lovely-coloured pair of *Duckwings* in nice order, but not so shapely as the *Reds*. The rest were only moderate. *Cochins*, a poor lot, were headed by a well-known pen of *Buffs*, the cock being the same which was disqualified at Croydon. This pen has had a pretty fair spell of exhibiting lately and needs rest. The rest were all poor. *Dark Brahmas* were a larger class, first going to Mr. Lingwood's Croydon cup cock, with a moderate hen; the second being very moderate, in fact with one exception a pen we would have placed second. The whole class remaining was poor. *Lights* were a much better lot, the winning pens being first-rate, good in body, colour, comb, and feather. The commended pens each contained good individual specimens. The *Hamburgs*, any variety, were eleven pens; first were *Gold-pencils*, the hen a

gem, but the cock fair only; second were Silver-spangles, cock first-rate and in fine trim, the hen only moderate. Pen 62 (Tucker) were nice Gold-spangles; and 63 (Harris) Silver-spangles. In Game *Bantams* first were richly-coloured stylish little Piles; they would be better with less tail. This applies also to the second Black Reds, which were stylish, but heavy in the caudal appendage. In the fancy Bantam class Blacks of rare quality were first and fair Japanese second. It is something novel to see Blacks beat Silver Sebrights such as Mr. Leno's crack pen, but we can scarcely understand Japanese thrashing them. In the Variety class first and second were Crêves and Houdans, the latter with Crêve combs. Mr. Hewitt insists upon the Houdan comb on the Houdan. Which is it to be? The highly commended pair were Black Malays, which we much admired. *Turkeys* and *Geese* were fair classes only.

**DORKINGS**.—1 and 2, F. Parlett, Gallewood, Chelmsford. *she*. — Everett & Stratford.

**SPANISH**.—1. — Chilcott. 2. — Waller. *he*. — Thomas.

### FULFORD (YORK) SHOW.

The annual Show of poultry and Cage Birds took place on the 15th inst. The poultry, &c., were arranged in the open field in pens belonging to the Society, which we, however, recommend to be changed for some of a more modern kind.

*Spanish* were first, and only poor; but the *Dorkings* were fit to grace the best of shows. *Brahmas*, *Cochins*, and *Game* only of a poor quality, with the exception of the first-prize pens. *Hamburgs* had but two classes, and in that for Golden Pencils won both prizes; a pen of Spangles highly commended were good, but the cock's breast was very much laced. *Silvers* were poor. In chickens of Any breed the first were three very promising Black Spanish cockerels, and second a pen of Light Brahmas of fair quality, a pen of Brown Red Game—too young however—being very highly commended. In *Bantams* first were Black, and second Silver Sebrights. *Turkeys* were very good, but the pens were too small. In *Ducks* a pretty pair of Teal were first, and Aylesburys second.

*Pigeons* were well shown, the best four Carriers taking first, and a mixed lot second, two of the latter being also Carriers, a Priest, and an Owl.

In *Rabbits*, as might be expected, were good representatives. In Lops a very large Fawn doe was first, a Fawn-and-white buck second, and a Black doe third. In the Variety class first was a capital Angora, second a handsome Silver-Grey, and very highly commended a Belgian hare, the rest of the class being good.

The great feature of the Show was the *Cage Birds*, which were shown in the floral tent, and a nice display they were, fifty-six in all. In the Clear Yellow of 1876 the winners were nice promising Norwich, which were putting-out here and there a stray shoot of high colour. No. 1 was left out being ticked, and No. 4 as presenting the appearance of too rapid a moult in one particular place. In Buffs were also some nice specimens, and all were noticed. The rest of the classes were for birds of any age. In Evenly-marked Buff or Yellow the first was a good Yellow four-pointed bird, rather heavy in eye marks; second also Yellow, was not perfectly even. No. 16 (Petty & Cuss) was disqualified, the secondaries of the left wing having been coloured to match the other, and we must admit it looked well; but we would advise that it be shown in the Extra stock as a specimen of the artistic skill of the exhibitor. Cinnamons won both prizes in the Variety class, a young Lizard with a slightly irregular cap being very highly commended. The Crested were a fair class, the first a Yellow with very even crest, though not large. Cage of four Canaries were mostly young birds of this year, and were not of high merit. Goldfinches were good, very good indeed for the time of year. In Goldfinch Males a good Mealy four-pointed bird was placed first, a Dark Mule of very high colour being second; two other highly commended were light variegated. Bullfinches were very good and in fine bloom, and Linnets showed great care and nursing, the two winners being in faultless condition and feather. In Extra stock were two of the circular cages attached to musical boxes, the birds, which were powerful-built Greenfinches, plying their calling very actively.

**SPANISH**.—1. J. T. Hingston, York. 2. T. P. Carver, Boroughbridge. *he*. G. Founder.

**JUDGES**. — Mr. E. Hutton, Pudsey.

### SNAITH POULTRY, &c., SHOW.

The twenty-first annual meeting of the Snaith Agricultural Society was held on July 8th in the beautiful grounds kindly lent by Mr. J. H. Rooket. For the accommodation of the poultry and Pigeons a spacious marquee was provided, and Turner's pens completed the arrangement, these being well placed for the purpose. The list was a great improvement upon any previous one offered by the Society, and the results fully bore out the wisdom of this step, the entries being in all respects satisfactory.

*Game* fowl were not good, if we except the winners in the Variety class, which were Duckwings, while *Spanish* were very good, and for the time of year in nice feather. In *Cochins* the first were Whites, the hen a grand bird; the second Buffs, the hen also good, but both cocks poor; the third a fair pen of Fartbridge, though the cock had too much hook. Both classes of Spangle *Hamburgs* were very good, and the Pencils as far as regards the winners, the remainder being poor. Both White and Coloured *Dorkings* were good; in the latter class Silver-Grey were second, Dark Greys taking the other prizes. Of Black *Hamburgs* there were but three pens, but these were very good. *Bantams* were well provided for but badly classed, and a revision of this section would be of great use. A class for Duckwing *Game* was first with three pens of fair quality; next was one for Any other variety of *Game Bantams*, in which a smart pen of Piles were first, Brown Reds second, and Piles third. In cock and hen not *Game* the winners were Black and very good. After these came Black Red cocks, in which the first was a grand stylish bird; the second had a better tail, but lost in colour, limb, and carriage, and was minus one sickle; the third was good, but the wings were a little drooping. Hens of that variety were the best of the Bantam classes, the first going to a most perfect pullet, and second to a hen perfect in colour and in nice order, two other excellent hens receiving high commendations; one of these, a very old bird, had such a head as is rarely seen. Of *Brahmas* there were only four pens, the first only being good. Cock and hen of Any other variety produced Silver and Gold Poland and Black *Cochins*, the Polands being very fine. In both Selling classes Crêve-Cœurs were first, *Spanish*, Black *Bantams*, and *Game* dividing the other prizes. In *Turkeys* the best were Blacks, and in *Geese* Grey; the *Ducks*, which were Romans, being good, but out of feather. Guinea Fowls were one of the best classes we have seen of late. The whole class was highly commended.

*Pigeons* were a very even lot. Carriers were divided into two classes. In cocks the first was Dun and second Black, both good. In hens the first was Black, and second Dun; a grand Black was highly commended. In Tumblers the winners were Almonds, the first a cock and second hen, the latter good in head properties, but only moderate in colour. Jacobins were a grand class, every pen being noticed; the first and second Red. Posters also all noticed; the first Blue, but not in the condition we have seen him; second Black; and a third was awarded to a capital White. Turbits were very good. The first-prize Red was about perfect, the second was a Shell-crowned Silver, and all the rest noticed. Fantails were very good, but in Owls only the winners were of any use, the first Silver and second Blue.

Barbs were a good class. A Black cock of good properties was first; and second a Dun very short in beak, but not equal in eye to the highly-commended Black. Magpies were very good; both the winners Reds. In Dragons the first was a most perfect Blue cock, and second a Red, a capital Yellow being also noticed. Antwerps were a good class, the first the style of bird which has been long looked for—Silver, Dun, and Short-faced in reality; the second was a medium-faced Red-chequer hen; a good Short-faced Red-chequer was very highly commended. In Any breed not before named the first were a pair of Pigmy Pouters, second Nuns; both very good. Two Selling classes wound up this section, some of the pens being very cheap lots.

Of Rabbits there were not many entries, the prizes being poor, but the winners were well worthy of better competition.

**Cage Birds** were shown in the floral tent, and looked well among the flowers. The first class was for "English Canary," whatever that may be. A very good Variegated high-coloured Norwich was placed first, the second going to a good four-pointed Yorkshire, a very well-made Dark Variegated Yorkshire being very highly commended, other commoner-coloured birds coming in for high commendations. Belgians were very poor, Bullfinches and Goldfinches good for the time of year, and the Linnets in nice order. In the Variety class the first was a capital King Parrot, and second a five-pointed Goldfinch Mule, a Snow Bunting in nice order being very highly commended. The whole Show was very well managed, and we congratulate the Secretary upon the success of this section particularly.

**GAME**—Black or other Red.—1, J. B. Hepworth, Haggins Carr, Hatfield. 2, Julian, Beverley. 3, F. Sales, Grouse. Any other variety.—1, F. Sales. 2, J. A. & H. Staveley, Tibthorpe, Driffield. 3, M. White, Stapleton Park. **SPANIELS**—Black.—1 and 2, H. Beldon, Gostotock, Singley. 3, J. Powell. **COCHIN-CHINA**—1, H. Beldon. 2, J. White. 3, W. P. Fletcher, Ackworth. **HE**, T. Addey, Askern; —Bleasby, Hambleton. **C**, —Tarton, Ackworth; —Bleasby.

**HAMBOURGERS**—Silver-spangled.—1 and 2, H. Beldon. 3, Walls & Sherwin. **GOLDEN-SPANGLED**—1 and 2, H. Beldon. 3, J. & W. Kellitt, Ouse. **HAMBOURGERS**—Golden-pencilled.—1 and 2, H. Beldon. 3, W. Harrell, Hensale. **SILVER-PENCILLED**—1 and 2, H. Beldon. 3, W. Harrell. **HAMBOURGERS**—Black.—1 and 2, H. Beldon. 3, J. & W. Kellitt. **DORKINGS**—White.—1 and 2, W. Morrill, Goolia. 3, W. H. King, Mansfield. **ROCHDALE** Coloured.—1 and 2, W. Morrill. 3, W. Rowe. 4, W. H. King. **HE**, J. H. Rookett.

**BANTAMS**—Game Duckwing.—1, C. & F. Newbitt. 2, W. F. Entwistle, Westfield Wyke, Bradford. 3, E. Dawson, Epworth. Any other variety Game Duckwing.—1, E. Dawson. 2, W. F. Entwistle. 3, F. Holt. Any variety not Game.—1, Walls & Sherwin. 2, H. Beldon. 3, T. O. Newbitt. **BRAMBLING**—1, W. Whitely, Sheffield. 2, Mrs. B. Frank. 3, J. Vollans, Selby. **ANY OTHER VARIETY**—1 and 2, H. Beldon. 3, Mrs. B. Frank. **GAME BANTAMS**—Black Red.—Cock.—1, W. F. Entwistle. 2, A. Sugden, Cleckheaton. 3, Master E. D. E. Elmtree, Epworth. **HE**, Walls & Sherwin; E. Dawson. **HE**, 1 and 2, W. F. Entwistle. 3, A. Sugden. **HE**, J. Croxland, jun.; W. Ewbank, Carlton; W. W. Hudson, Epworth. **C**, Mrs. Dale; —Jabes, Clifton; T. Sales.

**ANY BREED**—Cock.—1, H. Beldon. 2, F. Sales. 3, J. B. Hepworth. **HE**, Mrs. B. Frank; T. Addey.

**SELLING CLASS**—Not to exceed 4s.—1, T. Addey. 2, J. Powell, Bradford. 3, Bruch & Boulter. **C**, W. Morrill; H. Beldon. Not to exceed 5s.—1, Walls & Sherwin. 2, —Jabes. 3, T. Addey. **TURKEYS**—1, Mrs. J. Braithwaite, Hadfield. 2 and 3, J. H. Rookett. 3, Mrs. Lambert, Sherwood.

**GENE**—1, J. White, Netherton. 2, J. B. Hepworth. 3, C. Young. **DUCKS**—1, B. Parkinson, Dewsbury. 2, J. White. 3, C. Young. **GOOSE**—1, J. H. Rookett. 2, G. Cooke, jun. 3, C. Young.

#### PIGEONS.

**CARRIERS**—Cock.—1 and 2, E. Horner, Harewood. **HE**, J. E. Crofts, Blyth, Workop. **HE**, Yardley, Birmingham. **HE**, —1, J. E. Crofts. 2, E. Horner. **HE**, H. Yardley; E. Horner.

**TUMBLERS**—Cock or Hen.—1, H. Yardley. 2, E. Horner. **HE**, Walls & Sherwin.

**JACOBINS**—1, T. Holt. 2, E. Horner. **HE**, J. E. Crofts; T. Holt; E. Horner. **C**, Walls & Sherwin; J. Shillock, Oulton, Hossingham.

**POUTERS**—1, J. E. Crofts. 2, Miss F. Seanoor. 3, A. Spencer, Driffield. Whole class highly commended.

**TURKEYS**—1, Miss F. Seanoor. 2, J. E. Crofts. **HE**, W. Fowler; E. Horner (3). **FANTAILS**—1, F. Liveridge, Newark. 2, J. Walker, Newark. **HE**, J. Walker; J. F. Liveridge; W. Fowler; E. Horner.

**OWLS**—1, Miss F. Seanoor. 2, H. Yardley. **C**, F. Tomlinson.

**BAKES**—1, E. Horner. 2, J. E. Crofts. **HE**, W. Fowler.

**MAGPIES**—1, E. Horner. 2, J. E. Crofts. **HE**, F. Tomlinson; Miss F. Seanoor.

**DRAGONS**—1 and 2, H. Woods, Mansfield. 3 and 4, Walls & Sherwin.

**ANTWERPS**—1 and 2, W. F. Entwistle. 3, Miss F. Seanoor. **HE**, J. Croxland, jun. **C**, J. Croxland, jun. (3); E. Horner.

**ANY OTHER VARIETY**—1, Miss F. Seanoor. 2, E. Horner. **HE**, H. Yardley. **C**, Walls & Sherwin.

**SELLING CLASS**—Pair.—Price not to exceed 4s.—1, H. Yardley. 2, J. E. Crofts. **HE**, E. Horner. **C**, J. Croxland, jun.; Walls & Sherwin. **Cock or Hen**.

—Price not to exceed 2s.—1, E. Horner. 2, A. Spencer. **C**, W. Fowler.

#### FANCY BIRDS.

**CANARIES**—English.—1, E. Lesson, Middlesbrough. 2, T. Ballance. **HE**, W. Taker, Goolia; G. Morris, Todmorden. **HE**, J. Meggit, Snaith; W. Gravill, Thorne; W. Cawthorne, Cowick; J. Widdop, Snaith; J. Wright, Snaith.

**Belgian or Foreign**—1, Master H. Buck, Goolia. 2, T. Ballance.

**BULLFINCH**—1, E. Lesson. 2, J. W. Walker. **C**, —Mitchell, Goudall.

**GOLDFINCH**—1, A. Ross, Selby. 2, J. W. Walker. **HE**, E. Lesson. **C**, G. Morley, Barlow.

**LINNET**—1, E. Lesson. 2, J. Coultas, Snaith. **HE**, H. Mitchell, Goudall. **C**, J. W. Walker.

**ANY VARIETY**—1, W. Clarke (King Parrot). 2, G. Trimmingham, Wormley Hill. **HE**, W. Clarke (King Parrot). **HE**, E. Nelson, Camblesforth; T. Ballance.

#### RABBITS.

**LOP-EARED**—Buck.—1, J. M. Mander, Wakefield. **Doe**—1, J. M. Mander.

**ANY OTHER VARIETY**—1 and 2, J. Hallas.

**JUDGES**—Mr. W. Cannan, Bradford; Mr. G. Hutton, Pudsey, Leeds.

**THE ROCHDALE AGRICULTURAL SHOW**, including Poultry, Pigeons, &c., is announced to be held on August 18th in the grounds of C. M. Royd, Esq. There are already, we understand,

a considerable number of entries, and a good exhibition is anticipated.

#### JACOBINS.

For many years Jacobins have been as far beneath the standard of the old fanciers as either Trumpeters or Owls. What "WILKINS RACON" so happily terms the "Baldhead style" has been in the ascendant—a poor thing, with an apology for a hood on the back of its head, or rather on the upper end of its neck, and then laid flat, and if it did not lie flat enough it was assisted by cutting away the feathers beneath. This made the bird look so like a Baldpate that at a short distance I have actually mistaken the one for the other in a badly lighted loft. Then they have the mane—one of the greatest faults a Jacobin could have; birds with it look as if the feathers on each side of the neck had been blown aside and remained so, with the so-called mane running up between those holes. This mane had also another bad effect, as of course it runs up and joins the hood in a point, and so causing an angular appearance in the hood which has again to be touched up to make it circular. The birds were beside coarse in head and beak, and large in body, with thick shoulders, so that many could not be handled easily unless both hands were used. They were also short in flights and tail, and of course short in the feathers of the hood and chain as well. This is one of the greatest faults a Jacobin can have.

But all these defects seem to have been overlooked, or rather turned into beauties, provided the bird had pearl eyes, as if this was the chief property of a Jacobin. This eye is no doubt desirable, and adds to the beauty of a bird if fine in other properties, but ought not for a moment to come into competition with fine head, hood, and chain, thin shoulders, and length of feather; obtain these, and then the proper eye will follow. It will be much easier to secure than the other points.

The best specimens of the old Jacobin were very slim in girth, with long flights and tails, and fine heads and beaks, and the feathers of a soft silky texture all over. Birds of this style had the hood and chain much better developed than in the modern show Jacobin. The hood was upon the head and thrown well forward, so that it really formed a hood. I have seen a Red Jacobin so good in this respect that when looked at in a side or profile view only her back was visible. She could not be flown until part of her hood opposite each eye was out away in order that she might see her way. Of course even then such birds were not common, but this was not wanted. Such birds had no mane—an abomination, but of course it came; in fact was too easy to obtain. It looks as if the new school had decided to make it a property, as well as the flat hood. Instead of the mane the feathers round the back of the head were nicely divided all round, and so forming the hood into the proper circular shape.

How the show Jacobins of the present day have come to be believed in can only be accounted for by the fact that fanciers for many years have not had it in their power to see many of the best style of birds, or, if they saw them, were told by those who professed to be judges that they were not show birds, and therefore not to be thought of a second time. But the tide will turn, and has indeed shown signs of so doing from what I have observed at shows within the last year or two. That this will continue I fully believe, as every experienced thinking fancier will agree with me in saying that such a bird as the old Jacobin is much more difficult to breed than the other, and much more preferable in every respect when bred.

The great distinction is, the old Jacobin had a genuine hood and wore it. The modern bird has a poor hood thrown down to the back of the neck as if they were ashamed of it, or perhaps to give a better view of their faces—not so pretty certainly as to court inspection in such a barefaced manner.

I know that I shall have a host of Jacobin fanciers down upon me for such heresy as they will deem it; but this I do not mind, I am sure there are yet a few fanciers in the flesh who recollect such birds as I describe, and who could if they chose bear me out in all I have said. As to colour, I think Reds have been the best, Whites are pretty, but are always short in the feathers of the hood and chain.—G. UZZ.

#### BELGIAN CANARIES.—No. 2.

In continuing my remarks respecting Belgian Canaries I might enumerate instances where birds of exceptional merit have been exhibited—one in particular, a noted Buff cock, well remembered by some of the Belgian fancy as having been shown in the youthful days of the Crystal Palace bird show. If I mistake not the bird was exhibited three or four years in succession, the last time at the Palace Show being in the year 1863, when the bird had attained the age of five years. On each occasion the bird was awarded first honours. The repetition of the performance year after year, and the age of the bird (for Belgian Canaries rarely live to the age of five years as exhibition birds), may be considered a very exceptional instance, and worth recording. The famous Buff cock was the property

of a gentleman in the city of Durham, who also prided himself in exhibiting (about the same period) some exceedingly fine specimens of the Goldfinch and Canary Mules.

Sixteen or eighteen years ago All-England Bird Shows were not known much of, but still at the earliest of them the Belgian Canary always held a prominent position; but of late years the Norwich Canary having come so much into favour, and being generally cheaper than Belgian birds, breeders of the latter kind have become few and far between.

Most of the choicest Belgian Canaries are annually imported by dealers and others into this country from Belgium. The high prices asked place them beyond the reach of most fanciers. The consequence is they are more scarce than other kinds, are less robust in constitution, and even when some enthusiastic speculator with "Belgian on the brain" loosens his purse strings and sets himself up with a pair of high-class birds, ten to one he may at the end of the breeding season have nothing to gratify him beyond a solitary specimen to recoup him for his outlay, and he may think himself fortunate if he succeeds in nursing the old or parent birds through the moulting sickness.

The expense and trouble of breeding and rearing is a drawback to the Belgian fancy, but I have always considered that there is more credit to the fancier who can breed, exhibit, and win, than to those who have to purchase stock year after year for exhibition purposes.

The best breeders in Belgium promote principally the breeding of clear birds, not favouring so much those marked or variegated, which are produced through crossing-in with dark-feathered birds of inferior blood. It is only occasionally that even-marked or variegated birds are found to possess the essential Belgian points which characterise clear birds. Not so, however, with those dubbed or known as ticked Belgians, many of which are equally as good in points as clear birds; in fact, the ticked birds are invariably bred from clear stock. As with Norwich birds, ticked or marked specimens will now and then crop up; but in breeding Norwich birds the practice of crossing-in with the green is very common. It is done chiefly for upholding colour.

Were it not that at many shows the classes for Belgian birds are much less patronised than other kinds there would, as for the Norwich breeds, be six classes wherein the birds could be entered—viz., two for clear, two for ticked, and two for even-marked. In some instances the clear and ticked classes are combined; and in other cases, where committees have to "cut according to the cloth" the Belgian birds are included in one class—thus, "For the best Belgian bird."

No intending bird-breeder should commence the Belgian fancy without having made himself master of the ins and outs of the practical management of other kinds of Canaries. Having so fortified himself he will be more competent to manage them. Belgian birds, being of a delicate breed, should not be handled more than is absolutely necessary—such, for instance, as clipping their claws, which should not be allowed to grow into a sickle shape, and also for otherwise keeping them from becoming crippled through being clog-footed. The compartments or cages in which they should be kept should be of good size. Belgian Canaries are very easily taught to run from one cage to another by the aid of a small wand or cane, which should be held over their heads, ever directing them to the doorplace through which it is intended they should make their exit. Such lessons should, if possible, be taught them during their youth, and always during the daytime.

Yellow Belgian birds generally are more racy in appearance than Buff birds, but they are apt to be a little more faulty; for although possessing smaller heads, thinner necks, and being better braced-up in feathers, still they show more hollowness betwixt the shoulders, and are often disfigured with tails inclined to project outwards instead of dropping in close proximity to the perch, and the half-circle being continued from the shoulders down the back to the end of the tail. I look at the above defect as a grave one in a Belgian bird, and the heavy shoulders somewhat lose effect unless thorough Belgian position and form predominate. The mere fact of a heavy-backed bird balancing itself upon its stilts is not good enough for the eyes of a thoroughly qualified judge of Belgians.—Geo. J. BARNABY.

### THE CUCKOO.

WITH regard to "our friend the Cuckoo," without questioning his friendship or utility, allow me to inform you and your readers who are desirous of information on the subject that he does eat birds' eggs; that whilst birds' eggs are to be found they are his main food; that as these become scarce he takes to less dainty diet; that I have when salad, fond of birds'-nesting, found him more than once in the act of eating the eggs; and that he is not over-particular as to their freshness, having no objection to the chickens in them. It is a curious fact that the female Cuckoo does not eat the eggs from the nest in which she deposits her own. I never found more than one Cuckoo's egg in a nest with other eggs, but I once found a female Cuckoo dead upon

the nest in which she had deposited her own egg, having crept into a faggot for the purpose from which she could not return.

While on natural history, I may just mention that I have seen it stated with authority that Starlings do not eat fruit. I have known a large Cherry tree with at least a hundredweight of Cherries upon it, cleared in a single morning before I had taken my breakfast by flocks of Starlings. They attack the Cherry trees in countless thousands for their fruit.—J. GASS, M.R.C.S.E.

### DARI.

A QUESTION was asked a week or two ago by one of your correspondents, What is dari, and where can it be procured? I have anxiously looked for a reply, but all I have seen—i.e., Mr. Elgar's letter, only tells as to its value and effect. Will someone say where it can be bought? No corn-chandler about here knows anything of it.—H. G. W.

[This is Indian millet, and ought to be procurable of any corn merchant.]

### BEES IN IRELAND.

I, in compliance with request from "B. & W." in your last week's number, forward a report of my bees for this season up to 1st July, and you will see that word for word it agrees with "B. & W.'s" experience. I may be permitted to say that anything signed with the above initials I have a high appreciation for, as the matter comes from an experienced apiarian, at least so I judge, without in the least knowing who "B. & W." may be.

#### REPORT OF BEES.

Locality, Co. Wicklow.

Pasturage, grazing land, with abundance of white clover and splendid lime trees.

Stocks, all unusually strong in ten frame hives.

Weather, cold and wet during May and June, with bright days at intervals.

Honey, not an ounce in the supers, and hives as a rule light. By same date last year I had over 100 lbs. weight in supers, and hives all full.

I find that an early and dry summer is the best for honey-gathering, as although the fields are now white with clover, the bees either do not gather it with the same industry, or else it is not so plentiful in showery weather as during a long spell of hot dry weather.—E. WALPOLE, JUN.

### THE BRITISH BEE-KEEPERS' ASSOCIATION

Will hold their second great Exhibition of bees and their produce, hives, and bee furniture, and honey fair, at the Crystal Palace, Sept. 21st, 22nd, and 23rd, 1875. The schedule is comprehensive and the prizes are liberal. There are classes for hives, bees, honey, cottagers, comestibles, &c.

HONEY FAIR.—In addition to the prize exhibition, a distinct counter will be appropriated for the exhibition and sale of honey in comb and in glasses, and in this department sales will be permitted and goods delivered at all times during the Show. The Association will provide salesmen. All money must be paid through the hands of the clerk in attendance, and will be afterwards accounted for, less 1d. in each shilling for commission. Every exhibit at the sale counter must have distinctly marked on it the weight and the price, which must include the package which contains it. The Association will not undertake to break bulk.

No exhibit entered for competition will be allowed to be removed until the close of the Show.

Every intending exhibitor must register his name with a fee of one shilling (which shall be the entry-fee for one exhibit in any class) by September 1st; any additional number of entries may be afterwards made on or before September 15th on payment of an additional fee of one shilling each. The amount of counter space that will be required for the exhibits must also be stated.

Each exhibitor and member may have a ticket of free entry to the Show on application to the Hon. Sec. prior thereto. Donations in aid of the prize fund will be thankfully received.—JOHN HURTER, Hon. Sec., Eaton Biss, Ealing, Middlesex.

### ITALIAN SWITZERLAND.

In my rambles last summer I visited the Lago Maggiore, and made a short stay in the Canton of Tessin. I hoped to have gained much information relative to bees, but not understanding Italian I could do but little among the natives. I found out, however, that the demand for Italian bees was a good thing for the bee merchants. "Mercanti d'api," as they are called, who, I soon learnt, carried sharp stings. I do not know that this propensity is confined altogether to that part of the world, for even here in England the rival authorities on bees like to sting each other at times.

At Bellinzona I met with a bee merchant named Chevalley, who told me that he sent colonies of bees as well as queens to various parts of England and Scotland. He has a large stock of bees in various parts kept principally for exportation. Those which I saw were all in rudely-constructed wooden boxes on the bar-frame principle, peaked one upon the other like a wall with a round hole in front, but no landing-board; each box opened by a door at the back, the frames ranging from side to side; being in a shed access to them was from behind. In examining the bees Chevalley opened the door and puffed in a little tobacco smoke from a short pipe, then took out frame after frame until he found the queen, his wife assisting him so that they overhauled them with as much indifference as if they were looking over so many Pigeons' nests, which highly amused my wife, who could not understand why they were not stung; and when asked the reason Chevalley said, "My bees are good, very good." We spent a very pleasant day with this gentleman and his wife, and left them with much regret so soon. I still have to learn how people at a distance think so much of Italian bees, for in other parts of Switzerland they seem to prefer the black bees.

Being on a voyage of discovery I learnt many things about the people which puzzled me not a little. The principal beast of burden seems to be the woman. Go where you will in highways or footpaths you meet the women and even young girls carrying the hotte. This hotte is like a large tub strapped on the back in which they carry everything; manure to the field and the produce home all is done by the woman. It is not uncommon to see them carrying live pigs to market and again loaded home with what they require, not only for themselves but for their neighbours, also the husband walking by their side carrying nothing but a large umbrella. I asked, Do the men do nothing? I am told very little besides smoking and chatting to each other at the public houses. The higher classes also live an indolent life. The men will turn out of bed at ten in the morning, go to the café or gossip about, backbiting each other, returning home, perhaps, at two in the morning. Many of them never see their children for weeks together. They are very fond of litigation, so that there is plenty of work for the lawyers; so much is this the case that a stranger might think there was not an honest man in the country.

I inquired further how it was there was no game to be found anywhere, neither for sport nor diversion; on the other hand, they take care that a small bird shall not live. Every kind from the Swallow to the Nightingale can be purchased in the markets for 6d. per dozen, so that two small birds and 2 lbs. of polenta costing 8d. will make a meal for a family. Even in this they do not kill the birds for sport—powder and shot is too dear, but take them in nets and traps. Thousands of innocent song birds are taken every year on the margins of the Italian lakes. The principle which seems to guide these people is to make the most of everything, while that which requires care in keeping is neglected. Poultry, Pigeons, Rabbits, Turkeys, Ducks, and Geese are hardly known. Horses, asses, and mules are only kept for travellers, few keep them for pleasure or even for labour. As to cats and dogs, they are hunted for sport, the former taken, which they prefer to Rabbit. In fact, they seem to abhor every kind of animal. When asked why it is so, they say they do not know, except they have not been accustomed to keep them.

A farmyard such as we have in England is unknown here; the incessant noise made by every species of animals, as the barking of the dog, the neighing of the horse, the braying of the ass, the crowing of the cock, the hen's call to the chicken, the cooing of the Pigeons, &c., is heard nowhere. All this merriment is not heard anywhere in the Canton of Tessin. I forbear to enlarge on this subject, but should like the opinion of other travellers if all this be true.—JOHN CARPENTER, *Brentford*.

**GOAT SHOW.**—The Crystal Palace Company intend having a show of Goats, to commence on the 24th inst., and being the first exhibition of the kind they hope to have a large entry. There are twelve classes, and liberal prizes are offered.

### OUR LETTER BOX.

**TAKING A LARGE SUPER (W. J. Hebbelshausen).**—We find no difficulty with Aston's bee trap, but can imagine a very large super such as yours requiring different treatment. We should have driven out the bees on mass first, and then used the trap to get rid of the remainder. It is not probable that the queen was in your super, in which case there would be a difficulty in dislodging the bees. Tobacco is a bad fumigator, and, indeed, all fumigating of bees is to be avoided; it makes them sick, and afflicts them with diarrhoea, which is not agreeable in a fine super of honey.

**WOODLICK IN SUPERS, &c. (F. M. M.).**—1. You can get rid of the woodlice by closing the space by which they enter. A little clay or other plastic substance plastered round will keep them out. 2. We hardly advise your suggested method of joining the bees, after taking the super, to the swarms in the rough bar-frame hive. You had better wait till a few days before you leave home, then drive the bees of both hives, and unite them by dabbing both of the populations down together in front of the bar-framed hive placed at hand on the ground. They will enter it together peaceably enough, one of the queens, of course, being sacrificed. Should there be any brood worth saving you can separate it from the rest of the comb, arrange it in a super,

and place it over the bar-frame hive for the bees to hatch out. Some of the bees will doubtless fly back to their old stand for some days, but will mostly return to the bar-framed hive.

**LEGUMINISING A HIVE (G. W. Jessop).**—We fear you have cut out for yourself a treatment of your bees beyond the powers of a beginner in bee-keeping. You can easily procure a pure-bred queen from any advertising salesman, as the Messrs. Neighbour & Sons. She will be, or ought to be, a fruitful mother, and can dispense with drones till swarming time next summer; but you will have to drive your colts to catch the queen. Then the Italian queen must be introduced by means of a queen cage or in some other way; and then comes the greatest difficulty of all—namely, the transferring of the whole to a Woodbury hive. We strongly advise you to wait till next year, as it is too late now to do it.

**CANARY HEN SITTING (Miss Bell).**—We should imagine by this that your Canary hen is again about to commence sitting; it will not hurt her to let her do so, provided she remains healthy. Judging from your remarks we presume she is in robust health, and will maintain her "good condition" for another fortnight or three weeks ere she commences to moult, although at this particular juncture many Canaries are commencing to cast their feathers. If such had been the case with the pair you are breeding from, we should have said, At once remove the nesting materials. All Canaries do not fall into moult at one time, for much depends upon constitution and the even temperature and way they are treated. You have done well towards the birds there is little doubt, and in return for your kind attention to them they have presented you so far with a goodly number of young birds. May they afford you still further pleasure with their harmony. If in the two earlier nests a chick was reared from each of the five eggs laid, with an additional couple reared from the third nest, you may consider yourself somewhat fortunate, for the rearing of a dozen young ones by one pair of birds over three nests is beyond the average. It is so far satisfactory for you to be able to account for the loss of three of the birds out of the five in the third nest. It is very often the case that young birds will die in the nests without the means of arriving at the true cause of death. Evidently the parent birds are kind and attentive, and if you continue your attention to them during the moulting sickness, and befit that and next April, most probably you will be equally successful with them next breeding season. We will assist you with our advice if needed. The changeable weather we have experienced during the past few days will very much affect Canaries and other cage pets, and speedily throw them into the moulting sickness. This becomes a natural consequence when following a period of heat. At the time we write our thermometer in the open air records 58° of heat only, with a strong breeze blowing from the north-west—cool enough certainly for July, and reminding us of our own feathers or covering.

### METEOROLOGICAL OBSERVATIONS,

CANTON SQUARE, LONDON.

Lat. 51° 30' 45" N.; Long. 0° 8' 6" W.; Altitude, 111 feet.

### REMARKS.

- 7th.—A very pleasant though rather cloudy day; storm-like at 5 P.M., but fine afterwards.  
8th.—Rather cloudy all day till the evening, then very bright.  
9th.—Fine early, but soon clouding over, and then rain more or less all day, and at times very heavy rain.  
10th.—Till noon cloudy and cold; very fine afternoon and evening, but rain before midnight.  
11th.—Fair early, but rain-like and windy; showers in the afternoon of the day; a fine rainbow about 6 P.M.  
12th.—Fine all day; at times very bright but windy, and cold for the time of the year.  
13th.—Very bright till noon, after that time cloudy; a few drops of rain about 7 P.M.

The nights much colder than last week, the days have many of them been cloudy with frequent showers, so that it has been far from a pleasant week.—G. J. SYMONS.

### COVENT GARDEN MARKET.—JULY 14.

VERY heavy supply of bush and standard fruit, Cherries especially, which are making very low prices, the bulk having been much injured by the late stormy wet weather. The quantity of English Pines sent in now is far in excess of the demand, West India fruit very good and cheap this season. Hothouse Grapes ample, inferior fruit selling at 1s. to 2s. per pound. An average amount of business is current among the dealers. French goods being in fair request.

From observations taken near London during forty-three years, the average day temperature of the week is 73.9°; and its night temperature 50.8°.

## WHEN TO PLANT.

PERHAPS I had better begin by telling my readers when not to plant—viz., when there is little or no root-action, as in midwinter; secondly, when evaporation is excessive, as at midsummer, unless means can be found to check evaporation till such time as the wounded roots are healed sufficiently to absorb an ample supply of moisture. If I were obliged to choose between these two extremes I should certainly for most plants prefer operating at midsummer; for then, if the work is carefully and quickly done on a day when the atmosphere is not deficient of moisture, root-action recommences in a few hours, I think I might say minutes, and our suspense is very short indeed, for then if a blank should occur we can for certain fill it up in October. Those who have not been obliged by circumstances to try midsummer planting would be astonished to see the amount of torture a healthy plant will bear at that time. When making new walks, &c., in ornamental grounds I have had good-sized trees out of the ground two or three weeks during June and July with merely a bit of grass wrapped round their roots, and they suffered very little from it: of course they had good balls, and they were well planted. If there are young immature growths they should be cut back when this can be done without disfigurement. Another plan is to check evaporation by syringing whiting-and-water, or even dirty water, over the foliage. Whiting is best, as it reflects the sun's rays.

I have no faith whatever in syringing outdoor plants with clear water in hot weather, unless it is for the purpose of knocking off insects, and these can be kept off easier, better, and with less injury to the trees in other ways. My own way is to syringe all wall trees subject to insect attacks with soft-soap water, about 2 ozs. to the gallon, once or twice during the growing season. Let those who wish to be fashionable use the celebrated compounds, I am content to be old-fashioned and use soft soap, which is unpalatable to every insect with which a gardener is tormented, including mealy bug. As this last-mentioned formidable enemy has not yet taken up his abode here, I make it a practice of keeping all newly-arrived plants in quarantine for two months, and giving them an occasional soapy bath. When they look at all suspicious, roots as well as leaves are washed. I have had several importations of this detested enemy, but so far, thanks to soft soap and my own clear eyesight (I would not trust any other pair of eyes besides my own), I have been able to kill the animal without materially injuring the vegetable life. Soft soap will also kill mildew on Peach trees much more speedily than sulphur will. The mildew on Roses is harder to kill, but even it will succumb to a tolerably strong dose. It should be applied in the evening after the sun is off the plants.

But my text is "When to plant," and I have not yet said anything about it. Well, the time to plant is as soon as the leaf-growth is fairly matured in autumn, and be-

fore the roots have ceased to grow, while the ground is warm and sweet and in a fit state to be properly worked. Those who recommend spring in preference to autumn planting probably never tried the latter; they are among those who are always two or three months behind in such work as can possibly be delayed, and consequently their autumn planting was done about the same time as their Christmas decorations. Of course that was quite a conclusive trial. Spring planters have had a glorious time of it this year, and of course I am arguing against great odds; but before beginners make up their minds about the proper time to plant, I would ask them to look back two or three years, and compare plants which have been shifted in October and the beginning of November with such as have been planted at any other time.

My advice is, now that the bedding-out is done, Strawberry-forcing over, the forced French Beans with their hosts of red-spider pest out of the way, the Grapes thinned, and we have comparatively nothing to do but keep the birds off and take note of the fruits they peek at first—for these are the best flavoured—lest our minds and brains should get rusty; for the old proverb says, "It is better to wear out than to rust out," that we should at once turn our attention to the trees, and make up our minds as far as possible what we are going to plant, and have it all in black and white. There is no time to do this in large private establishments in the autumn, for generally there are hosts of the *élite* from all parts of the country at our employers' tables, and our personal supervision is required daily for the dessert and floral displays; for we know we are then surrounded by critics, some competent and some of the other sort, and it is always well on these occasions to try at least and satisfy oneself.

Last September I planted over half a mile of ornamental Box-edging; it took less than a third of the time it would take to do in the winter or early spring, because the weather was good, the days not too short, and the soil worked beautifully. My man said, "Narra good to plant un now, measter, the vrost ull haave it out;" but, however, with a little forcible persuasion, it was planted, and the surface of the ground close to the Box was kept loosened instead of remaining firm as it was made up; consequently the frost, of which we had rather more than a sufficiency, did it no injury, and when examined in the spring it had roots 2 inches long, and the top commenced growth as early as that which had not been shifted.

Many people are afraid to move fruit trees before the leaves have fallen, this is quite a mistake. It is best for the growths to be matured, but immature growths can always be cut off, and if the leaves are so numerous as to cause excessive evaporation, and consequent shrivelling of the bark, it is a good plan to thin with the scissors, but not too much, for the more leaves the plant will bear without shrivelling the quicker will root-action commence.

It does not injure a tree a tenth part as much to move it before its leaves are fallen as it does to move it in the spring when its buds are beginning imperceptibly to swell, and its circulation, owing to the absence of vigorous root-action, is sluggish. I moved many fruit trees last October,

including Pears of a good size on the Pear stock, and they can hardly be distinguished now. Such is never the case with spring-planted fruit trees in the first season, and very often they do not really recover at all.

Another reason for amateurs planting early is that the nurserymen cannot plant till amateurs have finished, and consequently the later we defer our planting the less likely are we in future to obtain healthy young trees from the vendors.—WILLIAM TAYLOR.

### STRAWBERRIES AND THEIR CULTURE.

Is it merely a coincidence, or is a good season for Roses always a good Strawberry year? Our Roses have seldom been better; and both from reports in the gardening papers, and from personal observation at the exhibitions of Roses, the quality of the queen of flowers has been much above the average at other places as well.

One cannot say much about Strawberries by noting the exhibitions of this fruit at the London shows, for both the royal societies are piling down the prizes, and the principal exhibitors find it more to their interest to go to some of the provincial towns if the shows happen to be on the same day as those advertised by the metropolitan societies. However, good prizes were offered at the Royal Botanic Society on the 30th of June, and six exhibitors came forward to claim them. In all twenty-four dishes were exhibited. The best was one of *Duc de Magenta*—that is, best as far as appearance went. It is one of the sorts raised by Dr. Nicaise, but, like all the others by the same raiser, the quality is not first-rate.

I have grown a large number of continental sorts, but not one of them can compare in flavour with those raised in England. *La Constante*, *Lucas*, and *Alexander II.* have been grown at Loxford for several years in succession; they have been tried under many different circumstances, both out of doors and in pots forced and unforced, but under no circumstances is the flavour anything like so rich as *Sir J. Paxton*, *President*, *British Queen*, or *Frogmore Late Pine*.

It is very likely that the difference of climate has very much to do with this. In the drier and hotter climate of France, where Grapes ripen on Vines trained as we do Raspberries, the fruit of the Strawberry would in all probability be richer and more sugary as well as firmer in flesh than it would be under our more cloudy sky and moister atmosphere. I must say that the two new sorts selected this year—*Duc de Magenta* and *Auguste Nicaise*, are superior to those sent out previously. Although the flavour is not so good as the best of our own sorts, still they are better than some. For instance, *Admiral Dundas* is very much grown by exhibitors, but it has not one good quality to recommend it except size. The same may be said of *Empress Eugénie*, *Sir Charles Napier*, &c.

This has not been a good season for bringing out the flavour of Strawberries. A soaking rain does good just before the fruit colours if it is followed by hot weather; but it has not been so this year. We had to water before the flowers opened, and also after the fruit was set. Then, just as it ripened we had rain; much of the best fruit was spoiled, and none of the sorts came up to the mark as regards flavour. Even *British Queen* was sadly wanting in its peculiar rich flavour; and the worst of this old sort with us is that it does not bear half a crop. I am sure that five plants of *Auguste Nicaise* or *Duc de Magenta* carried more fruit than twenty plants of *British Queen* or *Mr. Badelyffe*. I name these two together, because they are so much alike that the keenest observer cannot distinguish the one from the other either by leaf or fruit. Like many others it is necessary for us to make the most of our ground; and if *British Queen* alias *Mr. Badelyffe* does not behave better in the future, it will be necessary to dethrone them and exalt others more worthy in their place.

I have a number of seedlings from *British Queen* crossed with *La Constante* and other free-bearing sorts. They are all wonderfully prolific and the fruit is of large size. Many of them are also *Queen*-flavoured. One sort of very dwarf habit has been much admired by visitors. As a pot Strawberry the yield of large even-sized fruit is marvellous. A gentleman well known in the horticultural world carried off a pot with ripe fruit to have it photographed. I gained the first prize with it at the Royal Botanic Gardens last year as a single dish. It was also one of the sorts in the collection of four which was also placed first. This year I again showed it, and it had the highest award. The plant and shape of the leaf is *La Constante*, and the fruit is the colour and shape of the *Queen*.

I am truly glad to report well of Bradley's Amateur this year. It was so bad with mildew both in pots and in the open garden last year that the crop was worthless. If I remember rightly it received a first-class certificate from the Fruit Committee at South Kensington, because the fruit was firm and of good quality in a wet season. My experience confirms this. There were scores of fine fruit on each of the plants, perhaps not one less than a hundred on some of them, and yet I picked a dish from about a score of plants that gained the first prize. I may say here that none of our fruits were thinned out.

Some persons fancy that exhibition Strawberries are gathered from plants that have only produced three or four fruit. Indeed one gentleman of large experience once made this remark to me, "I suppose only two fruits were allowed on a plant." This is quite a mistake, and I do not think that there is much gained by thinning the fruit from Strawberry plants. Let me sum-up the culture in a few words so that busy readers may remember it: Plant annually, trench deep and manure well, and give plenty of water if the season is dry.

It may be as well to just notice the different varieties. *Duc de Magenta* and *Auguste Nicaise* ought to have a fair trial. I do not know if they are much known in the trade yet, and it may save trouble if I state here that I cannot supply anyone with plants; we only grow a few, and when a new sort has been exhibited people send for "just a few runners," and they might think I am wanting in courtesy if I do not send them. I believe Messrs. Veitch of the Royal Exotic Nursery, Chelsea, can supply plants, as their foreman told me they were growing both sorts, or had grown them.

James Veitch I have seen in good condition. I am told that it is one of the best sorts to bear conveyance. It is of large size and fair flavour. Not having proved it under cultivation I cannot say more than this.

*President* and *La Constante* are still trustworthy under all circumstances. *Frogmore Late Pine* is one of the best late sorts. Mr. Laxton of Stamford seems to be raising new sorts, and if he becomes as successful with this fruit as he has been with Peas he cannot desire more.

There is still room for improvement in this as well as all other fruits, but it is working in the wrong direction when size and productiveness are gained at the expense of flavour. It is now time that all the runners are layered, and as soon as they are established in small pots they should be planted out for next season's crop, the strong-growing sorts 2 feet apart, those of more dwarf habit 20 inches.—J. DOUGLAS.

### CUT-BACK ROSES.

I HAVE been intending to write for a long time on the subject of the numerous letters that have appeared in answer to my article on cut-back Roses, but the period of Rose shows is so busy a one that I have not had a moment to spare. Indeed (as most Rose exhibitors will understand), I can truthfully say I have hardly had a good night's rest since the Exeter Show. The Alexandra and Crystal Palace Shows this year were on succeeding days, as also Hereford and Birmingham; indeed, all the Shows were crowded into about twenty days, and the work and care required of exhibitors has been incessant.

In my letter I prophesied how the cut-back Roses would sweep all before them, and I also predicted the great success Mr. Baker would have. Now, he showed entirely from cut-backs, and up to Birmingham was never beaten except for twenty-four distinct varieties at the Alexandra, and there his stand was put in a very unfavourable position, where it had the hot sun blazing down on its unprotected beauties all the day. He was first for forty-eight, thirty-six, and twelve at the Alexandra, and all the amateur classes at the Crystal Palace, and Exeter, and Hereford. In all he has had nineteen first prizes, and would have been grand at Birmingham (where, indeed, he was a very good second for the cup) if the rain had not done him so much damage the day before.

Such is the result, so far as amateurs are concerned, of the Rose shows; and now is it not wonderfully in favour of my dictum, "Stick to cut-backs?" But more than this, as it may be said that in all probability the great majority of amateurs who showed were exhibiting for the most part from cut-back Roses, and so the real issue was not tried. To this I answer that this is a doubtful question, and one difficult to arrive at a correct answer; but be that as it may, I venture to assert that at Exeter the universal opinion was that Mr. Baker's Roses were by far the finest in the Show; and I have been in-

formed that at the Crystal Palace they were much finer than at Exeter, and equal if not superior to those of the nursery-men, whose trees are numbered, not by thousands or tens of thousands only, but by hundreds of thousands.

My friend Mr. Peach, in his capital article in the issue of July 8th, asking for results, wishes to know whether the greater amount of Roses in the amateur stands at the Crystal Palace were not from cut-back Roses. The above will show him that the first prizes in every instance were so awarded, with the exception above named of the class for twenty-four Roses at the Alexandra. "*Experientia docet.*" I was in a large Rose nursery the other day, and I asked the proprietor what he thought of my article on cut-backs, and he answered, "I agree with every word of it, and have proved it over and over again."

I quite agree with Mr. Baker's advice as to growing both maidens and cut-backs in order to have a succession, and I can, alas! bear startling testimony to the value of this rule. This year I have relied entirely upon maidens, and have been nowhere till last Friday, when I secured a first prize at Oxford, and it was not till yesterday (July 13th) that my Roses were fairly in bloom. All the shows were over before I had Roses in bloom. My trees were growing in most wretched soil in a very exposed situation, and the high winds and heavy rains of the first part of June completely devastated them. If it had not been for my Teas and a very few cut-backs I could not have even cut blooms enough for a stand in any class. This was a most fatal mistake on my part, and one I would advise all to beware of. "Never put all your eggs in one basket" is a good rule in Rose-growing; but if you cannot help doing this—*if* from any cause you cannot find room for both, then stick to the cut-backs. Remember Mr. Baker's success in 1875—nineteen first prizes at five shows.—JOHN B. M. CAMM.

### SUMMER PRUNING.—No. 2.

**APRICOTS** are the first to require attention, and the wood of these trees, it is hardly necessary to say, is, as far as the state of the previous wood will permit, laid-in thicker than is practised with any other wall fruit; but even this may be overdone, so that we do not advise the shoots to be laid-in nearer than 2 to 3 inches apart, and only those which have very short joints are to be laid-in at that distance. The stronger shoots ought to be at least 9 inches apart, and between these the short-jointed and weaker wood, as also the spurs, which should not be more than an inch or two long, but from continued growth may have extended considerably. Those must be preserved, also securing the slender shoots to the wall so far as can conveniently be done without crowding. If the shoots of some standing are considerably extended, long and bare, with only a tuft of leaves at their extremities, and not carrying fruit, they may be cut out and others be laid-in in their place. Any shoots required for extension should be laid-in, not having them nearer than 9 inches, and they should be of the strongest description, and nailed-in their full length. Shoots which are not required should be cut back to two or three leaves. This operation is best done with a pair of 4-inch pruning scissors; they are handy, and may be easily carried in the waistcoat pocket. Stronger scissors will be required for strong shoots, they may be carried in the leathern nail-and-shred bag.

From the middle to the end of June, or the early part of July in the north, is about the time Apricots require their first summer pruning. After this the trees should be gone over again at the end of July or early in August, cutting any laterals back to one leaf, and if the strong shoots laid-in far covering space, or the extension shoots have pushed laterals, they should be cut to one leaf, any extension of growth being secured to the wall. About every month or six weeks from commencing to summer-prune, the trees should be gone over, and attended to in stopping and training. It is no use allowing the trees after the first stopping to become crowded with laterals; a few leaves of each successive growth are sufficient to attract the sap and maintain the roots in a healthy, active state, whilst their removal admits light and air to the fruit, and secures in the highest possible manner the maturity of the buds and wood upon which we are dependant for next year's crop.

Cherries will, next to Apricots, demand the attention of the summer pruner. The operator will first see to the extension shoots, and what are required for furnishing; and those being

secured at the requisite distance apart—1 foot for the strong growers, and 9 inches for the moderate growers—and securing them to the wall, will proceed to cut back all other shoots of over 2 inches in length of the current year's growth to three leaves, but not shorten the leading shoots or in anywise interfere with the spurs. It is usual to lay-in the shoots much closer than is named above, and it may be done upon the understanding that they are to be removed when they interfere with the spurs upon the principal branches. If the trees cover their allotted space no shoots will be required to be laid-in, unless, of course, there be vacant space, but they are to be cut back to three leaves, and otherwise treated as foreright or side shoots.

The Morello Cherry is treated in a manner similar to Apricots: All the side shoots available are laid-in, the foreright shoots only being cut back to three leaves, and all shoots not exceeding 2 inches long being left entire. It is a mistake to conclude that the Morello is not amenable to spur-pruning. It bears as well upon close spur-pruning as in the laying-in of the annual growths, which only tends to crowd the trees with wood, and a quantity of it bare, without affording any corresponding advantage over those which are spur-pruned. Being of weaker growth than most sorts, the branches, spur-pruning being practised, should not be more than 6 inches apart.

No tree is so prolific as a pyramid of the Morello Cherry. In fact, all Cherries bear abundantly, especially the Duke and Kentish kinds, in this form on the Mahaleb stock. The operation in pruning bush and pyramid Cherry trees consists in the extension of the shoots suitable for filling up space and forming symmetrical specimens, stopping them to 9 inches; but if only a moderate extension be required stop them to 6 inches, whilst if they be as large as required stop to three leaves—the extremities as well as the shoots upon the main branches. All shoots upon the branches to be cut back to three leaves, but those not over an inch or two long are not to be stopped. If the side shoots are not over 3 inches long they need not be shortened, but left their full length; and the extremity and furnishing shoots not being more than an inch or so longer than the lengths to which the stopping is advised, do not for the sake of removing the extra inch apply the scissors. Always be sure that the extremity bud in each case is formed, for to take off the point of a shoot 10 inches long when we only require it 9 inches, or shorten a 7-inch shoot to 6 inches, is to cut away its, perhaps, only wood-bud, leaving only fruit-buds below, and which after blossoming will drop the fruit in a young state from there being no shoot above or near to support it. Trees of this description need little or no pruning, needing only irregularities corrected, and instead of curtailing the growth they require feeding at the roots. The main branches should be 9 inches to 1 foot distance apart.

Very vigorous trees are to be kept well stopped, but not more than above described. It will to some extent limit root-action, and it will tend to the ripening of the wood; but no amount of summer pruning will bring a very vigorous tree into fruitfulness; its roots must be acted on, for which the stopping is a good preparative.—G. ARBEX.

### SILENE PENDULA.

**AUTUMN-SOWN** annuals for spring decoration play an important part in the decoration of many gardens. This is the best of the spring annuals, but, as is often the case with *Myosotis*, the seed is frequently sown too late to produce plants to give a satisfactory display. Too often are the *Silenes* sown in September with the *Nemophilas* and other annuals, but that is altogether too late. Sown at that period the plants have not sufficient time to become stout before winter, which they should be to flower early and profusely.

The seed should be sown thickly in drills towards the end of July, the seedlings eventually to be thinned out to 6 inches apart. By the time the beds are cleared of the summer plants the *Silenes* will be touching each other, and will take up with large balls after the manner of Sweet Williams and other biennials. Such plants planted closely together in the beds bloom early and profusely, and give such masses of pink that few plants can equal. These stout plants are seldom injured by frost, wet, or slugs, and are as certain to bloom as are the Snowdrops. By directing timely attention to sowing the seed of this the best of spring annuals I shall be doing a service to some who covet a rich spring display, but who, through misapprehension or forgetfulness, would fall into the common

error of delaying to sow the seed until the autumn, and thus invite failure, or at the most only partial success.

*S. pendula alba* is a nice companion plant to the above, and *S. pendula compacta* is very valuable for a front row or for small beds. The *Silenes* are the most certain, effective, and easily produced of all early spring-flowering annuals. Sow at once.—*J., Battersea.*

## ROYAL HORTICULTURAL SOCIETY.

JULY 21ST.

For a length of time the light of the Society has been fading, and was in fact all but extinguished. We had little to do beyond watching the dying embers and to note them one by one mouldering away. At the last Show there was a flickering of life by a special and successful trade effort, otherwise what should have been one of the brightest displays of the year would have been a dreary and dismal blank. It was no wonder that energetic measures were determined on by our representative horticulturists, for to have remained any longer passive they would have invited a verdict of disloyalty to an honourable yet severely stricken cause. But action was taken in an effective manner and to a profitable purpose, of which yesterday we noted the first-fruits. It is a magical transformation from the point of vacuity to complete fulness, from famine to plenty, from death to life. The wet blanket is removed, the horticultural flame is fanned, latent enterprise is kindled into action, confidence is restored, and the first conditions of future success are provided. We trust that now is laid the foundation of national horticultural prosperity, and which will culminate in the Society achieving a position of the first rank, to be honoured and respected at home and abroad. Neither will this be a success of a mere section, but a success which will obliterate sections, and show that the advantages of what are known as the local and horticultural interests are more nearly identical than class-partisans dream of. We would merge all classes and unite all resources, bury the past and look only to the future—know nothing, indeed, but the elevation of horticulture to its legitimate position as having a broad scope and illimitable sympathies, and seek to place the Society in a position worthy of its name and nation.

But to the Show, for this time it is a Show, as may be expected when such an influential body of contributors offer spontaneously the aid of their rich collections. Of those who so promptly notified their intention to exhibit were Messrs. J. Veitch & Sons, Mr. B. S. Williams, Mr. Bull, Mr. Turner, Messrs. Paul & Son, Messrs. J. & C. Lee, Messrs. Osborn & Sons, Mr. Standish, Mr. Wills, Mr. Outbush, Mr. Laing, Mr. W. Paul, Mr. Wimsett, Mr. Morse, Mr. Barr, and a number of other florists and private gentlemen.

An offering such as this commanded success—a success unequivocal and complete. The last summer show of the season was not only the greatest, but greater than all the previous shows combined. Hitherto we had half-filled corridors, but on this occasion the spacious marquees were not only brought into requisition, but they were crowded to repletion. For this grand Exhibition the nurserymen have covered themselves with honour, and have proved unmistakably what English horticulturists can do when the craft they represent has due official recognition and encouragement. We were met at the outset by the remark of an experienced exhibitor, "Where are you going to begin?" Well might he have asked the question, for the aspect of the great plant marquee presented a bewildering array of beauty. But as we happened to be standing near the collection of Messrs. Veitch & Sons we will begin there in our glance at the commemorative section of this great Show.

It was an extensive and magnificent bank, rich, varied, and admirably arranged. The Tree Ferns and Palms towered aloft from a base of ornamental-foliaged plants. The margin was fringed with flowering plants, surmounted with *Nepenthes* laden with huge pitchers. Striking amongst the flowering plants were *Begonias Vesuvius*, *Model*, &c.; *Liliums* in variety, *Orchids* rich and rare, *Hydrangea paniculatum grandiflorum*, and a grand selection of *Gloxinias*. The basket Ferns *Asplenium longissimum* contributed a nice feature to the group, and the *Sarracenia*s were curiously attractive. It was a collection worthy of the efforts of the firm by which it was exhibited, and more need not be said.

At the opposite end of the tent Mr. B. S. Williams's noble contribution was arranged. This was a bold and massive bank of plants, which for size, quality, and arrangement have probably never been surpassed and seldom equalled. Tree Ferns, Palms, Cycads, Crotons, *Dracenas*, &c., were conspicuous amongst the fine-foliaged plants, the flowering section consisting of *Liliums*, *Anthuriums*, *Dipladenias*, *Stephanotes*, *Allamandas*, &c. This noble collection of plants was a central point

of attraction, and well they might be, for their intrinsic excellence commanded attention.

Contiguous to these, and distinct in appearance, was the valuable group of Mr. O. Turner. They consisted mainly of splendid specimens of *Ivies*, relieved by *Liliums* and fringed with *Palms* and cut *Roses*. Everything in the collection was good, and the effect was very striking. The decorative force of these *Ivies* must be admitted when seen in the condition in which these were shown. Facing these were the collections of Messrs. J. & C. Lee, Mr. Wimsett and Mr. Aldous. Messrs. Lee's group was extensive, and in remarkably good condition, and consisted of *Aloes*, *Ferns*, *Palms*, *Heaths*, *Liliums*, &c., Mr. Wimsett's being of the same character; Mr. Aldous's bank comprising smaller decorative plants, bright and fresh, as his plants invariably are.

Flanking the centre of the tent and arranged on terraced mounds were the imposing groups of Mr. Bull and Mr. Wills. Mr. Bull's was so good that to particularise the meritorious plants were to name nearly all; yet we note the massive *Palm Pritchardia grandis*, the most distinct of all *Dracenas*—*Goldiana*, the richness of colouring of *Croton majesticum*, the ram's-horn-like form of *C. volutum*, and the fine character and finish of *C. spirale*. The group also embraced a grand *Phyllotanium Lindenii*, *Cycads*, *Palms*, *Liliums*, *Orchids*, &c. It was a great and valuable collection. Mr. Wills's plants were not quite so large, but were equally healthy and attractive, and were bright by a choice fringe of flowering plants. Noticeable were the *Orchids*, *Lilium longiflorum*, *Begonias* in variety, *Gloxinias*, *Nerium splendens variegatum*, *Yuccas*, *Pandanus*s, *Palms*, *Ferns*, &c. Altogether this was a valuable contribution, and Mr. Wills is to be complimented on his products.

The central bed was occupied by Lord Londesborough on the one side with *Orchids*, and on the other by J. Peacock, Esq., with *Succulents*. The collection of one was exceedingly brilliant, and the other extraordinarily curious. The *Orchids* were represented by *Saccolabium Blumei* with eight racemes, *Dendrochilum filiforme*, *Epidendrum vitellinum major* and *memorale majus*; *Vandas Batemanii* and *Bensonii*, *Oncidium lanceanum*, &c., and a beautiful *Diss* from South Africa, similar to one exhibited in the Council-room by Mr. Bull. These *Orchids* were not large, but very beautiful. A specimen *Orchid* from Mr. Bates, gardener to W. H. Punchard, Esq.; Twickenham, deserves honourable mention; it is 4 feet through, with over twenty spikes and a hundred blooms. Of the curiosities of Mr. Peacock's it is impossible to select the most striking, but we notice *Echinopsis Wilkinsii* in flower, *E. scopa candida*, *Mammillarias* in variety, *Agaves*, *Yuccas*, *Pandanus*s, &c.—a very valuable and interesting group.

We now come to the outer circle of the marquee, and note well-bloomed *Ericas* from Messrs. J. & C. Lee; splendidly coloured tricolor *Pelargoniums*, and very fine *Liliums* from Messrs. E. G. Henderson & Sons; admirably grown *Caladiums* from Mr. Clark, gardener to W. Shuter, Esq., Hampstead; immense *Dicksonias* from Mr. Wills; a glowing collection of *Zonal Pelargoniums* from Mr. W. Paul in nearly every imaginable colour; clean, bright, and effective decorative plants from Messrs. James Carter & Co.; a rich and valuable collection of ornamental plants from Messrs. Rolliason & Sons, including an immense *Todes* and brilliant pans of the lowly *Nertera depressa* spangled with berries, *Nepenthes*, and fine baskets of *Reedia glaucescens* and *Phyllanthus mimosifolius*.

We now take breath and note effective and glowing *Clematis*, with *Ivies*, *Palms*, &c., from Messrs. W. Outbush & Son, *Hydrangeas* from Mr. Aldous, and beautiful *Succulents* from Mr. Dean and E. G. Henderson & Sons. For these plants good prizes were offered; the awards are in our advertising columns. *Ferns* and *Fuchsias* were exhibited by Mr. B. Parker, and a rich and effective group of fine-foliaged plants by Messrs. Osborn & Sons. Mr. Wheeler, gardener to Sir F. Goldsmid, Bart., set up a highly creditable collection of flowering plants; and well-bloomed and healthy *Heaths* came from Mr. Morse, Epsom. Messrs. Ivery & Sons exhibited a very complete collection of hardy *Ferns*; and Messrs. J. & C. Lee choice *Cypripis*, remarkable *Quercuses*, and *Roses*; and Messrs. J. Jackson and Sons brought twelve exceedingly fine and fresh *Heaths*. We complete our notice of these groups by noticing a splendid collection of specimen fine-foliaged plants from Mr. Harrow, gardener to H. Bessemer, Esq., Camberwell, the *Crotons* being in admirable colour, and the whole healthy; and a collection of well-bloomed *Orchids* from Mr. Stevens, gardener to the Duke of Sutherland.

**PELARGONIUMS.**—These plants were arranged down the centre of a tent 200 feet in length, and, as may be expected, they made a brilliant display. Still on examination we could not fail to be struck with the inferiority of a great number of the plants. They lacked the refreshing freedom which we should like to see, or at any rate the art of staking and tying should be more hidden.

In the nurserymen's class for eighteen *Zonals*, distinct, in 6-inch pots (open), Mr. Laing had the first place, Mr. Rose

second, and Mr. Meadmore third. None of these plants were of superior merit. For six Zonals, florists' varieties, in 8-inch pots (amateurs), Mr. Catlin had healthy and good plants, and easily won the first place, the second-prize collection being too flat, formal, and overdone in training. Six florists' varieties sent out in 1873, or not in commerce (open), Mr. Brise was first with Mr. Pearson's Lady Byron, John Fellows, Rev. J. Atkinson, John Gibbons, Ethel, and Sir H. S. Stanhope; Mr. Laing being second with Laing's Mrs. Sandring, Rev. T. Downie, W. K. McNab, Pearson's Rose of Allendale and Charles Burrows, and Dr. Denny's Richard Cœur de Lion. These contained some very fine blooms. Double varieties were not largely exhibited, and the plants generally do not call for comment. The awards are given in another column. Mr. Laxton, however, exhibited cut blooms of some fine seedlings.

In the class for eighteen Golden Tricolor varieties in 8-inch pots (open), Mr. Pestridge was first with dazzling plants; Mr. Meadmore being second with better foliage, but not so bright in colour. The best varieties were Peter Grieve, Prince of Wales, Florence, Princess of Wales, Miss Goring, Achievement, Wm. Sanday, and Mrs. Headly. In the amateurs' class Mr. Lambert had the first place with nice specimens, Mr. Hinnell being second with small but well-coloured plants. For six Silver Tricolors (open), Mr. Pestridge was again first with good plants of Mrs. J. Marshall, Lass o' Gowrie, Miss Burdett Coutts, Mrs. Col. Wilkinson, Miss Pond, and Charming Bride; Mr. Meadmore and Mr. Hinnell having second and third place respectively with nearly the same varieties. For six Gold Bicolors (open), Mr. Laing secured the first place with very effective plants, Mr. Pestridge being placed second, and Mr. Meadmore third. The best were The Czar, Emperor of Brazil, Mrs. H. Weir, W. E. Grumbleton, Earl of Rosslyn, and Mrs. Quilter. Cut blooms were very effective and good, and noticeable were some single pipe from Dr. Denny of great quality and substance.

#### PRIZES OFFERED BY THE PELARGONIUM SOCIETY.

These were very liberal, and cannot fail to give an impetus to the cultivation of this exceedingly useful family of plants. For twelve florist's varieties first honours went to Mr. Catlin for good plants in perfect bloom from 2 to 4 feet in diameter, Mr. Roser being second with loose plants. In some of the plants too many sticks were used, which spoiled their effect. For twelve plants of the "decorative" class (open), Mr. Catlin again secured the first place with dwarf, sturdy, massively-bloomed plants from 2 to 3 feet in diameter; Mr. Roser, gardener to M. T. Shaw, Esq., Wimbledon, being second with good yet looser plants. For a collection of thirty varieties, irrespective of class, in pots not exceeding 6 inches in diameter (open), there was good competition, the first award going to Mr. Catlin for vigorous plants with massive blooms; second to Mr. Brise for nice plants, but with a superabundance of white sticks. In the class for six Fuchsias (amateurs), some excellent plants competed. Mr. Harrington's plants were slender and elegant pyramids, Mr. Lambert's and Mr. Weston's being more bulky and massive.

CUT BLOOMS.—Carnations and Picotees were a grand show, Mr. Turner and Mr. Hooper having the principal places amongst the nurserymen, while in the amateurs' classes Mr. Douglas was pre-eminent, followed by Mr. Burnaby Atkins and other exhibitors whose names will be found in the prize list. Mr. Turner also exhibited special collections. The boxes of these flowers were so fine as almost to take one's breath away, and crowds clustered round them to criticise and to admire. Mr. Turner also staged twenty-four trusses of Verbenas of great merit. In hardy cut flowers Mr. Parker had splendid collections of eighteen and twelve varieties which showed to great advantage in contrast with the overpowering effect of the Pelargoniums. Messrs. Paul & Son, Cheshunt, staged an admirable collection of table plants and cut Roses of superior quality. Roses were also admirably exhibited by Messrs. Cranston & Mayes, and Mr. Prince, and contributed an important and attractive feature to the Show. Glasses of cut flowers for table decoration were contributed by Mrs. Hudson, Dulwich, and their arrangement evinced considerable taste.

#### FRUIT.

For the liberal prizes offered by Messrs. James Veitch & Sons was a grand and gratifying response. The first prize for ten dishes was worthily won by Mr. Coleman with grand Black Hamburgh and excellent Bowood Muscat Grapes, a good Pine and Melon, splendid Royal George Peaches and Oxonian Strawberries, Golden Gage and Early Prolific Plums, Figs, and Nectarines; Mr. Miles being second with a capital Pine and Melon, very good Grapes, splendid Cherries, Peaches, and Figs, and good Plums and Nectarines. Mr. Sage was placed third for a very nice collection, in which were noticeable a good Colston Basset Seedling Melon, and a fine but unripe bunch of Bananas. For six dishes Mr. Bannerman had the first place with Black Hamburgh and Muscat Grapes, Trentham Hybrid Melon, and Peaches and Nectarines, all alike of superior quality and finish; second honours going to Mr. Jones, gardener to the Marquis of Londonderry, in which the Grapes were remarkably fine and the other dishes very good. Mr. Cornhill, gardener to J. S.

Virtue, Esq., was third with a nice collection. Two others competed.

For the best three Pine Apples nine competed. The first-prize fruits were really fine from Mr. H. Scammell, gardener to O. Reilly, Esq., The Priory, Neville Park, Tunbridge Wells; he had Charlotte Rothschild and two Queens, all highly coloured and weighing 18 lbs. Mr. H. Chamberlain, gardener to H. Thompson, Esq., The Warren, Bushey Heath, had the second award with fruit of even size and in capital condition. Mr. Miles, gardener to Lord Carrington, Wycombe Abbey, being third with fruits weighing 15 lbs. 2 ozs.

Grapes. In the class for three bunches of any kind except Muscat of Alexandria and Black Hamburgh there were seven exhibitors, the first prize going to Mr. J. London, gardener to T. Barnes, Esq., The Quinta, Salop, for a bunch each of Madresfield Court, Golden Champion, and Sealiffe Black; Mr. W. Cox, gardener to Earl Beauchamp, Madresfield Court, being second for three bunches of Buckland Sweetwater; and Mr. Deaville, Wyaston Lays, Monmouth, third for the same variety. The quality of the fruit in these collections was of high average merit. For three bunches of Black Hamburgh there were fourteen competitors. The first-prize lot, which were exceedingly fine and well finished in colour and even in berry, fell to Mr. Coleman of Eastnor Castle; second honours for nearly equal produce going to Mr. Coomber, The Gardens, Hendre Park, near Monmouth; Mr. W. Jones, gardener to the Marquis of Londonderry, being placed third with fine large bunches. In nearly all cases these Grapes were remarkable for large bunches and berries, and were well finished. For three bunches of Muscat of Alexandria, the first prize was gained by Mr. Bannerman, gardener to Lord Bagot, Blithfield, Rugeley, with first-rate coloured berries and large bunches. Mr. J. London, The Quinta, Salop, being second with bunches of excellent colour, but rather looser. Mr. J. Woodbridge, gardener to the Duke of Northumberland, having the third place with fine bunches but not fully ripe. The Grapes generally were of great excellence, and were highly creditable to the different growers.

Peaches were a grand show. For the best six fruits there were about thirty competitors, first honours going to Mr. Richards, gardener to Baron L. de Rothschild, for a splendid dish of Bellegarde; second to Mr. Fennell, gardener to E. Casalet, Esq., for a beautiful dish of Noblesse; and third to Mr. Edmonds, gardener to the Duke of St. Albans, for unnamed fruit of high quality.

For the best six Nectarines twenty dishes were staged, first honours going to Mr. Edmonds for a handsome dish of unnamed fruit; second to Mr. Jack, gardener to the Duke of Cleveland, for a highly-coloured dish of Elruge; and third to Mr. Brise, gardener to J. H. Lermite, Esq., Finchley, for Violette Hâtive of superior quality.

Gooseberries in great variety were exhibited by Mr. Walker, Thame; and Apples by Mr. Earley, Valentines. Six Little Heath Melons, weighing 39 lbs. and beautifully netted, were exhibited by Mr. Bennett, Rabley, Herts. Mr. Jones of the Royal Gardens staged remarkably fine Peaches, Nectarines, and Plums; and Mr. Morris, Potter's Bar, Peaches and Nectarines.

Cucumbers were a poor show, the awards going first to Mr. Bennett, and second to C. B. Bingley, Esq., both with good fruit of Duke of Edinburgh.

Thus is concluded our necessarily hurried report of this great Show. As an exhibition it was one of the best of recent years, and all connected are to be congratulated on the success of their efforts. Unfortunately the rain poured down in torrents, and it was wisely proposed by the Council, a proposal which met a generous acquiescence on the part of the exhibitors, to continue the Show another day, that the public may have an opportunity to enjoy a treat which is eminently worthy of their patronage, and which cannot fail to afford them both pleasure and instruction.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. Mr. Barron's report on the Early Snowball Cauliflower was read; he stated that he had inspected the plants growing at Bedford, and they did not appear to have been subjected to any exceptional treatment. The Committee decided that it be submitted to a trial with a general collection of Cauliflowers at Chiswick next year. Mr. Perkins, Thornham Hall, Eye, sent a dish of Dan's Mistake Gooseberry. He also sent a fine fruit of Barington Peach, which was sent under the name of Bellegarde. A dish of Red Tomatoes shown by Mr. Perkins were pronounced by some members to be "the best they ever saw," and were awarded a cultural commendation. Mr. Gilbert of the Gardens, Burghley, Stamford, showed a dish of Jackson's Seedling Tomato, which is very similar to Hathaway's Excelior and Carter's Green Gage; they were finely grown and received a cultural commendation. He also sent a seedling scarlet-flesh Melon which was not in condition. Mr. Freeman, the Gardens, Beechwood, sent a brace of Duke of Edinburgh Cucumbers, and Mr. S. Owen, gardener to G. S. Schwabe, Esq., Broughton, Liverpool, sent a seedling Cucumber similar in character to Telegraph; it was a very fine fruit, and received the commendation

of the Committee. Mr. J. Maher, Stoke Court, Slough, sent a brace of Cucumbers called Sultan, which though fine fruit, were not distinct or superior to others in cultivation. Mr. E. Bennett, Babley Nurseries, Shenley, sent a Cucumber called Rabley Hero. He also exhibited a fasciated branch of Duke of Edinburgh Cucumber; the fasciation, which was  $\frac{3}{4}$  to 4 inches wide, was like a broad band with the leaves and Cucumbers stitched on it.

Mr. Charles Turner, Slough, sent a quantity of his new Pea Dr. Maclean, a fine large full-podded Pea containing eleven Peas. It was much admired, but before making any award on its merits it was decided to have it grown at Chiswick. Mr. Woodbridge, the Gardens, Syon House, Isleworth, sent a branch of Bigarreau Napoleon Cherry, studded with fine large highly-coloured fruit. A vote of thanks was awarded to Mr. Woodbridge. G. F. Wilson, Esq., Heatherbank, Weybridge, sent a dish of Beurré Giffard Pear from a tree grown in a pot, the fruit set in an orchard house and ripened out of doors. They were quite ripe and of excellent flavour. Mr. Tillery of Welbeck sent a dish of very fine Galande Peaches and Violette Hâtive Nectarines, which received a cultural commendation.

Mr. Jones of the Royal Gardens, Frogmore, sent a seedling Apricot called Frogmore Early, a small Apricot the size of Breda, quite ripe, and was grown against a wall in the open air. Mr. Jones stated that he had been gathering the fruit since the 13th of July (nine days ago). In consideration of its high merit and earliness in a season which is proverbially a late one, the Committee awarded it a first-class certificate. Mr. Stevens, gardener to G. Simpson, Esq., Wray Park, Reigate, sent a seedling Melon, Stevens's Seedling Green-flesh, but it was not in condition. Mr. Wildsmith, gardener to Viscount Eversley, Heckfield, sent a seedling Melon, but it had not much flavour, but it was so thin in the skin and so promising the Committee expressed a wish to see it again. Mr. Raynham, Stradeshall Place, Newmarket, sent a seedling scarlet-flesh Melon of very promising character, which the Committee asked to see again. It is to be remarked in justice to the reputation of these new Melons, that the late heavy and continuous rains and sunless skies have operated very much against their successful cultivation.

**FLORAL COMMITTEE.**—B. S. Williams, Esq., in the chair. Mr. Robert Fleming, gardener to R. Houghton, Esq., Sandhays, Liverpool, sent a very fine form of *Adiantum cucullatum* var. *Flemingii*. It is far superior to *A. c. latum*. The fronds are finely divided, and arch over more gracefully. This had a first-class certificate. *Polystichum angulare* var. *grandidentum* purpureum from Messrs. Ivery & Sons, Dorking, also received a first-class certificate. The fronds are narrow and sword-shaped. Other fine forms of the species were sent by the same exhibitors. They had also a very fine form of the Lady Fern, *Athyrium Filix-femina cristata* Iveryana, and another *A. F.-f. Veronica crispa*, and *Scolopendrium vulgare* Droveri.

A group of single and double Zonal Pelargoniums were sent by Mr. W. Paul of Waltham Cross. They were mostly continental seedlings, and comprised some very distinct flowers. Talabot, a purplish crimson double, is very distinct, and had a second-class certificate. Ernest Faivre, white, salmon centre, is very dwarf and distinct; and Madame Thibaut, bright rose, very distinct, double, of good habit. Mr. G. Smith, Tollington Nursery, Hornsey Road, Islington, sent a very fine Zonal, white with salmon centre, named Evening Star; and Challenger, a variety of the Nosegay type with an immense truss of crimson flowers; also a basket of a remarkable double Zonal Pelargonium, a sport from Vesuvius. The flowers are semi-double, and the petals have the quality of hanging to the trusses more firmly than in any other sort. It deservedly received a first-class certificate. It will doubtless be a fine bedding plant. Messrs. E. G. Henderson & Son of St. John's Wood sent a very fine group of new plants, comprising *Sonchilias*, of which *S. Hendersonii argentea* and *S. Hendersonii marmorata* are very fine. *Begonia* Prince of Wales and Princess of Wales of the linear-leaved group are quite distinct in character. *Pellaea Bridgesii*, a neat Fern with glaucous fronds, had a second-class certificate. They also sent a collection of *Begonia*s of the *B. Veitchii* type. Mr. C. Green, Botanical Nursery, Holmesdale Road, Reigate, sent a new Aloe mottled like the old partridge-breasted species, with elongated spiny-curved leaves. It received a first-class certificate.

From the gardens of Sir G. Macleay, Pandell Court, Blotchingly, were sent out flowers of *Begonia Vesuvius* from the open ground. Its large bright vermilion flowers were splendid. A new Rose with the foliage splashed conspicuously with yellow was sent by Mr. J. Perkins of Thornham Hall, Eye, Suffolk. The flowers are not of very good quality.

A collection of cut leaves with pitchers of six different species of *Nepenthes* sent by Mr. D. Thomson of Drumlanrig Castle Gardens, Dumfries were much admired for their extreme beauty. *N. distillatoria* was represented by a growth with seven very large pitchers. *N. Rafflesiana* was also very grand.

A basket of a good type of Zonal and seedling Pelargoniums was sent by Mr. Young, gardener to H. Webb, Esq., of Redhill.

Mr. W. Bull of King's Road, Chelsea, also received first-class certificates for *Dracena triumphans*, a species with bronzy metallic linear recurved foliage; *Kentia Moorei*, a splendid Palm with noble foliage like *K. Fosteriana*; *Diss. Borelii*, a very fine species, which might be designated a major form of *D. grandiflora*, but much superior to any of the forms of that fine species; *Lomaria debrodyensis* and *Martinezia nobilis*, a very fine decorative Palm. Mr. Bull also exhibited a large number of new Palms, Ferns, and other plants.

Messrs. J. & C. Lee sent *Juniperus virginiana*, "*Triomphe d'Angers*," which received a first-class certificate; *Taxodium sempervirens alba apica*, and other coniferous trees and shrubs. A first-class award was voted to the Juniper. Rev. J. B. Norman, Whitechurch Rectory, Edgware, had botanical certificates for *Masdevallia* species, supposed to be elephants, of a bright greenish yellow externally, the lip a purplish brown—a curious and interesting species; and *M. Normanii*, the back of the flower a reddish purple, and internally a greenish ivory white with yellow tails—a very pretty species. Other plants may be omitted owing to their removal from the Council-room before our notes were completed.

## THE ROYAL NURSERIES, SLOUGH.

Our main object in visiting these nurseries was to see the Peas now growing in the grounds, and especially to note the condition of a new variety bearing an honourable name—Dr. Maclean. It is very easy and very common, also natural, on seeing an exhibition of plants, fruits, or vegetables, to fancy that we have examples as good or better at home. Such opinions are frequently and honestly formed, but in nine cases out of ten if that which in the solitude of home looks so meritorious is placed in position with the best products of others, our idol is robbed of a portion of its glory, and it is only then that we really and accurately obtain a just measure of its merit. No one is more alive to this fact than Mr. Turner, and no one could less afford to attach his name to a commodity of doubtful merit or fictitious fame; hence his new Pea must undergo the test of a full and fair trial with the first and best varieties of the day, and must stand or fall on its merits in comparison with those of its peers.

This parliament of Peas now in session at Slough consists of twenty-five representatives of the great Pea constituency. All the famous Peas are here, from Alpha to Omega. There are fat and full G. F. Wilsons, dwarf and sturdy Uniques, gigantic Superlatives, and all sorts of big marrows. Best of All is in ruddy garb, and James's Prolific is heavily laden. There is a row each of Quality and Quantity, the tempting Connoisseur, the new and good Supplanter, and of course the Premier. Such are a sample of the varieties which have proved their worth and calibre; and fine as these rows are, and worthily as they have won their fame, yet we say it—because we cannot by seeking find a shade of doubt on the point—that if the new member had been named Alpha or Omega, Best of All, or Premier, or any other title which fit the others so well, that it were worthy of that title, for it is the first in appearance—a veritable "Alpha," the last in age—an "Omega," and a splendid finish; it is the "Best of All" the gathering, and a veritable "Premier" amongst its peers.

We are aware that is saying a great deal, but we have not a word of qualification to append. We say it because it would not be justice to say anything less, and because we have no fear of our verdict being challenged by other competent judges. The rows of Dr. Maclean are nothing short of a grand sight. Not in one point alone does this Pea excel, but in every quality its merits are apparent. In productiveness it is unequalled, in size of pod unsurpassed by any save Superlative, in fulness it is replete, in colour all that can be wished, and in sturdiness and vigour it satisfies an exacting criticism. We have only to add that it is 3 feet in height, and is—for on this point we have tested it—of high table quality.

Mr. Turner has sent from his nurseries many things of which he may be proud, but nothing in either plant, fruit, or vegetable for which he is responsible will better uphold his reputation than Dr. Maclean Pea. We almost venture to hope that with his success he will be generous, and enable all Pea lovers to afford to possess a supply of this fine variety; and if it flourishes equal to its present doings at Slough, they will have an acquisition in the shape of Peas which will enrich their vegetable collections, rich as they may have been before. We take leave of this Pea by saying it is the finest variety we have ever seen growing, and in quality we cannot name a better sort.

But while at this nursery we must give a passing glance at some other of its occupants. Pre-eminent just now are the *Carnations* and *Picotees*, of which perhaps Mr. Turner holds the finest collection of the day. Through all the varying phases of fashion these fine garden flowers have been cherished, preserved, and improved. And glad we are to note that they are rising in public estimation, and that the demand for them is every year increasing. No flowers of the garden are more intrinsically beautiful than are these, and with their beauty is blended sweetness. They are hardy, and of easy culture. When in bloom they are exceedingly handsome, and even when out of bloom the plants neither look seedy nor weedy. No wonder that their cultivation should spread, and it is surprising that they should be affected by any decorative fashion of the hour. For the benefit of those who cannot choose for themselves we name a few in each section—the cream of an exceedingly valuable collection—as possessing undoubted merit, and which may be grown with confidence.

**CARNATIONS.**—*Scarlet Bizarres*: Campanini, Dreadnought, Fanny Gardener, Guardsman, Mars, Mercury, Eccentric Jack, Marshal Ney, Rifleman, Purity, Albion's Pride, and John of Gaunt. *Purple Flakes*: Dr. Foster, Earl of Stamford, Ajax, Mayor of Nottingham, Florence, and Ascendant. *Scarlet Flakes*: Mars, Superb, Annihilator, Mr. Battersby, Sportsman, and Splendour. *Rose Flakes*: John Keet, Christigala, James Merryweather, Sybil, Phœbus, and Mrs. F. Burnaby. *Clones*: Hindoo, Prince Arthur, Bride, Albert, Cremorne, Maiden's Blush, King of Yellows, and Géant des Batailles.

**PICOTEES.**—*Red-edged*: Mrs. Norman, Princess of Wales, Mrs. Horaby, Leonora, Miss Small, J. B. Bryant, Peeress, and Mrs. Keynes. *Purple-edged*: Cynthia, Venus, Chanticleer, Alliance, Mary, Mrs. Little, and Admiration. *Rose and Scarlet-edged*: Mrs. Fordham, Edith Dombrain, Mrs. Allcroft, Miss Sewell, Juliana, Miss Wood, Ethel, and Regina.

This is a short but select list of the flowers as seen in perfection, and if justice is done them in culture they cannot disappoint.

**PERLONIA** of the Show and Fancy section are another speciality of this nursery. For a time the Zonal section absorbed primary attention, and there was a subsidence in the demand for the class we are noticing. The two sections are so thoroughly distinct that it is almost absurd to think of one being in any way a rival to the other. Neither is it so now, for the demand for both is rapidly increasing. Than the Show and Fancy *Perlonias* no more beautiful greenhouse plants are to be found in cultivation. It is superfluous to say that no one grows them better than does Mr. Turner; that is admitted, and we can better utilise space by noting a few of the very best for the information of others who are contemplating the culture of these plants. The blooming period is now over, and the plants are being cut down and placed in a light house to break. The cuttings are being struck in sandy soil also in the same house. The varieties have been seen at the principal exhibitions, and we note a few of the best of them.

The new sorts are an exceedingly fine group, Crown Prince being perhaps the best, followed by Constance, Archduchess, Isabella, Queen Victoria, Presbyter, Sultan, Dauntless, Alice, Duchess of Cambridge, and Sybil. Those are all varieties of high merit. From the general collection we select Ruth, Favourite, Duke of Cambridge, Claribel, Highland Lassie, Iron Duke, Blue Boy, Coronet, Conquest, Great Mogul, Lord Byron, Mabel, Prince Leopold, Protector, Scottish Chieftain, Statesman, Prince Arthur, Purple Gem, Victory, and Pompey.

The newest Fancies—Atlantic, Henry Bailey, Jewess, Lady Mayores, Mrs. Hart, and The Shah—are all of very superior merit; and amongst the best of the older varieties may be noted Ellen Beek, Agrippa, Fanny Gair, Vivandière, Princess Teck, Marmion, Mrs. Alfred Wigan, Victor Hugo, and Excelsior. Triomphe de St. Maude and Queen Victoria are the most striking of the French section, the variety last named being remarkably bright. The above list is a very choice and reliable one.

**ROSES.**—These are only noticed to say that the majestic plants which have achieved so many triumphs have just been spotted, and are kept under glass to make their growth. So many growers of pot Roses do not repot until the autumn that we note the practice which is adopted in the culture of some of the finest plants which have ever been perfected. We also note as bearing on the soundness of Mr. Cann's views that the whole of the Roses which Mr. Turner has this year exhibited are the produce of cut-back plants. Up to this date, July the 17th, Mr. Turner has not commenced to cut from his

maidens; fine blooms are ready, but are being injured by the incessant rains.

We cannot detail the condition of the extensive and fine collection of pot Vines and the collections of plants generally; it must suffice to say that they are in the first order of health, and that the entire establishment is in a high state of keeping.

## NOVELTIES IN THE ROYAL GARDENS, KEW.

**EURYANGIUM SUMBUL** is flowering in the Herbaceous ground for the first time in this country, and a more important plant from a scientific point of view has not flowered since the *Rheum officinale* of last year. It yields the drug known as "*Radix Sumbul*," which about the year 1835 was first introduced to Russia as a substitute for Musk, and then recommended as a medicine against cholera. It was first known in England about twenty-five years ago, was included in the British pharmacopœia in 1867, and is now prescribed in tincture form as a stimulating tonic. The species yielding this drug was not known till 1869, when a plant flowered at Moscow, received from the mountains of Maghian eastward of Samarcand, which proving new was named and described by Kauffmann. Its root only appears in commerce, cut into transverse slices an inch thick. The musky smell of the resin is strong and agreeable, but is not fully developed until after contact with water. The root of this specimen is fusiform in shape,  $3\frac{1}{2}$  inches in diameter near the top, with a flowering stem nearly  $8\frac{1}{2}$  feet high. The leaves are now dead; they were much-divided and similar to some species of *Ferula*, to which genus this is closely allied. Its cultivation is not difficult, though in pots it will apparently not succeed, as the leaves die off on the slightest check. In the open ground, however, where the roots are free it does well. Sandy loam should be prepared, intermixed with stones, and the plant should be placed on a small mound so as to be a little above the ground level. It is evidently accustomed to a dry season of rest, it is therefore necessary to cover with a handglass during winter. A mulching of litter is beneficial in summer. The roots do not branch, and when at rest may be sent to a distance in the same way as a bulb.

In the Orchid-house porch, near the Carnivorous plants, we observe the very rare and pretty *Sarmienta repens*, which though small is covered with flowers. It is much like a diminutive *Eschynanthus*, and has the same habit. The flowers, it has been aptly observed, are like *Mitraria coccinea*; they are, however, a little reduced in size. We know of no one cultivating this plant but Mr. Wheeler of Warminster, who is very successful in its culture. It is a native of Chili and Peru, and does best on a shelf near the glass. In the choicest collection of greenhouse plants this should be included. It would be especially useful for baskets, and perhaps rockwork. We believe that a greater number of Chilean plants are hardy, or nearly so, than is supposed, and therefore we should recommend a trial of this plant out of doors in a sheltered position. It has been included among stove plants, but there it is certainly not in its proper place.

On the Rockwork some *Orchidaceæ* appear to do well. *Orchis latifolia* var. *speciosa*, a large form from Morocco, is very handsome. *Orchis latifolia* var. *sesquipedalis* and *O. foliosa* are also good. The Man Orchis (*Aceras anthropophora*), a rare British plant, has been in flower for the last two months. Here we are glad to see healthy plants of the blue *Meconopsis Walli*hi, of which we gave a figure last year, and another species *M. simplicifolia*.

Noteworthy as a rarity, though not now in flower, is *Arnebia echioides*, which we believe is the only plant now in the country. It is of neat habit, and has scorpioid spikes of yellow flowers with five purple spots at the throat. It belongs to the *Boraginaceæ*, and is native of the Caucasian Alps and Armenia.

Among other interesting plants in flower may be mentioned *Svertia perennis* with peculiar purplish blue flowers; *Sedum obtusatum* with foliage much like *Echeveria pumila*, but with yellow flowers—it is quite a distinct species and is yet rare; *Saxifraga mutata*; and a hybrid of which it is one of the parents, the other parent being *S. aizoides*.

## THE NEW DISEASE OF POTATOES.

Now that the subject of the new disease (not new with me, having noticed it here for four years) is being discussed, every hint and observation leading to the discovery of the root of the evil is of value, for as physicians say, "knowing the disease is

half the cure," so with our horticultural diseases. Now, my own observations respecting these Yankee Potatoes are, that the nearer we can bring their cultivation to that of their native country the less liable they are to disease, in proof of which I have here eight rows of American Early Rose and one of Snowflake planted in a warm and sheltered kitchen garden, soil deeply trenched and heavily manured; they have made very robust growth and formed good tubers, with no signs of disease. In a field I have one acre of Early Rose; this land also received a fair coat of manure last autumn, but the soil is very shallow, and here about one-twelfth is gone off. In a field not far from mine a still more striking example may be found. About half an acre is planted with Early Rose; one part of this half acre was manured, the other half received none. The part manured have grown well, and are looking healthy and strong, with very little signs of disease; the part not manured came up weak, grew slow, and I do not think one root will escape; so from these facts I consider they want to be grown quick, for which they require a good soil and warm situation.

In regard to Sutton's Flourball Potatoes, my experience goes to prove that they are not subject to the disease. I have grown them in quantity four years, and this year I have about one acre of them, but I have failed to discover any trace of disease upon them, and they have also proved themselves with me to be more proof against the old disease than any other variety I cultivate, and I find it also the best-keeping variety, having it now in fit condition for the table.—JOHN GREEN, *Nerwich*.

My crop of Potatoes is ruined and is quite worthless, so I for one have good reason to believe that the disease, be it new or old, is a serious visitation. As soon as the tubers commenced to form the stems commenced to wither, eventually blackening to complete decay. They are about the size of rifle balls, and have not moved for the past month, and will evidently not become any larger. In some cases the old sets are sound, and in others they are rotten. The failure is complete, and the total value of the crop will not equal the value of the seed Potatoes which were planted. They are American varieties. I send you a sample, and perhaps you will be able to say whether it is the "new" disease or not. It is idle to ask for a remedy, for the evil is done, and is manifestly irremediable.—S. H., *Essex*.

[The disease is identical with that which is so extensive at Chiswick.—EDS.]

### INFORMATION ABOUT PEARS.

I ENTIRELY agree with Mr. Taylor as to the importance of this matter, for there is no hardy fruit equal to the Pear in value or utility—value for the varied and delicious flavour of so many kinds, and utility for the length of time which a good selection will afford a succession of choice fruit for the table. It is precisely the want of local information that proves such a stumbling-block to one in planting Pear trees in a new place, especially when space is an object or when it is a commercial speculation.

There is no fruit so difficult to "hit off" as the Pear, fruit of the same sort being very different in two gardens a slight distance apart, and even from a couple of trees in the same garden; and therefore for any information to be really useful it must embrace the most minute details of soil, situation, and culture. Tables similar to the example given by Mr. Taylor would prove of the greatest value, and I should be happy to assist in so useful an undertaking so far as a collection of young trees would enable me to do so; but the work should not stop at such a point, which is in reality only the beginning. All who can should deal with the subject more at length, and by enriching the pages of the Journal with fruit lore strive to render it the best guide in this as in all other branches of horticulture.

One of the best aids towards the accumulation of such facts is a fruit book, in which every tree is entered, with a suitable space left after each name for brief annual notes. The memory is treacherous, and if trusted to entirely many little points of considerable importance are apt to be forgotten. Of course when the trees number only a few dozen a book would hardly be required, but when the collection amounts to several hundreds it is really indispensable.

Mr. Taylor is doubtless fully aware that the weeding process of "eccentricities of taste" which he contemplates would prove a difficult affair. By what standard does he propose to

try them? Surely the decisions, or rather excisions, must be ruled by weight of numbers and not by mere individual opinion, than which nothing differs so widely. For example, I cannot agree with him in his estimate of Duchesse d'Angoulême and Beurré Clairgeau. The Duchesse is certainly sometimes insipid, but I would not condemn a really excellent kind for a failing which is only developed under circumstances preventing a better state of things. Beurré Clairgeau has proved so good with me from trees upon free stocks that I planted a dozen more of it last season, and I have it now trained to walls of east and west aspects, horizontally and as oblique cordons, as well as in the pyramidal form in an orchard. It is an undoubted fact that the fruit of this Pear is frequently deficient in richness, and is therefore comparatively worthless in many gardens, notably in cold heavy soils, but in light soil it answers better, and is often as excellent in flavour as it is ornamental in appearance. Both kinds would probably be classed as doubtful and uncertain, and I much fear that the sorts which must be so classed will always prove greatly in the majority. However this may be, there can be no doubt that an immense amount of good would result from such an inquiry, and a mass of reliable information be accumulated, which would not only prove of the greatest assistance to the regular practitioner, but would also impart confidence to the amateur upon a matter concerning which he has so long been beset with hesitation and doubt. In a word, it would tend to render Pear culture far more popular than it is at present, and we should find that space would gladly be afforded to many highly meritorious varieties hitherto comparatively unknown as well as the Jargonelles, Bon Chrétien, and half a dozen other kinds which have so long reigned pre-eminent in many small gardens.

Information is also much wanted about the effect of the different stocks, especially upon the fruit, in its quality, quantity, and how soon after planting it is freely produced, so as to ascertain which sorts may be depended upon for coming quickly into bearing while the trees are young—a matter of considerable importance, especially in a new garden, where it is desirable to secure some return as quickly as possible for the heavy outlay that is usually incurred in the planting.—EDWARD LUCKHURST.

### LATE PEAS.

I HAVE nothing to add except that my district is a dry one, the average rainfall being 20 inches.

In 1868 I gathered ripened Peas of Carter's First Crop, and sowed them the same day in trenches, and gathered green Peas from them in October, but they were not so good as were those from old seed sown on the same day. The old seed came up the first and the most regular. Neither of these were half so good as was Ne Plus Ultra, gathered throughout November of that year.

Ne Plus Ultra and Auvergne are the best dry-weather mildew-resisting Peas we have. Sown in trenches and deluged once a week, using salt in the water at the rate of half an ounce per gallon, I have not failed to have frequent dishes of Peas throughout November for the past seven years. It is not a question of Peas versus Scarlet Runner Beans. Supply a dish of Peas two or three times a week in the autumn, and the Beans will be the more relished for the change.

As Mr. Robson is interested, I will, on a future occasion, give my experience of growing other vegetables in trenches, beginning with Potatoes. I may add that if in this northern latitude our summers are dry, our autumns are generally wet, and perhaps the rains may set in earlier than they do in the south, and herein we may have an advantage.—A NORTHERN GARDENER.

### THE RESTING-SPORES OF THE POTATO DISEASE.

MR. A. F. BARROW of Chiswick, to whom I am indebted for many specimens of diseased Potatoes, in recently writing to me as to the present aspect of the murrain described the attack as the most virulent of all he had seen. In some plants at the present time the leafstalks suddenly lose their hold, the leaves tumble off, and the plant rapidly disappears. The disease put in its unwelcome appearance a month or six weeks earlier than usual, and the first diseased foliage which came under my notice for examination was received from one of the correspondents of the *Journal of Horticulture* at the beginning

of June. In those leaves I detected the mycelium and a few fertile threads of the obnoxious fungus which always accompanies, and probably causes (judging from its effects) the Potato disease. The reason why competent observers believe the fungus to cause the disease is simply this: If the spores are allowed to fall artificially upon the leaves, or even stem or tuber, they burst and grow, and wherever they burst (their contents being extremely potent and corrosive) they immediately bore a hole through the skin and enter the plant. Of course the spores eat their way into the plant in the same unceremonious manner when they fall naturally upon it; and if leaves are kept under observation it is invariably seen that wherever the damaging mycelium of the Potato fungus runs, there, and there only, the Potato plant is discoloured, burnt up, and corroded as if some poisonous acid had been introduced into its system.

Soon after I had thus early detected the true Potato fungus in the specimens sent from the office of this Journal, Mr. Berkeley, at the meeting of the Royal Horticultural Society held on June 16th last, directed the special attention of the gardening public to the early and extremely virulent nature of the disease. At the same time he said he had detected a fungus new to him in the tissues of the Potato leaves, which he referred to a dubious class of fungi always found growing within the tissues of plants, and named *Protomyces*. In my search for the latter body I met not only with the presumed *Protomyces*—really the mature resting-spore—but also the male and female organisms which gave it birth. How this arose was detailed in the paper read before the Royal Horticultural Society, and printed in last week's number of the *Journal of Horticulture*. I am disposed to entirely account for the excessive virulence of the disease this year from the fact of these resting-spores being prematurely formed in the substance of the young plants. They are embedded like cancers in the tuber, haulm, and foliage; and in whatever part they are seen, there the cells of which the Potato is built up are corroded and destroyed. On the application of moisture to the plant, as supplied naturally by the atmosphere or artificially by watering, this spawn within the plant starts into renewed life to further poison the tissues, produce fresh spores for the present season and resting-spores for the next.

With a little attention it is quite easy for any person of ordinary ability to understand the nature of the Potato fungus and how it affects and destroys the plant it lives upon. From the smallness of the parasite it is almost invisible, but its smallness is compensated for by the habit it has of so rapidly increasing, that one infected plant on a given spot will in a day or two cause the fungus to appear on every plant in the neighbourhood. Because it is small it must not be considered impotent or disbelieved in. The aphid is small, but none the less destructive; and it is quite as unreasonable to refer the Potato disease to wireworms and other insects, as for some dim-sighted person to deny the damaging effects of the aphid because he could not see the insects, and charge rats with the damage because he happened to see a rat—an animal he *could* see—wallowing about amongst dead plants.

A word may here be said about certain words and terms used in the description of various organs and structures of plants. It is really melancholy to find writers who ought to know better attempting to cast ridicule on the things they cannot understand. One writer strong in wireworms and rats may be found laughing at the pest which for good reasons is supposed to cause the murrain, simply because he cannot understand or see it, but the most short-sighted person can of course see a big insect or a four-footed animal. Insects are always attacking Cabbages, Turnips, and other kitchen-garden plants, but no one has ever yet seen a Cabbage or Turnip with the Potato disease, although it is common to see both and all similar plants with the wireworm.

A friend of mine, too, has recently acknowledged in print that "ordinary capacities are staggered on the very threshold" of the paper you printed last week by such words (amongst others) as "cellular tissue" and "mycelial threads." Now, surely, this is a libel on the gardening fraternity at large, for if there are any men of "ordinary capacity" who buy and read the horticultural papers and don't know that the spawn of a fungus is composed of "mycelial threads," and that a plant is entirely built up of "cells" packed together and called cellular tissue (and tubes called "vessels"), then I venture to say the time is fast approaching when such men will have to retire from the honoured ranks.

I have engraved the accompanying figure of the Potato

fungus in its new aspect, so that all readers of the *Journal of Horticulture* may, if they try, thoroughly understand its nature and effects. First of all it must be remembered that the Potato plant (like all other plants) is principally built up of cells, called "cellular tissue." The present figure is a greatly enlarged view of a small piece of Potato stem. Now, I have little doubt every reader of this paper well knows that a Potato stem is not like a solid piece of iron, or marble, or glass, but that it is principally built up of a number of cells filled with fluid, which when enlarged in size look like the cells of a honeycomb. These honeycomb-like cells are almost invisible to the unaided sight, but when they are greatly enlarged by a good microscope they are seen exactly as at A on the accompanying engraving. The Potato fungus is principally seen on the other side of the illustration, and everyone who looks on the figure will observe that if the cells are next to invisible without a glass, how much more so must be the threads and spores of the fungus, which are drawn to the same scale.

The Potato fungus is principally composed of threads, called "mycelial threads" or spawn, s s. These threads are poisonous to the Potato plant, and wherever they go they scorch and dry up the cells of which the Potato plant is composed. The threads branch in various directions, and the branches bear "simple spores," or seeds, at their tips, o c c. These spores when ripe fall from the threads, burst, enter the plant through the skin or breathing pores, and make fresh corrosive threads, which soon produce a new generation of spores. At the ends of some of the branches it is common to see spores of a different nature, d d. These are called "swarm spores" because they are many times bigger than the simple spores, and contain within themselves a swarm of spores. On the application of moisture the skin of this large spore bursts and sets free, instead of one, a "swarm" of nearly twenty spores. These fall again on the plant, burst, enter the skin, and send out corrosive threads into the tissues just like the last-mentioned; but they differ from the simple spores in a remarkable way, inasmuch as each individual of the swarm is furnished with two lash-like tails, x x. With these tails they whirl themselves about in moisture, spin round and round, and dart about in different directions with the greatest rapidity like animalcules (for this reason they are called zoospores, because they are partly animal-like). It will be seen from this that when in moist weather the wind cannot carry the infection by the simple spores, the moisture supplied to the Potato by dew or showers enables these animalcule-like zoospores to propel themselves in different directions from one plant to another.

The above contains the pith of all that was known about the damaging Potato fungus till this year, although it has from the first been suspected that the parasite had some means of living during the winter, or how could it appear with such regularity every summer? This winter life is now understood, and it may possibly prove one step towards the extirpation of the pest. The two sorts of spores above described are very fragile and short-lived. If they do not fall upon the Potato plant or some close ally they speedily perish, but if they do fall upon the Potato plant they speedily kill it, and they and their mycelial threads perish with the victim.

The Potato fungus lives through the winter in the ground, and resides during this period in a state of sleep or hybernation within a "resting-spore," as it is called, because this sort of spore when mature does not burst and enter the plant, but it surrounds itself with a hard coat (at the Potato plant's expense), and falling to the ground with the dead haulm, leaves, and tuber, quietly rests in the ground till the following summer.

This resting-spore is brought into being in a different manner from the simple spores and zoospores, and this is how it is done: Instead of spores, two different-sized bodies arise from the threads, one a globular semi-transparent organism, similar in nature to the ovule of a flower, r r; and another much smaller and similar in nature with an anther and its pollen, c c. In a somewhat similar manner to the anther coming in contact with the stigma of a flower, these two bodies come together, and the material contained in the smaller body is discharged through a minute tube into the matter contained in the larger one. This action causes the larger body to secrete a new coating as at x, and afterwards become a fertile resting-spore. As it grows it speedily disengages itself from the thread which has borne it, s s, and it falls to the ground with the dying plant, and rests in the earth like a seed.

Judging from the nature of other resting-spores, the resting-spore of the Potato disease at first germinates in the earth like Dodder, and if (again like Dodder) it cannot find a fit plant to grow upon it speedily perishes; but should a Potato plant be in the vicinity, the poisonous threads of the resting-spore reach it, find their fitting food in it, and doubtless as once enter the skin, as the threads from the more fragile simple spores and zoospores are able to do. When these threads

Fig. 2.—THE POTATO FUNGUS AND ITS RESTING-SPORES,  
Taken from the Stem of one of the Chiswick plants.

once get in or on the plant they speedily produce the simple spores just described, and these get blown amongst the Potatoes in every direction, and the regular recurrence of the disease is the result. The conclusion of the sad history is this, that when the plants are prostrate and on the point of death they become the prey to insects, as Mr. Berkeley thirty years ago pointed out. In the same way the noble lion is preyed upon by baser animals when weak and dying; but Potatoes are not

vanquished in fair fight with wireworms any more than the king of beasts is beaten by a jackal.

Any suggestions as to the cure of the disease may well be reserved for another time. It does not, however, follow that because a man knows the nature of a disease he can cure it. The complete knowledge of a disease often only assures the doctor of its perfectly insurable character, although it would be premature to say that nothing can be done to mitigate the Potato murrain.—WORTHINGTON G. SMITH.

### DRYNARIAS.

BEAUTIFUL and elegant stove Ferns are the Drynarias. They are by their distinct features worthy of cultivation wherever graceful plants of chaste form and quiet colour are cherished.

They are of a class which possess a sober airy beauty and are attractive in themselves, and they also, by contrast, bring out the charms of other plants to greater advantage. Plants whose principal beauty rests in the form or colour of their foliage rather than the mere brilliancy of their flowers, are now sought for with considerable zeal. It is commendable, too, for the beauty of such plants is not transient, but is ever growing, and is continually refreshing and lastingly attractive. Of this nature are Ferns, and of these the genus *Drynaria* possesses claims to cultivation.

The Drynarias are not to be seen in every collection of Ferns, yet for the various purposes to which this class of plants are devoted some of the species might fitly play a part. If a pendulous basket Fern is required *D. diversifolia* is particularly suitable, its beautiful green pinnate fronds, from 2 to 3 feet long, being very ornamental. *D. acronans* is a plant of more noble aspect, its fronds being large and spreading; it is worthy a place in all ferneries of any extent, and makes a nice specimen for exhibition. *D. quercifolia* is a distinct and attractive species.

Most of the Drynarias are suitable for planting on rock-work, their creeping rhizomes clinging to rocks or roots in a natural manner, from which the fronds spring freely. When grown in pots they should be potted high, and the rhizomes merely be pegged on the surface. They require a stove heat and moist atmosphere. The fronds of some of the species are contracted and fertile in the upper part, the lower fronds being distinct and barren, which gives to the plant a peculiar yet agreeable appearance, and adds a feature to their interest. This is well shown in our illustration, which is of one of the best species.

AMERICAN BLIGHT.—If "AGRICOLA" will mix in water quicklime and salt, and apply it with a brush, rubbing it well into the cracks, it will completely free his trees. It will, moreover,

free the trees from mosses, which favour the woolly aphid.—W. F. BADCLIFFE.

### THE POTATO CROP IN THE NORTH-WEST OF ENGLAND.

In the Potato districts of north-west Lancashire, Cumberland, and Westmoreland the present prospects of the crop are very cheering. Last year the disease in those districts was almost nil, so much so that in all the principal markets good sound tubers were sold at 6d. per stone of 14 lbs. This year a diseased Potato is scarcely to be found amongst the garden sorts, and field Potatoes up to the present time look very promising. Although we have had rather more than an average of rain, yet it has not been accompanied by intense heat, which

usually, following upon liberal rains and aided by rich manures, produces rot or disease in the Potato. My old opinion, some time ago enunciated in the columns of the Journal, remains still the same, that the disease in Potatoes may be arrested and overcome by simple and natural means—namely, by the use of moderate quantities of manure and the avoidance of rich stimulating manures, the following-up of the use of which have rendered both the soil and the tubers rotten.

Up to this time we have fortunately been free from the curl spoken of in the southern districts, and new Potatoes are selling in our markets at 10d. per 14 lbs., and it must be remembered that the season for them is with us only fairly commenced. By breaking up new Potato land, and allowing the old rich soils to exhaust their rottenness and regain their original state—by the use of almost dry farmyard manure, and by eschewing rich manures, which induce rottenness of both soil and Potato sets—a very few seasons would enable this useful ascendent to regain its former health. In all the vegetable products of the garden and the farm we have a

very plentiful season; and though some gardeners may regret that we have not had a sufficiency of warm sunshine to fully ripen fruit, yet we have more than compensating advantages in the enormous crops of both fruit and vegetables of every description, and the work of giving support to overladen trees has to be performed in every garden and orchard.

From the commencement of April up to the present time we have had constantly recurring showers alternated by days of sunshine, whilst ever and anon a day or two of winter-like severity would arrest too free growth. On the evening of Wednesday, the 14th inst., a cold east wind prevailed, which reminded us strongly of October. It continued throughout the night, but was banished by the next day's bright sunshine. The hay crop, a good breadth of which is now under cover, is the heaviest known for many years. Up to this

Fig. 10.—*DRYNARIA ACRONANS*.

time the food prospects for both man and beast are especially promising.—BETA.

### CHIPPING NORTON ROSE SHOW.

CHIPPING NORTON had never been associated in my mind with anything horticultural save James Betteridge and his Asters. It will henceforth be associated with the recollection of as pretty a little Rose Show as I have seen this season, with as enthusiastic a set of florists as I have met with for some time, and with people as hospitable and genial as, even amongst horticulturists, anyone might wish to be thrown into contact with. In order to prove my position let me, then, endeavour to describe their Rose Show, bearing in mind that it is a quiet inland town with about four thousand inhabitants. Now I do not call to mind any town of a similar size which, in addition to its ordinary horticultural show, goes in for a Rose show exclusively. Wimblesbury adds stove and greenhouse plants to its list of exhibits. Exeter is a city, and so is Hereford, and therefore do not stand in comparison with it; and this, I think, is a proof that it has an enthusiastic set of florists. The Committee offered upwards of £40 in prizes, and of sufficient value to tempt such growers as Messrs. Cranston & Mayors of Hereford and Mr. Prince of Oxford to come forward, while the amateurs of the neighbourhood mustered in considerable strength.

The Show was held in the charming grounds of The Mount, the residence of Mr. Wilkins the Mayor of Chipping Norton; and the tent in which the Roses were placed was well filled with excellent stands of blooms. Messrs. Cranston & Mayors's lot of forty-eight was remarkably fresh, and the blooms in it were large without being coarse. The usual fine Roses which one looks for in every stand were of course to be seen here, as were also Ferdinand de Lesseps, good; Madame Lacharme, clear and fine; and Sir Garnet Wolseley, rich and good in form. Mr. Prince's Roses were fine but coarse. It would seem from what I have seen that the seedling Briar has the tendency to foster coarseness, and will probably require less manure and less strength than the Manetti. There were some grand blooms of Claude Levet in Mr. Prince's stands. Mr. Corp of Oxford was a good third.

The keenest point of interest about the Show was evidently the contest for the cup given for twenty-four blooms in the amateurs' class, and which was awarded after a very close contest to Mr. Julius Sladden, the son of as staunch a florist as ever lived, well known to the horticulturists of the past as "A. S. H." the editor for many years of "Gossip for the Garden," and one of the earliest and most successful amateur cultivators of the *Gladiolus* in England. It is a pleasant thing to see the son treading in his father's footsteps, and it was no small pleasure to me as his old friend to award him the cup. His stand was a very even and creditable one, but he was run very close by Mr. H. Wilkins, in whose stand were some blooms much finer, but more than counterbalanced by those two wretches Henri Pages and Reine du Midi, which are well nigh sure always to deceive an exhibitor; their colour so soon flies, and they so soon become flaccid. In Teas a very beautiful box of smallish blooms was exhibited by Mr. Prince of Oxford, amongst which Comtesse de Nadailac and Marie Van Houtte were conspicuous. The premier prize for the best single Rose in the amateurs' class of twenty-four was awarded to Mr. Wilkins for a very beautiful bloom of Général Jacqueminot. How these old Roses are coming to the front this year! There were some pretty baskets and bouquets of Roses shown, but the rigid rule which proscribes any other foliage but that of the Rose might well be modified. Mrs. Betteridge exhibited a beautiful stand of blooms of hardy herbaceous plants, but of these more anon.

In the evening a dinner took place at the Crown Hotel, and after it Mr. Pryer the Treasurer announced his intention of giving a cup next year of the value of five guineas, to be competed for by amateurs. This announcement is another proof of the enthusiasm that exists amongst the horticulturists of Chipping Norton.

After the Show I went to visit the nursery grounds of Mr. JAMES BETTERIDGE. I ought to have done so under any circumstances, if only to apologise for having so deliberately killed him off last year; but I was anxious to see the home of the quilled Asters which bear his name and which he has made so famous. They were not, of course, in bloom, but they gave good promise of an excellent bloom next month, and they must really form a beautiful sight when these large patches of various colours are in flower, on the side of one of those hills which form Chipping Norton. Mrs. Betteridge, the worthy wife of a worthy man, is passionately fond of herbaceous plants, and has gathered together a very nice collection. Amongst those in flower were several fine *Delphiniums*, especially a seedling from *Belladonna* but more vigorous; *Pentstemon Torreyi*, *Campanula salicifolia*, *Veronica spicata* and *spicata alba*, and a dwarf variety of the same; *Campanula Van Houttei*, nobilis alba, and *Hendersoni*; *Spiraea venusta*, *Scabiosa caucasica coronata*, and *Myosotis Impératrice Elizabeth*, valuable not only for its colour, but as coming

into bloom when all others are over. She had also some very nice specimens of British Ferns, and I was glad to find herbaceous plants so well done and so appreciated, and right glad to make the acquaintance of an honest man and a self-taught florist and his good wife. I am sorry to say I saw here unmistakeable proofs of the existence of the Potato disease, of which after this wet July I fear we shall hear much.

Being an early bird I took the opportunity of paying a visit before starting on my home journey to see Mr. Sabine, who is mad enough to prefer hardy herbaceous plants to flouting Geraniums and carpet bedding. Here I found many choice and valuable plants thoroughly at home, and I am not surprised at the favour with which this class of plants seems now to be regarded.

I think, then, that I have proved my position as to the enthusiasm of the Chipping Norton people about flowers; it behoves me to speak but little of the kindness which I experienced both from my kind host the Mayor and his family, and the various officers of the Society; from all with whom I came into contact I experienced the utmost cordiality, and rejoice that amidst this very dripping season they had a lovely day for their Show, and I trust that they may go on still prospering in the adventurous and spirited course they have taken for the encouragement of the queen of flowers.—D., Deal.

### CELERY IN WIDE TRENCHES.

MR. DOUGLAS being a cultivator of such acknowledged ability, everything he says justly carries considerable weight. On page 84 he says, in treating on Celery, that "where quantity is of more importance than quality it is better to plant in wide trenches;" but for Celery of "splendid quality" he recommends the single-row system. Now, I cannot see how a difference in the size of a trench can affect the quality of Celery, but I can easily understand its having an influence on size.

For a number of years I have grown Celery having for the main object quality, and, leaving undoubtedly good judges to decide on its merits, I have had a fair share of success. Now, the Celery which, for table use, has been so highly appreciated has been grown in wide trenches of four rows in each, and the sort Turner's Incomparable. With this sort, and by that mode, I could obtain a greater table quantity of high quality than I could by any other sort or plan. I could grow a larger quantity, using other sorts, but it was quantity to trim away and go to the rot-heap.

Clean, sweet, crisp heads a foot in length are sufficient for a gentleman's table, and big Celery I hold to be as great a mistake as is the aim at big Cucumbers. It is devoting labour, space, and manure to not a profitable end. For exhibition and market purposes the case is different, but for home table use I hold that the best quality of Celery is found in small and not large heads.

The secret of having good Celery is in an abundant supply of water and not earthing-up by dribbles. Celery will blanch in one month as well as in three, and the longer it is earthed the more liable it is to become cankered. Dwarf Celery is more productive of suckers than is the tall-growing Celery, and special care is necessary to pick-out these sucker eyes at the time of planting, and, above all, not to plant deeply.

The blister fly cannot be killed except by hand-picking, but it may be prevented. Watch for the first blister and then keep the plants dusted with soot for three weeks. I have had one row which was not sooted ruined, and those on each side of it almost uninjured. That was to test the effect of soot and to prove its worth. Soot and soot form a capital mixture for Celery—the one conveys food and the other retains moisture. I advise as the most economical mode of growing Celery for table use the dwarf-growing sorts on the wide-trench system.—A SURREY GARDENER.

### POROUS GARDEN POTS.

As the author of the article entitled "Clean versus Dirty Pots," which I communicated to "The Gardener," and which has occasioned the present discussion, perhaps you will allow me to say a few words in reference to an "EX-EXHIBITOR's" remarks in last week's issue on the same subject. In the first place, I may state that I quoted Dr. Lindley, and the adaptability of glazed or glass pots, &c., for plants, to dispose of the common argument that dirty or unwashed pots were unsuitable for plants, because the dirt choked the pores of the earthenware, not thinking of discussing the question of porous versus non-porous pots, believing that question to have

been already settled. Dr. Lindley's words are as follows:—"Experiment has, however, settled the question by showing that plants will grow in glass, in slate, in glazed earthenware just as well as in soft-burnt pots, and it is now admitted on all hands that if plants are ill-grown it is the fault of the gardener, not of the pot, whether it be hard or soft." My own experience, I must say, so far as it goes entirely confirms Dr. Lindley's remarks, and the stress "Ex-EXHIBITOR" lays upon careful watering under any circumstances does the same.

Your correspondent no doubt relates his candid opinion on the subject, and with much that he says I agree; but after reading his paper carefully through it becomes apparent, I think, that he is generalising rather than recording the results of experiment carried out with a definite object; and his attempt to classify those plants that prefer the different kinds of pots is, to say the least, open to criticism. As regards washed and unwashed pots, I must say that after experimenting with both side by side, and under equal conditions, I am unable to note any appreciable difference. I have experimented with such things as Pines, pot Vines, Heaths, Genistas, Acacias, Fuchsias, Cyclamens, Primulas, Ferns, Cinerarias, Balsams, &c., and have, therefore, no vague opinion on the subject. "Ex-EXHIBITOR" says, "The practice of general cultivators is overwhelmingly in favour of clean, well-finished pots as the best for plants generally." Now, though your correspondent makes this his crowning argument, it is a most unfortunate one for his case. "General practice" has been so often and so completely controverted by experiment, that I think it should never be used as an argument at all. I can remember when general practice was "overwhelmingly in favour" of striking bedding Geraniums in bottom heat, until someone proved they did better out of doors; also when it was the general practice to grow Pines three years before fruiting them, till somebody set the example of fruiting them in less than half that time and with much better results; and lastly, up till quite recently it was the general practice and belief that Vines required a temperature of from 70° to 75° to set their fruit, until it was demonstrated that such temperatures were neither desirable nor necessary. In all these things and many more, "general practice" has been quoted, formerly as an argument in their favour, but we now see it was only to mislead, and the pot question will most likely have the same fate.

To return to non-porous pots of slate, glazed earthenware, or iron, &c., I may state that Mr. Thomson of Drumlanrig grows a great variety of stove plants in glazed pots with perfect success, and contemplates extending the practice to all his moist houses to save washing, the price of the pots being the only obstacle apparently to his using them generally. The writer can testify that Mr. Thomson's stove plants were marvels of good health before he discarded the common pot, and he is not likely to adopt a less successful practice, one would think. The same cultivator states that tree Ferns and other plants are to be seen thriving well in galvanised-iron tubs in the Kibble conservatory at Glasgow, and reminds us that a former successful prizetaker at the London Pelargonium shows grew his plants in slate tubs. I have seen first-rate examples of window plants grown in glazed teapots, jam jars, and such like.

The Camellia is perhaps as fastidious a plant to grow in pots as any, and it does well enough in non-porous pots. Most of the fine Camellias at Dalkeith Palace grew in slate tubs when I was foreman there under Mr. Thomson, and they had been confined to these tubs for years, and are yet for anything I know. At the same place I had also charge of one of the finest and most extensive collections of Cape Heaths in Great Britain, and can therefore say something about their watering, which "Ex-EXHIBITOR" considers a critical matter; and I am prepared to maintain that if such a plant is apt to be overwatered in a slate pot, it is more apt to be under-watered in a porous one, for I have seen more Heaths injured from being stinted of water than from any other cause. I discovered this in the course of daily practice in the Heath house and the nursery pits. During summer all the soft-wooded species used to be put out of doors behind a north wall to prevent too much evaporation from the pots, and the smaller plants were plunged in ashes for the same reason, and always with the best results.

As regards Orchids, I am not aware it has been proved that such varieties as prefer pots will not do well in glazed pots. Will your correspondent state where the experiment has been made, and when? My object originally in stating that I considered

a dirty pot was as good as a clean one for a plant, was to lessen the hesitation against using the former when the time lost in washing would be a questionable gain. Where I was a learner all pots were washed, even for the bedding plants, which amounted to something like 150,000 in number, and the time occupied at this work was enormous. For such stock washing is never thought of here—not even dry scrubbing, unless the pots are very bad, and our bedding stock looks always as well as any other that I see; and as regards other subjects, what on wet days do not get washed are left undone; for we still wash, but chiefly for appearance sake, where the pots are seen.—J. SIMPSON, Wortley Hall.

## SHADING AND TEMPERATURE.

As the subject of shading is at no time so important as after a period of dull weather, and as the danger of injury by the sun's rays is then greater than at any other time, the following able remarks, which we abridge from "The Gardener," will be seasonable:—

"We are glad to observe that differences of opinion are cropping up here and there, now and again, in the horticultural press, as to the necessity or non-necessity of shading certain plants and fruits from tropical countries when grown under glass in this variable and comparatively sunless island. Opinions and directions the most opposite are expressed and inculcated by different writers, all of whom may be—and we are inclined to think are right—looking at the question of shading from their own several stand-points. There cannot be a doubt that the less some plants—we shall say, for instance, the Pine Apple—are shaded in this country the better, and the more shall the absence of any artificial shading correspond with the conditions of its native home. But then there are other conditions which are also so thoroughly artificial, and in some respects injurious to combat and counteract, that we hold with the opinion that at certain times, and especially in certain localities, the slight shading of Pines is a positive advantage.

"We can understand how a most successful cultivator of the Pine Apple who has never practised, let us say, north of London, should ridicule and condemn the idea of shading a house full of young growing Pines so early in the season as April and May. He has practised only in the sunny south, and has not had any experience of fruit and plant culture in the more fitful and cloudy weather of the north; and paradoxical as it may seem to some of our readers who have not practised under both such conditions, we unhesitatingly affirm that shading Pines, for instance, is more necessary in a Scotch valley, where cloud and mist prevail, than in a county, say, south of London, where such a state of the atmosphere is more rare, because the sunshine is more steady and fierce. But to cite localities so far apart is not necessary. When we grew Pines under the more steadily sunny sky and clear atmosphere of East Lothian—which, by the way, develops the colour of flowers to a purity and brilliancy we never witnessed elsewhere—we very rarely or never shaded them; but on coming to the region of cloud and mist in Upper Nithsdale, we very soon found that Pines would be ruined if we did not resort to more shading than ever we had applied before. And how does this happen? the cultivator of the south may ask. It happens on this wise. In the one locality there prevails a comparatively steady sunshine and clear atmosphere, and under these favourable circumstances Pines begin and continue their growth; the tissues of the plants are in consequence built up in such condition that sun does not brown or stunt them. Under the influence of dull wet weather that sometimes continues for weeks, the plants, in spite of anything that can be done, if they are to grow at all, make a growth comparative soft and watery, and to the inexperienced eye look well; but out comes Sol with a sudden steady blaze for some days, or even weeks, two or three days of which turn the green leaves, that may not have seen his face distinctly for weeks, into a foxy brown that curve and turn up into something like spouts of brown vegetable fibre, and the result is that their growth is seriously checked. To obviate this, the effect of sudden and bright sunshine after a continuance of dull damp weather, the sun's power must be broken and not allowed to act on the plants that are ill-prepared for so sudden a transition; and slight shading is therefore applied for some hours during the hottest part of the day, and is discontinued by degrees as the plants become inured and benefited instead of injured by it. Shading is an evil, we admit, but in the choice of evils it is the least of two; and if those who have not practised under these circum-

stances can tell how to do without shading, it would be regarded as a triumph over unfavourable circumstances. Until they can do this they ought to modify their condemnation of shading material in the case of not only Pines, but Melons, Cucumbers, &c.

"Looking at the practice of hothouse-shading in general, it strikes us that there is not a little that calls for alteration or reform. One learner does not shade his Pines under any circumstances, because another and more advanced looks at shading from one point of view and condemns it, and so the former has his Pines browned and stunted into the very picture of misery, and he wonders what is the matter. The latter founds his instructions primarily on the fact that the Pine is a native of a far brighter climate than ours, and partly from his own experience under more favourable circumstances, and forgets that circumstances may very much alter cases. Then, rushing to another extreme, Orchid houses and plant stoves are shaded with some thick dark brown material laid in close contact with the surface of the glass, that gives very little air and far too much heat, and so suffocates the plants till they become not healthy growths, but mere attenuations of vegetable tissue, and yield a very small proportion of weakly blooms. A very important step has been gained in a better knowledge of the temperatures suitable for plants which come from the higher altitudes of very hot countries; but it strikes us that we have fully as much yet to learn in reference to the amount of light, and shade, and air, which many of our hothouse plants will not only bear, but from which they will be actually improved and invigorated. The general dissemination of data on this point is manifestly defective. At all events, shading, as practiced in many cases, must be regarded as an evil carried to unnecessary excess; and there can be no doubt a more moderate application of the principle would result in improved cultivation. A thick dark-coloured shade is rolled on in close contact with the glass; from its texture it excludes too much light for the generality of Orchids and stove plants; from its colour it absorbs instead of reflects the heat of the sun, and so the object of keeping down the temperature of the air enclosed in the house is frustrated; and from its close contact with the roof it almost hermetically seals it, except at the ventilators proper, which have to be unduly opened to keep down the heat, and the consequence is a violent rush of air and moisture in one direction, which is most objectionable. Look at Orchids under so dense a shade and in so stewing an atmosphere, and it will be found that such as *Vandas* make weakly, long, drooping leaves, and next to no bloom-spikes. Now, if a light-coloured and thinner texture were used for shade, and it were at the same time raised a few inches off the surface of the glass so as to admit of an intermediate current of air, the temperature inside would be kept cooler, and the ingress and egress of air would go on at the lapse more, and there would be less cause for a violent rush of it at any given point, and a better atmospheric condition would be the result.

"Indiscriminate and constant shading of certain numerous plants the whole summer has long been a fashion, and is a practice manifestly open to question. The object of shading our too often very small glass houses is certainly to modify temperature and evaporation as well as light; and it may not be too much to say, that if the former could be more fully accomplished, and the latter secured in less degree, plants would benefit immensely. Considering, as we do, this to be a most important subject for the interchange of facts and suggestions, we have made the foregoing remarks with the view of eliciting the views and experience of our readers and correspondents. Any society or individual that could afford thoroughly to test more minutely which plants are benefited and which are injured by our present system of shading, would deserve well of the horticultural world."

#### NOTES AND GLEANINGS.

We have great pleasure in announcing that the Council of the Royal Horticultural Society have concluded terms with HER MAJESTY'S COMMISSIONERS of the International Exhibition of 1881, and that the terms are alike fair and equitable to both parties, the Royal Horticultural Society being now placed in such a position as will enable it in the future to pursue its course untrammelled with conditions which formerly impeded its freedom of action.

— We learn from various sources that the continued RAINS have caused great injury to the small fruits. Straw-

berries and Raspberries have rotted, Cherries have cracked, Gooseberries are bursting on the trees, and Currants are levelled to the ground. The loss must be very great to growers in the districts where the wet and boisterous weather has been the most prevalent.

— THE medal which was awarded to Mr. Worthington G. Smith for his discovery of the Rusting-sporium of *Phenosporea infestans* in the tuber of the Potato was the Gold Knightian, a more valuable award than the Gold Banksian.

— We have received from Mr. R. Gilbert of the Gardens, Burghley, a box containing some of the finest-grown and best-ripened Figs we have ever eaten in this country.

#### THE OLD MARKET GARDENS AND NURSERIES OF LONDON.—No. 8.

Or the land which was at the disposal of ecclesiastics in the reign of the eighth Henry, there was the convent of the Black Friars near the Thames at Ludgate; the Grey Friars in Newgate Street, near the site of Christ's Hospital; the Augustine Friars close to Broad Street, now shortened to Austen Friars; the White Friars, in or near Salisbury Square; the Crouched, Crossed (or as it is now distorted "Crooked") Friars, in St. Olave's near Tower Hill; the Carthusian Friars at the Charterhouse; the Cistercian Friars, also called the New Abbey, in East Smithfield; and some friars who called themselves the "Brethren de Sacca," in Old Jewry. These latter wandered about at times, I suppose to obtain contributions, with bags or sacks, or perhaps the word applies to a particular kind of robe or dress somewhat sacklike. All these probably had plots of garden ground; and besides these friaries there were nunneries and priories, also monastic houses still more in number called hospitals, with resident brotherhoods; and then there were the private domains of ecclesiastics, called by the odd name of Inn in many instances, as in Chaucer's immortal "Tabard Inn," once the residence of the Abbot of Hyde.

Air, shelter, and water are indispensable requisites of the horticulturist, and the old gardens of London City were well favoured in these respects. They had plenty of air necessarily, from the scarcity of buildings at that time; and those then erected were clustered together, too, in an insalubrious way for their occupants, yet they less interfered with the successful culture of the gardens and orchards than if they had been dispersed over a larger space or carried up higher. But lofty houses were exceptional. The forests of Middlesex and Essex gave a capital screen from the north and east winds, and the moisture that must have been present in the air more or less at all times could not have been unfavourable. This arose from the fenny lands, such as are kept in remembrance by the names of Fenchurch, Finsbury, and Moorfields; while to the south much of Westminster and Lambeth was marsh, and the road that Royalty had to travel to Chelsea and Kensington was execrably bad, being both miry and stony.

Nor should it be forgotten, when we are considering the gardens of the London of our ancestors, that the land in the central districts has undergone a notable elevation. Five hundred years since, or four, three, or even two hundred years ago, would exhibit it to us more undulating than at present, but on the whole much lower, and therefore well sheltered. Beneath the clay and loam, which with an occasional dash of gravel constituted the subsoil, there was an abundance of water, as shown by the numerous City wells; so that it need not surprise us that the fruit trees bore well and ripened their fruit in most seasons, and that London was actually noted, not only for its Vines but for its vineyards. Holeburne, or the "Old Bourne," a rather famous streamlet in its day, which has disappeared, leaving its name as a heritage to the mighty Viaduct of Victoria's reign, had vineyards along its banks. Vine Street in Westminster was so called from a vineyard close by attached to the king's palace of Westminster. But one of the most curious changes of name is connected with Vinegar Yard in the unpromising vicinity of Drury Lane. This was formerly Vins-garden Yard, so it is stated, though the vineyard had vanished and houses sprung up on the ground as far back as 1621. Ely Place, the town abode of the Bishops of Ely, had its vineyard and large gardens—altogether a very agreeable spot, as one understands from the description of it; and no doubt Bishop Cox, who had to relinquish it to Sir C. Hatton, Queen Bess's dancing Chancellor, thought himself hardly done by. Sir C. Hatton took the property in 1576, at

the very moderate and peculiar rent of ten loads of hay and £10 per annum. However, the Bishop reserved to self and successors the right of walking there and of gathering yearly ten bushels of Roses, if they could find them. A memory of this worthy and his estate lingers in Hatton Garden, with hardly a solitary tree left of all those that shaded its walks. Hiss also were counted amongst London produce. They "grew well near the Bridewell," writes one: this name applied to a district between Blackfriars and the Temple, arising from an actual well that joined its waters to those of the Fleet. The fruit ripened well in the Rolls Garden, Chancery Lane, says the same authority; and Fig-Tree Court in the Temple tells us of a tree of this sort.

The fertility of the gardens in London City was enhanced by the numerous streams intersecting the land in various directions and running finally into the Thames. Some, like the Fleet, were of magnitude, allowing of the transit of vessels of size; others so despicable as to be worthy of no appellation save that of ditch, Houndsditch for example. Langbourne, yet a London ward, reminds us of the long bourn or brook that rose in Fenchurch Street and divided into small streams near St. Mary Woolnoth, and giving name to Sharborne Lane from these shares or little rills. Turnmill Brook, or the "River of the Wells," at Smithfield was another noted stream, and the Walbrook, thought to have been known to the Romans.—J. B. S. C.

## NOTES ON VILLA AND SUBURBAN GARDENING.

### KITCHEN GARDEN.

For forty-eight hours it has rained incessantly, and after about six hours tolerably fine weather it rained again for twelve hours more. This constant rain has done considerable harm to the soft kinds of fruit, such as late Strawberries, Raspberries, and Currants, especially the best of the Black. The Currants especially suffered, all the best being knocked off the trees by the rain and wind in such quantities as to considerably lessen the crops. Cherries, too, of the Bigarreau kinds on standard trees have been battered about so much, and have cracked so much through the wet, that most of them are not worth the trouble of gathering. Apples where they have set much too thick have been well thinned by the rough weather; even now in the most exposed orchards about here there is a good crop of all kinds left, and which will now swell very fast after the soaking rains.

On the other hand, the rain has made a most material difference in the appearance of all sorts of vegetables, which if fine weather now set in will be most beneficial in all respects. It just suits Scarlet Runners and Dwarf Beans, as well as Cauliflowers, and especially Turnips, which if sown at the time I advised will now be starting free and well. Celery, too, has received a most material assistance through the rains, and like most other crops in the kitchen garden will do without watering for some time. Attention must now be turned to keeping the ground clear of weeds among all crops. This work should commence immediately after the weather has become settled dry for a day or two, because then the small weeds will have less chance of recovering again.

Begin to earth-up the main crops of Celery, which will help to keep the moisture in the ground about their roots, and add more earth to the forward rows. Take care in applying it to separate each plant and keep them well pressed together, so as not to be interfered with by the earth in the hearts.

Spring-sown Onions are growing very fast, and will after the heavy rains be inclined to make a good deal of top or foliage, perhaps more than is needed for a good-sized bulb, therefore I usually lay them down. It is done with a short pole, and will be found to check their growth advantageously. When the bulbs have more increased in size the tops may be further flattened, for they are sure to rise up again. This will assist them both in size and ripening-off. Autumn-sown Onions will be ripening-off now, and should be laid down at once—that is, the Giant Rocca and Globe Tripoli, but the White Italian Tripoli has been ripe some time and ought to be taken out of the ground after this wet.

Plant-out both Endive of sorts and Lettuces in good quantities on early Potato ground, and there could not be a better chance to plant-out all kinds of Savoys and Greens, as well as Sprouts of sorts, such as the Brussels and Albert Sprouts. Jerusalem Artichokes are making too much growth, therefore if the tips of the shoots are not pinched off they will go up 10 feet high or more in rich soil, and that is not the way to obtain fine tubers.

Sow another crop of French Beans. This may be a large one so as to afford a few for pickling, and should be of some early sort, such as the Dwarf Negro or Early Six-weeks. This sowing is best made on a south border or some other equally early spot. There is likely to be some good late crops of Kidney Beans. Peas have not so far yielded well with me this season; but

the taller-growing sorts, such as the Emperor of the Marrows and Giant Emerald Marrow, promise more abundantly. Sow a crop of Spinach, say a few rows of the prickly kind. By sowing now there will be an excellent gathering through the autumn, and in about three weeks make another sowing to stand the winter, and if necessary the other may be left to do the same.

Cabbages must be thought about, and at the end of the month a crop may be sown, and again in another fortnight. The first may be Cattel's Reliance, and the other Early York and Wheeler's Imperial, or Cocoa Nut. The first sowing may be planted 2 feet apart when large enough, and then the next sowing may be planted between them. This will afford the chance of taking-out the first lot for use during winter, leaving the others till the spring, or if not wanted they may be cut early in the spring. This is a means of making the most of the ground in small gardens, which must be a plan worth studying at all times, and, moreover, it is worth carrying out in every crop where it can conveniently be done.—THOMAS RECORD.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### KITCHEN GARDEN.

THE weather has been so unfavourable for out-of-door operations that there is but little for us to chronicle. Fortunately nearly all the small fruits have been gathered for preserving purposes, and all the rain that has fallen as yet will do good in the garden. A wet season is always the best for us, as the greatest rainfall during the last twelve years was but little over 25 inches during the whole year. So far we have not had more than the average quantity, but it has come at a time when we have usually had to do much watering out of doors by hand. The weeds will now grow apace, but when the rains are over the walks will be hand-picked, and all the borders and quarters hoed. Potatoes are turning out well. The variety called Veitch's Prolific Ashleaf is an enormous cropper and a second early kidney of fine quality. For a first early kidney we grew Myatt's Ashleaf (the tubers were kindly sent by "D., Deal," but after growing on the same ground and under very similar conditions for three years they degenerated, and none were saved for planting last year. It has not been found so easy to replace them, as the trade seem to grow a different variety for Myatt's, and one very similar to the Prolific Ashleaf. Certainly this early variety sent by "D., Deal," was the best first early we ever grew.

Broad Beans are not grown extensively anywhere now, but most persons like to have one or two dishes every year, and it is just as well to grow the best sorts for cooking. We have a superior type of the Windsor, and it is certainly the best Bean for cooking, as the skin is not at all tough. The true type has seldom more than two Beans in a pod, and if a large proportion of pods produce three the stock is said to be "running away." For exhibition purposes the *Seville Longpod*—a new sort introduced last year—is the best. It may also be as good or better than the Windsor for cooking purposes; if so it will be a valuable acquisition. It is said to be a tender variety, which may not be in its favour in cold districts; it is also doubtful if it will ripen in this country so as to produce seeds without the plant degenerating. At all events the best seeds will be those that are grown in Spain or Portugal and imported into this country.

Peas are producing abundantly; we have had none of what is called "dry-weather" Peas this year. All salads and green crops generally have been of good quality and abundant. A plentiful season is not always the best for the market gardener; in a season like this the produce does not fetch enough in the market to pay the expenses of taking it there. Peas have been known to be sold at 1s. 6d. a sack, and the cost of picking is 6d. a bushel.

During this wet weather it would be well to throw some guano, salt, or other fertilisers over Asparagus, Artichokes, and Seakale beds. Avoid throwing it over the leaves as much as possible; if the manure is washed off immediately the leaves will not be injured, but if it should cease raining and the guano be left on the leaves they will be injured.

### PINKETTES.

Before we again write under this heading the suckers will be potted, and will remain in 7-inch pots all through the winter and be repotted into fruiting pots in spring. They will not bear fruit until the following season from the 1st of June onwards. If good suckers are potted early in June, or, better still, in May, they can be grown-on rapidly, shifted into 10 or 11-inch pots in July according to the strength of the plants, and under good management these will throw up good fruit the following season. It is not convenient for us to do them in that way, as the beds cannot be ready in time for the succession plants. We always use fresh tan for the young suckers, as the pit is required for other purposes, and has to be cleared out of all plunging material for the greater part of the year.

The suckers are potted in good clayey loam as soon as they are removed from the plants, but they are not watered for a week

after potting. The temperature of the body of the tan generally rises to 110° Fahr. This will not be injurious, as the pots are small, and the heat 6 inches below the surface will not rise over 100°. This high bottom temperature soon causes roots to form, when the plants may be watered more frequently. In the early stages of their growth Pines require to be kept moderately moist at the roots. In the fruiting house, some fruits are ripe, and others are in different stages; from the flowering period until the fruit changes colour it is not easy to determine which is the best course of treatment. It is, perhaps, best to cut all ripe fruit and place it in a cool room; it will keep in this way for a whole month sometimes, whereas if the fruit is not sound when cut it will decay in a week. An overmoist badly ventilated atmosphere is the frequent source of fruit spoiling shortly after it is ripe, and such atmospheric conditions are not adapted to the Pine at any time.

**Oranges.**—The fruit is now rapidly swelling on the pot trees. Those plants that have not been repotted require to be surface-dressed during the present month. We mix pounded charcoal, bones ground to powder, the best Peruvian guano, and loam in equal proportions. Two handfuls of this placed on the surface of a 12-inch pot three times during the growing season have a magical effect on the plants, causing the foliage to become of that dark green colour indicative of robust health. Mr. W. Paul's Rose manure has a similar effect upon plants when applied in the same way. Those trees that have no fruit upon them have been repotted and are placed out of doors. They will make nice specimens for fruiting next season. Two-thirds yellow loam and one-third turfy peat, with a sixth part of rotted manure, is the best compost for Orange trees in pots. The best sorts to grow are Tangerine, St. Michaels, and Maltese Blood.

**Figs.**—The fruit is ripening on the pot plants in the Cucumber house, and to prevent its cracking it is necessary to maintain a drier atmosphere, and not to apply too much water to the roots. Many of the fruits have cracked, or rather have split up the centre, exposing the internal part before the fruit is quite ripe. The Fig is a gross feeder, and is even more benefited by rich surface dressings than the Orange. Young plants struck from eyes or cuttings should be potted on before the small pots in which they were potted are too full of roots. By good management a tolerably-sized bush can be formed in two seasons, which will bear a good crop of fruit in a 12-inch pot the third year.

#### PLANT STOVE AND ORCHID HOUSES.

Considerable attention is now required in this department. Nearly all the different species of hardwooded plants have either completed their growth or are in a fair way of doing so, they consequently require more light and air. A large proportion of other stove plants are grown for their foliage. *Stephanotis floribunda*, *Ixoras*, &c., may stand in the full sun with advantage. If the wood is well ripened at this season abundant produce of well-developed flowers will be the result next season. If any require to be repotted this ought to be done at once. Sometimes it is necessary to reduce the ball of roots and repot in the same sized pot. This can easily be done by working round the sides of the ball with a pointed stick and loosening the mould which falls out from amongst the roots. There ought to be a space of from 1 to 2 inches all round the ball, between that and the sides of the pot the fresh mould should be carefully worked in amongst the roots.

All plants of a quick growth that are best propagated from cuttings annually should be potted on at once; if allowed to become rootbound all the foliage suffers, and some of it drops off. Of this class of plants may be named *Thyracanthus rutifolius*, *Eranthemum*, *Impatiens*, *Torenia asiatica*, &c. Old plants of the above will grow and flower well, but where the houses are small nice young specimens propagated from cuttings struck early are the most useful. The plants should be grown near the glass. *Centradenia floribunda* and *C. grandiflora* are also very useful winter-flowering plants that may be managed in the same way. They flower abundantly all through the winter and spring months. All of the above are of the easiest culture.

Wash Orchids with soapy water to destroy white scale and thrips. These two pests are very troublesome to Orchid growers. The white scale finds a home under the thin skin covering of the pseudobulbs of *Cattleyas*, *Lælias*, &c., and cannot be destroyed without removing this covering, which is injurious to the plant. Thrips get into the heart of the growing shoots of many Orchids, and they are not easily reached by any application. Tobacco smoke does more mischief than the thrips if not carefully applied, and it is not possible to reach them by washing. It is a good plan to lay the plants on their sides and syringe them with tepid water. All the Orchids have been surface-dressed or repotted.

#### FLOWER GARDEN.

Zonal *Pelargoniums* of the flowering type, *Calceolarias*, *Verbenas*, and, indeed, all flowering plants, have had the flowers very much damaged by the rains, while plants grown for the effect produced by the foliage are much improved thereby. Saturday afternoon was fine, and the mower was run over the lawn, the walks were also swept and the weeds picked out.

Placed sticks to plants which required support, and looked over *Phloxes*, *Gloves*, &c., and fastened them to the sticks. We have commenced to bud *Roses* on standard *Briars*, and also on the dwarf seedling. Sad accounts are given in the daily papers of the damage done by the heavy rains. It was stated at the meeting of the Metropolitan Board of Works last Friday that the rainfall on the two previous days was 2½ inches in London. At Loxford the measurement was on Wednesday, 1.81 inches; Thursday, 0.81; Friday, 0.81. Total 2.43 inches.—J. DOUGLAS.

#### TRADE CATALOGUES RECEIVED.

Mr. Wm. Bull, King's Road, Chelsea.—*Illustrated Catalogue of Plants.*

Mr. Cannell, Woolwich.—*Pamphlet on Heating.*

Mr. Ch. Vuylsteke, à Locochristy, near Ghent, Belgium.—*Priced List of Asaleas, Camellias, and Rhododendrons.*

#### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

BRECON.—July 22nd. Mr. W. J. Roberts, Sec.  
HELENBURGH, N.B. (Rose Show).—July 23rd and 24th. Mr. W. Ure Waddell, Sec.  
CLECKHATON.—July 24th. Mr. S. H. Williamson Hon.-Sec.  
BRIDGE.—July 27th. Mr. E. Hardeman, Hon.-Sec.  
PRESTON.—July 28th and 29th. Mr. W. Troughton, 4, Church Street, Hon.-Sec.  
SHEFFIELD.—July 29th and 30th. Mr. H. W. Adnitt, Hon.-Sec.  
SOUTHAMPTON.—July 31st and August 2nd. Mr. C. S. Fridge, 32, York Street, Lower Avenue, Sec.  
SEDGELY (Cottagers).—August 3rd. Mr. W. M. Hughes, Sec.  
WESTON-SUPER-MARE.—August 4th. Mr. W. B. Frampton, Sec.  
ILKESHTON AND SHIPLEY.—August 4th and 5th. Mr. E. Blount, Sec.  
NEWPORT (MONMOUTHSHIRE).—August 5th.  
OTLEY.—August 7th. Mr. Jno. Lee, Hon.-Sec.

COVENTRY (at Ocombe Abbey).—August 17th. Mr. T. Wigston, 3, Portland Terrace, Sec.  
DOVER.—August 18th.  
NORTHLEACH.—August 18th. Mr. J. Walker, Hon.-Sec.  
EASTBOURNE—in the Devonshire Park.—August 19th. H. A. E. Ramble, Esq., 26, Hyde Gardens, Sec.  
GLASTONBURY.—August 19th. Rev. E. Handley, Hon.-Sec.  
PONTIFPOOL.—August 19th. Mr. Ernest Deacon, Hon.-Sec.

#### TO CORRESPONDENTS.

\* \* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (X. Y. Z.).—The "Cottage Gardener's Dictionary" will suit you. It can be had from this office for 6s. 6d., or 7s. 2d. by post.

LILYUM BLOOMERIANUM (Wm. Hilloak).—This is synonymous with *L. Humboldtii* of Roel. It is a native of California, and is found on the lower hills of the Sierra Nevada at an elevation of 2500 to 3500 feet. It attains the height of 4 to 6 feet.

POTATOES (Rev. A. Blythman).—We would gladly assist you, but we could not undertake to name Potatoes.

COCOA-NUT FIBRE REFUSE (T. G. D.).—It is very useful as plunging material, and cuttings of most kinds of plants strike in it freely; but for making hotbeds it is not a fermenting material, leaves and tan, separate or in combination, being far preferable.

STRAWBERRY FORCING (T. White).—The plants may be forced in the frames as you propose, but the earthenware pipes of but 6-inch diameter would be liable to choke with soot, and be an inefficient mode of heating. A 2-inch hot-water pipe all around the frames, and if you have two 4-foot frames together there need be no partition, and one pipe where the division would otherwise be would be sufficient, or three rows for the part which is 8 feet in width. The frame along the greenhouse would hardly have sufficient heat to be considered as "forcing," but the Strawberries would come in several days before those in the open ground. The old plants in the bed are no good for forcing. You should at once layer in small pots runners from plants which are bearing or have borne fruit this season, and when these are well rooted detach them from the old plants and place in a rather shady position for a few days, and then transfer to 6-inch pots, potting very firmly, and using rather strong turfy loam, with a fourth part of old manure added. Stand the pots on a hard bottom in an open situation, and keep them well supplied with water, removing them to the frames early in November. As the season is far advanced we should fill the 6-inch pots and layer the runners into them, keeping them supplied with water, and not detaching them from the old plants until the young plants are strong and well rooted. In estimating the value of produce you will need to allow a large margin or contingencies. A dozen

pots may give you 1½ lb. of fruit, or it may be considerably less, and what is wanted is fine large fruit. Small, though there be as much weight for weight as of finer fruit, is always at a great discount; six or eight large fruit to a plant will be worth twice as much as four times that number of small fruit. The pots we should stand upon the soil, with no pecking of any kind between the pots, as the plants level in air playing about them. Three rows would be sufficient for a frame 4 feet wide. The kinds most likely to answer your purpose are Sir Joseph Paxton and President. The runner next the old plant is, of course, the first runner, and any beyond it should be cut off directly beyond the runner layered, and all runners from the young plants should be removed as they appear.

**BRITISH QUEEN STRAWBERRY ON LIGHT SOIL (C. Y.).**—It would be necessary to trench your soil as deep as you can without bringing up more than a few inches of the poor subsoil, and at the bottom of the trench apply the manure rather fresh—i.e., about half rotten, and fork it in before applying the soil of the next spit, which should be mixed with an equal proportion of marly clay, and upon this again manure, mixing it by a good forking-in with the soil below; and you may finish the bottom spit, which will be the top soil of the first trenched part, in the same manner as the first, applying to the surface a dressing of old manure and forking it well in. Allow a few days, or better until after a good rain, and the ground being in good working order tread it the same as if you were going to grow Onions, the harder the better. The surface after planting to be only lightly stirred in the spring, and well manured in the autumn. There is reason to conclude that with liberal supplies of water in dry weather after flowering you will have good crops of fruit.

**RASPBERRY (Idem).**—Prince of Wales (Outbush's), is a most excellent Raspberry; Carter's Prolific and Fastolfe are both good. "With light soil, deeply dug, well manured, and mulched during hot weather," you ought to obtain exhibition fruit, but you omit one essential—viz., watering before applying the mulch, and afterwards if dry weather ensue to continue the watering and insure fine fruit.

**GRAPES MILDEWED (B. H. Merrett).**—If the mildew is killed wash off the sulphur at once. Do not diminish atmospheric moisture until the Grapes commence to colour, but be careful to admit a constant current of air night and day. Do not damp the house late in the afternoon, and do not close entirely at night. Early and sufficient air is the best preventive of mildew. In dull weather you will not need to use much moisture in the house; it is only on sunny days that frequent damping will be necessary.

**VINES UNFRUITFUL (Old Subscriber).**—We are inclined to think that you have kept your house too close, as the leaf sent us is scalded. We further think the wood of your Vines was not sufficiently ripened. The side shoots which spring from the main stem of the Vine should not be closer than 15 inches apart on either side of the rod. Every leaf is then accessible to the light, and if sufficient air is admitted the texture of the foliage will be stout instead of flimsy, which is the case with the leaf you have enclosed. Thin out the shoots to that distance apart, stop the shoots so that one leaf does not overlap another, pinch out all laterals as they appear, admit plenty of air, and if the weather is dull after the Grapes are out apply fire heat; the wood will then be perfectly hard and ripe by the autumn, and Grapes will follow. The roots may also have penetrated too deeply. On this point see our reply to "East Yorkshire."

**SHRIVELLED GRAPES (A. B.).**—Your Vines are in a deplorable state. The cause of the shrivelling may be traced to the "cutting away of the young growth by armfuls after the berries were thinned." It is a barbarous practice, and frequently causes a corresponding decay of the roots by the check they received reciprocally with the mutilation of the branches. If your Vines are bearing a heavy crop relieve the pressure by cutting out entirely all the worst bunches. Allow the laterals to grow to restore the sluggish root action, yet not to grow to a thicket, but stop them soon enough to prevent overcropping. Undue crowding of the foliage should be prevented by timely pinching, and not be encouraged by a let-alone policy of several weeks' duration to culminate in a grand slaughtering day. Admit air, and use atmospheric moisture judiciously; leave the top ventilators slightly open all night, and especially increase the air as soon as needed each morning. By this treatment the injury to your Vines may not be permanent. You may report their condition in a month, when possibly we may be able to give you further advice founded on their condition at that time.

**GRAPES MILDEWED (D. G.).**—The cause of mildew is mainly ascribed to a wet border, a low wet site, and a too close and moist atmosphere; but we have known it prevail under opposite circumstances. Dust the infested parts, both leaves and fruit, with flowers of sulphur, and admit air more freely, especially at night.

**VINES UNHEALTHY (East Yorkshire).**—If the roots of your Tokays had descended into the subsoil, and so caused the injury of which you complain, we think the Black Hamburgs would at least have been similarly injured. We think the mischief is caused by the red spider. We hope you sent us the worst leaf you could find, for it is literally devoured with the pest. Drench the foliage thoroughly with pure water, applying it forcibly to every leaf, evading as much as possible the bunches. By three thorough washings on alternate days and the treatment you are otherwise adopting you will eradicate the pest. At the same time it would be well to remove the surface of your border, laying bare the principal roots, and replace with charred refuse and lighter soil, covering them about 4 inches, and over this place 5 or 6 inches of good manure. This will enrich the surface and tend to promote an emission of fresh roots. Rich surface soil is the best means of preventing the descent of the roots into the subsoil. You may do this at once, taking care that the roots do not become dry by exposure. But with the best care of the roots you cannot hope to obtain Grapes unless you wage a successful war against the red spider. This year the nutriment of the border has been appropriated by the insects instead of by the Vines. We shall be glad to give you the best aid we can at any future time when you feel we can be of assistance.

**PLANT AFFECTIONS (S. E.).**—The Hollyhocks are severely affected by the new disease, *Puccinia malvacearum*, which reached this country from France two years ago. In the number for May 28th, 1874, may be found a full illustrated account of this disease. Washing every individual leaf with a strong solution of soft soap might check the growth of the fungus, but we fear the only way of eradicating it is to burn the plants. The Rose leaves are affected with the orange fungus, *Uredo rosea*. Syringe the shoots with a solution of soft soap of a strength of 8 ozs. per gallon at a temperature of 100° to 120°, then dust with sulphur. The diseased shoots from your Pear tree suggest that the soil is insufficiently drained. Draining the soil and the encouragement of surface roots by rich top-dressings is the treatment we recommend.

**FIG TREE FOR SOUTH-WEST ASPROT (A Cottage Gardener).**—It is as you are informed a good covering for a wall during the summer, having large handsome foliage; but, losing its leaves in winter, is not so desirable as even Ivy, unless account be taken of its fruit, which it is likely you may in your mild climate secure upon a south-west wall. The kind most likely to succeed is the Brunswick, a plant of which you may obtain of most nurserymen at a moderate price. The best mode of training is the fan, training so as to cover the wall with branches and shoots, having the latter about 9 inches distance apart; and the only pruning required is to cut-out the long, bare, old branches in spring, after the trees become crowded, and replace them with young bearing wood. A rather light and open soil is best and only moderately rich, for in rich soil the tree goes too much to wood, affording little fruit.

**HOUSE FOR CUCUMBERS (Amateur).**—If you sink the house 2 feet the necessity for so much brickwork above ground will be avoided, and for affording bottom heat and for the bed you will require a depth of about 4 feet. We should have about 2 feet of side lights, and to open all the length on one side, or every other light on both sides. The width being 12 feet with borders along each side with two rows of 4-inch pipes to each border and on a level, and 18 inches below the level of the surface of the beds, which we should have on a level with the brickwork, forming the sides of the bed inside or 8 feet from the floor, the external walls being 9 inches thick, and a foot higher as before stated. Leave 3 feet in the centre for the path, and the beds of equal width on both sides. Allow a fall for the roof of 4 feet 6 inches calculating from the eaves. Hot-water pipes as a mode of heating are vastly superior to fires, and cheaper in the long run, though more expensive at first. You may calculate on having fruit ten months out of the twelve, and this allows a month for each renewal of plants, the plants being raised in pots and planted out when strong. As to produce, that depends upon management and kinds. Under good management you should out a thousand, and that is allowing a large margin for mishaps. Cucumbers are easily managed, nothing but what an amateur may soon learn.

**CUCUMBER FAILURE (D.).**—We think you have a mild form of the disease, and should at once clear out the plants and soil, giving the house a thorough cleaning. The description you give of your plants accords well with the disease for which there is no remedy, and the plants from the gangrene you name will not give you fruit of good quality should they recover, hence we advise their removal. Plant in turfy loam taken where the soil is light rather than heavy, and use this broken up fine without admixture of any kind, applying what manure may be required to the surface after the plants are in a bearing state. The soil you have been using appears worn-out garden soil.

**SEEDLING ASPARAGUS IN OLD BED (M. P. A.).**—The young plants will do no harm in the old bed, but will be good for filling up vacant space; but they should be thinned to at least 9 inches apart, and kept that distance from the old plants, removing all the others. By removing the old "grass"-bearing berries in autumn so soon as the leaves are cast or it becomes yellow you will remove the danger of a further increase of seedlings, as the seeds will adhere to the haulm producing them.

**ROSES BUDDED ON MANETTI SUCKERS (Idem).**—Your only plan will be to wait until November or early in December, and then take up the suckers with the Roses upon them, preserving to the suckers about 4 to 6 inches of root-stem, and then plant so that the junction of the Roses with the stocks will be about 8 inches, not more, below the surface. They should be pruned-in to 4 to 6 eyes from the soil, according to their strength, in February.

**STANDARD ROSES (M. O.).**—John Hopper, Charles Lefebvre, Alfred Colomb, La France, Mme. La Baronne de Rothschild, Dupuy Jamin, Boule de Neige, and Mme. C. Joigneux. If you can do with these as pillar Roses or strong dwarfs we can recommend them in preference to standards. We have named eight distinct in colour, and good in habit and growth.

**AZALEAS AND RHODODENDRONS FROM CUTTINGS (H.).**—Our reply refers to hardy kinds. Take the cuttings of the current year's growth when the wood next the old wood is nearly ripe, and insert them in sandy peat covered with an inch layer of silver sand in a shady or north border, and cover with a hand-light, or they may be inserted in cold frames. They require to be kept close until rooted, which is facilitated by, after the cuttings have formed a callus, placing them in a gentle bottom heat. After they are rooted admit air freely.

**HARDY PERENNIALS (Mas).**—*Aquilegia vulgaris* (seed), *Campanula rapunculoides* (division), *Convallaria majalis*, *Lily of the Valley* (division), *Daphnium Belladonna* (seed and division), *Pink* (seed), *Carnation* (seed), *Helleborus niger* (division), *Hemerocallis flava* (division), *Iberis Garziana* (cuttings), *Iris germanica* (division), *Dialytra spectabilis* (cuttings and division), *Lilium auratum*, *Lychnis diurna flore-plena*, *Myosotis dissitiflora* (seed and cuttings), *Narcissus Ajax maximus*, *N. poeticus plenus*, *Paeonia officinalis rubra plena* (division), *P. albiflora fragrans* (division), *Phlox decussata* var. (seed, division, or cuttings), *double Primrose* (division), *Pyrethrum*, *double* (seed and division), *Saxifraga longifolia vera* (division), *Schizostylis coodinea* (division), *Sedilla alba*, *Sisyrinchium grandiflorum* (division), *Spiraea alipendula plena*, *S. japonica* (division), *Trollius europaeus* (division), and *Violeta Victoria Regina*, *Queen of Violets*, and *Neapolitan* (suckers and runners).

**FRUIT TREES NOT BEARING—KINDS FOR NORTH-MIDLAND COUNTIES (B. S.).**—The unfruitfulness of the trees is probably attributable to too free growth, for which the most likely course to pursue to secure fruit would be to lift them in the autumn after the leaves have fallen. *Apples* that would suit your locality are, *Dessert*: *Devonshire Quarrenden*, *Irish Peach*, *Kerry Pippin*, *Margaret*, *Downton Pippin*, *Franklin's Golden Pippin*, *Ribston Pippin*, *Adam's Pearmain*, *Bess Pool*, *Cockle Pippin*, *Sturmer Pippin*, *Scarlet Nonpareil*. *Kitchen*: *Kewick Codlin*, *Lord Suffield*, *Nonpareil*, *Manx Codlin*, *Emperor Alexander*, *Hawthornden*, *Tower of Giammis*, *Aldrich*, *Bedfordshire Foundling*, *Blenheim Pippin*, *Dumelow's Seedling*, *Mère de Ménage*, and *Northern Greening*. *Pears*: *Doyenne d'Été*, *Citron des Carmes*, *Jargonelle*, *Williams's Bon Chrétien*, *Bourré d'Amante*, *Louise Bonne of Jersey*, *Comte de Lamy*, *Jersey Gratioli*, *Red Doyenné*, *Thompson's*, *Marie Louise*, *Bourré Dial*, *Knight's Monarch*, *Dr. Trouessart*, and *Bergamotte Espere*. *Plums*: *July Green Gage*, *De Montfort*, *Green Gage*, *Gullin's Golden*, *Transparent Gage*, *Hulling's Superb*, *Kike's*, *Coe's Golden Drop*. *Culinary Plums*: *Early Rivers*, *Gisborne's*, *Orleans*, *Victoria*, *Prince Englebert*, and *Damon*. *Cherries*: *Early Jaboulay*, *Warder's Early Black*, *Black Tartarian*, *May Duke*, *Cleveland Bigarreau*, *Elton*, *Mary*, *Late Duke*, and *Coe's Late Carnation*. *Custinary*: *Kentish*, *Belle de Magnifique*, and *Morello*.

**POTATOES (Subscriber).**—Your Potatoes will probably be none the worse for the soaking they have received. Allow them to remain in the ground to mature.

**WINTER LETTUCE (St. Edmund).**—The Lettuce you mean is the Bath Cos.

**TANK FOR BOTTOM HEAT (E. K.).**—Our "Heating Manual" gives full instructions for the formation of tanks for affording bottom heat. We could not give you any definite information, as you do not enlighten us as to what you wish, and yet we may hint that without a house or pit in which to place the tank for bottom heat you can do nothing, nor can we in ignorance thereof advise. Glad, indeed, shall we be to criticise any plan you may propose. A good book for an amateur upon outdoor gardening is the "Garden Manual," published at our office, and it may be had if you send 1s. 8d. with your address, and Keane's "Indoor Gardening" for 1s. 7½d. The "Heating Manual" may be had free by post for 5½d.

**NAME OF FRUIT (Rev. C. Madden).**—We believe your Cherry to be Early Purple Gage.

**NAMES OF PLANTS (Jeanie).**—1, *Cynodorus cristatus*; 2, *Agrostis vulgaris*; 3, *Holcus mollis*; 4, *Alopecurus aegrotus*; 5, *Holcus lanatus*; 6, *Alopecurus pratensis*. (Suberthor).—1, *Pennisetum longistylum*; 2, *Stipa pennata*; 3, *Spiraea Rosmarinifolia*; 4, *Spiraea filipendula* f. *plena*. (H. E.).—*Briar maxima*. (S. E. T.).—We have examined the plant, and it is really *Saxifraga aizoides*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### PREVENTING HENS SITTING.

As everyone who keeps poultry has not several runs, I write for the benefit of those who like myself keep a few hens in their yard. The quickest way to make them give up sitting is to put them in some place done round with wire netting with no dark corners anywhere, and far enough from their usual haunts to be strange to them. You may keep a hen for weeks shut up if it is where it is in the habit of being, but in a fresh scene I usually find three or four days quite long enough, and my hens are Dorkings. In short, anything that "changes the current of the hen's ideas," is the greatest point to aim at; therefore the more public the place the hen is put in the better.

### DARI OR INDIAN MILLET.

In answer to the query of "H. G. W." contained in the *Journal of Horticulture* as to where dari can be procured, I can inform him that a quantity has arrived at the port of Gloucester, and can easily be obtained about this neighbourhood. Mr. Phelps, corn merchant, Rose, Herefordshire, can supply it. I believe it is largely grown in the West Indies and Egypt.—H. W.

Ms. E. BIRCH says, "I have had dari from Mr. T. Day, 186, High Holborn, at 21s. the sack of 240 lbs."

### DRIFHLINGTON AND ADWALTON POULTRY SHOW.

THE twenty-first annual Show of the above-named Society was held at Drighlington on the 10th inst. The pens are about the worst used by any society, being of wood with wire fronts, and entirely worn out, and so bad, in fact, that unless the exhibitor attends the Show it is not wise to send the birds; we would advise them to be discarded for those of Turner's or some others of more modern kind, and this we put so pointedly on account of hearing complaints on this head so loud and frequent, and in the interest of the Society itself.

In poultry Mr. Beldon won most of the prizes—and had that gentleman's exhibits not been there the Show would not have been worth a visit in this section—the quality of the winners throughout being good. In *Games* were some very good birds, Messrs. Mason's Duckwing cock was superb in colour, the Piles also being good. In cock and hen of any breed a capital Silver Poland was first, and Gold second; and in cocks first was a Gold Poland, and second Black Red Game. In *Game Bantams* Black Reds won, and Black Rose-comb in the Variety class. *Geese* were a poor lot, while *Rouen Ducks* were very good. In the Variety class for Ducks first were White Call and second Black East Indian. In *Pigeons*, both Carriers and Pouters were pretty good. In Tumblers, any other variety, first were Black Mottles and second Wholesome, red. *Barbs* were good, Blacks winning; and Antwerps a fair lot, the first Blue and second Red-chequers. In Turbits, first were about the best pair of birds in the Show, Reds of the peak-headed variety, the second Silvers. Fantails good, but Jacobins poor, and Owls neat; White Africans were first, and a capital pair of Blue English second. In the Variety class first were a nice pair of Spangled Ives, and second White Dragons, Blue Dragons being highly commended. Of *Rabbits* there were nine entries, three of Himalayan only poor, and in the Variety class first was a Silver-Gray buck, and second also young Silver-Grays.

**SPANISH.**—1 and 2, H. Beldon, Bingley.  
**DORKINGS.**—1, H. Beldon.  
**COCHIN-CHINA.**—1, H. Beldon. 2, W. Mitchell, Birkenhead.  
**BRAMA POUTER.**—1 and 2, W. Schofield, Birkenhead. 3, H. Beldon.

**RABBITS.**—Himalayan.—1, G. S. Burton. 2, J. J. Mason, Drighlington. Any other variety.—1, Found & Chappell. 2, G. S. Burton.

**JUDGES.**—Mr. James Dixon.

### EARLSEATON AND CHICKERLEY SHOW.

THE annual Show of this Society was held on the 10th inst. in the cricket field at Chickerley, Turner's pens being used and well arranged for the inspection of the specimens. From some irregularities which were not fully explained the Society seems to have suffered in a financial point, but the weather proved such that we think the Treasurer will feel less anxious as to the position of the Society; and with a real hardworking Committee we think it has a good prospect before it.

Poultry were not numerous, but as a rule the winners were good. In the two classes of *Games* we noticed one capital pen of Piles and one of Duckwings, but in *Brahmas* only the first-prize Dark deserves mention. *Cochins* were good as a class, the first-prize pen winning the cup for the best pen in the Show. All were Bufts. *Spanish*, only one pen was good; and *Polish*, three pens, all Golden, were a grand lot. *Hamburgers* were good; the first-prize Silver-spangle and Gold-pencil cocks were very good, the second in Pencils being a good pen of chickens (Silvers). *Game Bantams* were two good classes, and in Reds the first took the extra prize also. The following class were all Piles, chickens taking the prizes. Any other Bantams were Silver Sebrights. In single cocks first was a Buff Cochin, and second a Brown Red Game. In Any other variety first were a fair pen of Black Hamburgs, and second Dark Grey Dorkings. *Ducks* were a very good class; and the prizes having been withheld in one class an extra was awarded, the first being *Kasarkas*, and the others *Rouen*.

*Pigeons* were more numerous than poultry. Carriers, Duns were first and Blacks second; and in Pouters Blues and Whites won respectively. *Barbs*, only one pen of Duns, the hen being first-rate. Tumblers good, a pair of Yellow Agates winning first and also the cup for best pen in the Show, second being Almonds. Owls were poor, and in Fantails the prizes were withheld. Antwerps were a grand class, the first short-headed Silver Duns; second also and an extra third awarded to a handsome pair of young medium-faced not half through the moult, and one to a third pair of Short-faced Silvers. Any other variety was a good class, the first Trumpeters, second Pigmy Pouters; while Dragons, Starlings, and Jacobins were highly commended.

*Rabbits* were the best section in the Show. In Lops the first was a very pretty young Fawn doe, 21 by 44; this Rabbit also securing the cup. Second, also a doe of that colour, was 21½ by 44, but not equal in other points; a third going to a Tortoiseshell 22 by 4, not a nice Rabbit, however. Very highly commended, a young Tortoiseshell 21 by 44, but not in good bloom. Silver-Grays were an almost uniform class, every Rabbit being good, a slight difference in the silvery only making the difference. In the Variety class the first was a real good Himalayan doe, second a large Angora of fair average coat; an extra second going to a very small Angora with a coat of very fine texture, many others being noticed.

**GAME.**—Black or Brown Red.—1, A. Sugden. Any other variety.—1, W. G. and W. J. Mason. 2, E. Holland.

**BRAMA.**—1, W. Harvey. 2, H. Digby. 3, W. Schofield.

**ANY VARIETY.**—Cock.—1, J. S. Wilson. 2, G. Fearney. 3, J. Mann.

**ANY VARIETY.**—1, D. Miles. 2, W. Harvey.

For years we and many other extensive bee-keepers have bought in September the bees of condemned hives at about 1s. per lb., or say 8s. or 4s. per swarm. Mr. Thomas Addey of Epworth told me that he had sold and sent off three hundred swarms of condemned bees one autumn. These were bought with a view to strengthen with numbers existing stocks. Swarms of bees even under the sentence of condemnation in the month of September are marketable and of greater value than most apiarists imagine.

The state of the weather on the eve of the dog days, as well as the present conditions of hives, indicate that "attention to feeding" should be the watchword of apirians during the next six weeks. If the weather do not soon improve much feeding will be necessary to fill hives with combs and brood and furnish them with sufficient food.—A. PATTENAW.

### HOW TO DEAL WITH SUPERS.

At this time of the year there are ever recurring questions as to what is to be done with supers. "How are we to get rid of the bees?" "What shall we do with the brood?" And so on. Let me state my own practice under such varying circumstances as occur to me.

First of all, there need be no difficulty where the super is well filled and there is no brood in it. I have never yet found Aston's bee trap fail. The only care requisite in the use of it is to see that the little talc valves set properly, dropping down easily in their separate chambers, so as to close the aperture at once upon the exit of each bee. An ill-constructed trap would be worse than useless. Mine is affixed to a shallow box, which is absolutely closed up save where a long narrow aperture conducts the bees into it from the super, and there is an oblong opening in the side of the box just under the aperture alluded to which corresponds to the trap that is affixed to it outside. When once I have put my super over this box I trouble no more about it, sure that in the course of an hour (more or less) I shall find it empty—that is to say, provided the queen be not there and the super is empty of brood. I prefer to put it as near to the parent hive as I can, in order that the younger bees in it may be attracted home by the joyful hum of their returning companions. I may add that it is better to remove supers late in the day when there is less chance of annoyance by stray foragers from other hives.

A friend of mine who dispenses with bee traps simply removes his supers towards sunset, turns them up under a bush, and says he never experiences trouble from robber or returning bees. He gives the super a knock or shake or two before he deposits it on the ground to give the bees notice of the change in their circumstances. This excites them to inquire for their queen-mother, and hastens their departure if she is not to be found.

Where the super is large and very full of bees, also whenever it has been ascertained that the queen is among them, or brood in any quantity, it is good policy to drive out the mass of inmates before placing the super over the trap. As soon as driven they should be put back over the parent hive. By this treatment you will have far less trouble in the end, and a multitude of young bees will be saved which otherwise would perish from their ignorance of the locality, not to speak of their inability to fly. This done, we would treat the super as before till the rest of the bees had flown home. Should any remain a little fumigation may be had recourse to with benzinone or chloroform to get rid of them.

The last difficulty concerns the treatment of the brood. If in any quantity this is always worth preserving. It should be put out as soon as possible and be carefully adjusted in some super reversed, care being taken that a hole in the super shall correspond with the hole at the top of the hive to which it is to be given. When put over the hive the bees will quickly come up and take care of it. A loose board must be put over it for the time—that is to say, until the super is to be removed in the autumn after the young bees have been duly hatched-out.—B. & W.

### TWO QUEENS IN ONE HIVE.

In the autumn of last year I forwarded to you an account of a hive of Ligurian bees belonging to Mr. John Boulton, a tradesman of Ulverston, North Lancashire, in which two young fertile queens were found working together. Eventually, when the hive had seemingly attained its original strength, one of the queens was either killed or left the hive; at all events she disappeared, and nothing more was seen of her. It may interest your readers to know that the hive has been since doing as well as could be expected in a bad season, and that on Sunday, July 5th, it threw a fine swarm.—BETA.

### OUR LETTER BOX.

**OTATHEAL (F.).**—Yes, it should be as you state, "nearly as fine as flour." **BEES NOT SWARMING (Rev. J. Brown).**—As it is too late for swarming this year we advise you to take off the large super, which you may seem nearly full, and to cut out of it any homecomb that is fully sealed, and then to replace it; or you may substitute another smaller super as the honey season is drawing to its close. If you are near heather of course you have still a possible harvest additional, which we of the low country know nothing of. The dead bees were probably drones.

**LIQUIRIAN BEES (Rev. F. E. Hutchinson).**—Send us a specimen of the bee and we will let you know if it is true.

**CANARIES AND POULTRY (E. Siddell).**—Reply to question 1. We would not recommend you to breed in-and-in as a rule, but to introduce fresh blood

each time you match your birds for breeding. For male-breeding purposes in-and-in breeding is sometimes practised. Although birds of very close relationship are sometimes paired and bred together without any perceptible detriment to the offspring, still it is natural to suppose that blood, form, and size must eventually become degenerated in each successive generation. 2. The various breeds of Canaries, with their characteristic points, may be found in a work partly re-written by Mr. Barnard—viz., "Bechstein's Chamber and Song Birds," published by Hardwicke, Piccadilly, London, price 6s. 6d., which work would "enable a beginner to identify" the respective breeds. We believe the book is the first published wherein the points by which Canaries and Males are judged are set forth. 3. We should advise you to dispose of the "forty head of poultry of mixed breeds" in the nearest market, or strike a bargain with some respectable poultryer, through each of which sources you may obtain a marketable value for the same. With the bare knowledge that "there is Game and Houdan blood among them," and that "about two dozen head are chickens of this year," it is impossible without seeing them to name the value of the lot. Chickens are chickens it is true, but some chickens differ much from others. Had the fowls been of pure and distinct breeds you would have had an opportunity of realising a better price for them than you may otherwise do. Through the medium of an advertisement, describing the fowls and giving your address, in all probability you may obtain an offer for the same.

### REMARKS.

14th.—Rain all day, very heavy after 9 P.M.; the heaviest fall since July 20th, 1867.

15th.—Another wet day and night, but not such heavy rain as on the previous night.

16th.—Raining at times nearly all day, sometimes heavily, but faster towards night.

17th.—Wet morning, and till about 4 P.M., then fine till 10 P.M.

18th.—Fair, but rather cloudy in morning, but soon clearing off and becoming a very pleasant day, though rather close.

19th.—Morning wet; day showery, but fine at intervals; fine evening, but thick haze from 9 P.M. to 8 A.M. on the following morning.

20th.—Slight rain when the haze cleared off, but the after part of the day fine and pleasant.

Owing to the rain falling on every day, and its unusually large amount, the air was extremely damp. The maximum in sun fell from an average of 165° to 95°, but owing to the same cause nocturnal radiation was diminished, and the night minima were 5° higher than in the previous week.—G. J. SMOOK.

### COVENT GARDEN MARKET.—JULY 21.

THE last week's incessant rain has had a most ruinous effect upon the fruit, which at this time of year form our staple article of trade. Good samples of Currants, Cherries, Strawberries, and Gooseberries, having become quite scarce. It has also affected the produce from under glass, which is all suffering from want of sunshine. Potatoes are beginning to show blight. The last cargo of West India Plantains are very good, price ranging from 1s. to 2s. each.

From observations taken near London during forty-three years, the average day temperature of the week is 75.1°; and its night temperature 50.5°.

## HINTS ON ROSE-CULTURE.

We are greatly indebted to those gentlemen who visit our large Rose shows and supply us with the names of the most promising new varieties, but there are many Roses that charm the eye when exhibited in a prize-stand which prove comparatively worthless when cultivated in an ordinary flower garden.

Nothing is more fatal to the popularity of a Rose than a weak constitution, and yet some of the weakest growers produce flowers exquisitely lovely; *Mdlle. Bonnaire*, *Marquise de Mortemart*, and *Horace Vernet* are types of this class, and when transplanted from the nursery to the garden how often is it the lament of the purchaser that they become smaller by degrees but not beautifully less.

I recommend to those who are desirous of growing the charming weaklings to greater perfection the following plan to attain their object:—Select a plot of ground which has been deeply trenched and well manured a short time previously, plant it with young, clean, *Manetti* stocks, 24 feet apart each way, and on these bud the Roses as close to the root as possible, and never transplant them, for they are too weak to bear it. Out-back hard in the spring in the usual way, and the result in nine cases out of ten will, I believe, be highly satisfactory.

Strong growers are sometimes condemned as weak by those who have purchased a plant or two which does not happen to thrive. The best way to arrive at a just conclusion as to the relative vigour of different sorts is to visit a nursery where Roses are grown by the thousand, and go through them row by row and take notes: whether strong or otherwise can be seen at a glance. As this is the month for budding, it may be worth mentioning that strong plump buds will generally produce stronger plants than will weak buds. Several Roses condemned by me last year have greatly improved this—notably *Beattie Johnson* and *Madame Lacharme*; both, however, spoil quickly with either hot sun or rain.—H. DUDDERIDGE, *The Dorset Nurseries*.

## FURTHER NOTES ON PEARS.

I read with pleasure Mr. W. Taylor's interesting paper on dessert Pears. No doubt some good practical results would arise out of an election of Pears, as then the sorts generally grown would be more widely understood, and the sorts marked excellent or good from the greatest number of places would be those that might be planted with the greatest safety.

About the time that I first began to take an interest in Pears no opportunity was allowed to slip in order to gain all the information that I possibly could, either from books or by testing the fruit at different seasons where good and correctly-named collections were grown; and after planting most of the standard sorts the result of their fruiting has been very differing from the expectation raised by the information previously gained.

No. 795—Vol. XXII., New Series.

One of the most fickle varieties known to me is *Knight's Monarch*; it is described in the fruit catalogues as "hardy, melting, and excellent;" and in the new edition of the "Fruit Manual" it is said to be one of the most valuable of Pears. I have tried it in three different ways: First on the wall, where it has borne fruit for three or four seasons; each time the largest proportion of the fruit remained hard until the end of the season, when it has been necessary to throw it away. Secondly, as pot trees in the orchard house, where the fruit grew to a much larger size, and was carefully gathered at the right time, but the result was exactly the same as to the ripening of the fruit. In pots where they were removed out of doors, and the fruit ripened as a pyramid, it is quite the same. Now, it is not the soil, as the loam used for the pot trees is different from the garden soil, and the climate must have been very different in the orchard house from that out of doors, and the climatal conditions of a wall facing west is different both from the orchard house and from the open garden where the sun and wind acted upon the trees at any time. This year a large portion of the fruit dropped off from the wall trees before it was ripe, and I noticed in the answers-to-correspondents columns that others were in the same predicament, and also that their fruit failed to ripen satisfactorily. If anyone has ripened this Pear well during the last few years, information as to how the fruit was grown and the nature of the soil would be very valuable.

I tasted fruit of it in the most splendid condition some eight or nine years ago at Hallingbury House; Mr. Spivey, the gardener, could, no doubt, let us know if the fruit ripens well every year with him. He has a splendid collection of Pears, and could give your readers most valuable aid. There is a printer's error in the "Fruit Manual," the year 1850 should be 1830.

Take another useful Pear of quite a different character—*Beurré Boss*. Dr. Hogg hints that the fruit is not of good quality unless the tree is grown against a wall; and the principal fruit catalogues seem to hold a similar opinion. We have not grown it at Loxford in such a position, but there is a large standard tree in the garden which annually bears large crops of fine fruit which ripens in October and November, and is always good. It never fails to ripen well, and the tree has not failed to produce a crop for the last twelve years.

I would name *Marie Louise* as the best and most useful of all Pears; it is excellent on walls, as a pyramid, and grown as a pot tree in the orchard house. *Beurré Superfin* and *Doyenné du Comice* are splendid Pears on a clay soil, but in our light soil they cannot be recommended. The fruit has been good once or twice, but it is always uneven in size, and generally cracks badly; but I must reserve the information about other varieties until it is decided how and at what time the information is to be sent. If the Editors can be advised to issue printed forms to the principal fruit-growers I have no doubt they will heartily respond.

I have frequently urged the importance of summer pruning upon the readers of the Journal, and am more

No. 1262—Vol. LIV., Old Series.

than ever convinced of its importance, especially in the case of overluxuriant trees. It is not desirable to allow the shoots to grow until the trees are a thicket of young wood, and then to begin and thin the growths out all at once. I have done this when trees had been neglected rather than allow the growths to remain until winter, and the crop has not in the least suffered; that is apparently, because it is not reasonable to suppose that the check the tree would receive by having so much young wood removed at one time would not set unfavourably in some way or other.

If continuous crops of excellent specimens are to be produced it will not do to neglect the trees. In shallow soils they often suffer for want of water at a time when moisture at the roots is most required. A good plan is to mulch round the roots with short manure; this not only retains the soil's moisture, but, if it is necessary to water, evaporation is arrested. It is also a good plan to syringe the trees daily during the hottest of the summer weather; this is a great aid to the swelling of the fruit, and is even more necessary when the trees are grown upon a wall.—J. DOUGLAS.

### AN INQUIRY ABOUT FOREIGN PINES.

ALLUSION having been made by Mr. Douglas to the good quality of the Pines now imported from St. Michaels or elsewhere, and which to a great extent have supplied Covent Garden for the last year or two, and which seem by their good appearance to be likely to have an important influence on the trade of those who grow such fruit for market in this country, and possibly may also induce some who grow this valuable fruit for private use to give up doing so. In fact, I am much mistaken if their growth be not already partially abandoned. It would be well to ask the question, In what way are these fine-looking Pines grown, and what are their merits at table as compared with home-grown fruit of fair quality? This latter question is not the least important one, for although we know the Pine is very often placed on the table to look at, its merits when cut are invariably criticised. It is only fair, therefore, that a comparison between imported and home-grown fruit be made known. Doubtless the former is not so good as it would be if allowed to fully ripen before being cut, as it must of necessity be separated from the plant say a fortnight or more before it is quite ripe; but taking into account the brighter sun and more agreeable climate it enjoys during its growth to what it does in our confined hothouses, I expect it can afford to give a certain number of days that may be fully said to be blank in its ripening period, and still equal, if not excel, ours. How far this is the case remains for those to decide who have the opportunity of tasting several fruits of both kinds. One thing certainly must be said in favour of the foreign production—they are exceedingly well managed, and they differ widely from those we were in the habit of seeing years ago; in fact, the sudden change is such as to puzzle us to know how quickly they had arrived at such good cultivation in the quarters they are now grown at. Moreover, one or two of our choicest home varieties are amongst them, that the question arises, Did they take the stock from here? Certainly we never heard of Pines being grown there before the last two or three years, and now they seem to be produced in abundance.

Coming now to another feature of the inquiry, which is Under what circumstances are they grown—in the open air or under shelter of some kind, and in what way? I confess being not a little curious this way, for Pines have been a favourite fruit with me, and to see them growing in an open field and throwing-up their fruits like heads of Rhubarb running to seed must be a rare sight to those who have not seen such things. Moreover, when we bear in mind the small-sized fruits we used to be accustomed to see arrive each summer from the West Indian islands, and knowing the tropical character of these islands, we were not prepared to see such an advance in quality from another island not so favoured in tropical heat by several degrees. It would be wrong to suppose that the whole thing is only a trading trick, and that only a few of the very best are sent here at a loss to those who sent them, but merely to serve some other end, as, I believe, the first Australian preserved meats were sent here at a loss to obtain the custom. But these Pines are too numerous for that. Neither do I for one moment expect that any dodge is practised or attempted, but that an exceedingly good mode of managing them has been discovered and acted upon; hence the result.

The question then is, How are they managed, or rather grown? What does the climate resemble, and what the soil? A great many years ago the Pine-growing world was startled by being told that somebody in France produced very fine Pines grown in pure peat, and for a time peat was all the rage in England; but that hobby quieted down, and a soil of a contrary kind is more generally used. But what do our gardening friends at St. Michaels or elsewhere grow their Pines in, and how do they treat them? I can hardly expect that rudely planting a few suckers in ground scarcely disturbed by cultivation and leaving all the rest to Nature will produce these fine Pines, although it will, no doubt, insure small fruit; and whether they grow them in the full sun, and where that luminary has the unchecked privilege of heating and baking the earth to the utmost limits that roots descend, or whether irrigation is practised and when? How or when are all the forces of artificial cultivation put in operation, or to what extent these helps are made to assist Dame Nature in producing what we so much admire? Furthermore, Are any means used to ward off the plague of mealy bug and white scale we have so often to wage war with in hothouses?

I confess not having had many opportunities of witnessing foreign fruit from St. Michaels, but what I have seen seem exempt from these pests, which West Indian Pines were not. In fact, if someone would give us a chapter on the growth and management of the Pines of which such good examples have been sent from abroad to Covent Garden Market and elsewhere, they will confer an interesting benefit on home growers. Moreover, they need not be afraid of any trade competition by our following their practice here, for the many degrees of latitude as well as other conditions preclude such a thing; but it will be at least satisfactory to learn how much of the credit of the fine fruit is due to the cultivator and how much to climate. As it is, we can only guess the proportion accorded to each; but it may be complimentary to the grower to say, that in the absence of other information we are inclined to give him a larger share of the credit of producing such fine fruit than is accorded to that of any other grower of tropical produce, whose only claim to attention is too often that they do not hinder Nature in her works, but to assist her to any extent, a dislike to labour were to form their only exertion.

It would be well for those contemplating large and extensive Grape houses in this country, to look round and ascertain if there is not some nook or corner in this world within a few days' steam of England, where Grapes equalling or excelling the best home-grown are not likely to be furnished at some day not far distant in the abundance and good quality as the Pines are which we have been so recently treated with. That such a thing is possible no one who has witnessed what has been done of late years will deny; and when we take into consideration the popularity, not to say the absolute use of the Grape in many cases of illness, we need not be surprised if someone bent on discovery should not make the attempt; with what success time alone will determine. If I were disposed to make a bet it would be that such a spot would be found out yet before the North Pole.—J. ROSSON.

### SEVILLE LONG-POD BEAN.

I was glad to see from "W.'s" interesting notes of the Royal Horticultural Society's Chiswick Garden that this Bean maintained the high character formed of it in preceding trials. "W.," and no doubt many of your correspondents, will be interested by an account of its doings in other than its first trial grounds. I hail from nearly three hundred miles further north, and 500 feet above sea level. I confess to entering it in the list with Early Long-pod with no little forestalling of the result. This it may be considered an unsatisfactory way to treat a new aspirant, and not likely to lead to a just estimate of the merit, as compared with older varieties, of novelties. The condition of culture, soil, and site being the same, certain evidences of merit will in the end manifest themselves in the kinds subjected to trial. Facts will result, and these are such stubborn things that prejudices conceived in favour of the old or new must succumb to them.

I will briefly state the facts deduced from a trial of the Seville and Early Long-pod. They were both sown on the 19th of March; the Seville had beans of a size fit to gather on the 10th of July, and the Early Long-pod on the 15th of the same month. The number of pods upon a plant of Seville twelve, and the number of those upon a plant of Early Long-pod fifteen. These numbers are a fair average of the pods

borne by plants of each kind. The length of the pods when the beans were of the size named were of Seville 9 to 10 inches, and of Early Long-pod 7 to 8 inches. The greatest number of beans in the pods of Seville and of Early Long-pod were six, and the main of the pods of both contained four beans. The colour of the beans in Seville is green, not quite so deep as in Green Windsor, whilst the colour of the beans of Early Long-pod is greenish white, and the usual mud colour when cooked. The height of the haulm in Seville is 8 feet, and the plant is of procumbent habit, which does not give a greater height to the plants as they stand than 2 feet. Early Long-pod has the haulm erect, and 4 feet high; stiff and strong. The beans in Seville are about twice the size of Early Long-pod, and the pods are much larger; the pods are, in fact, "whoppers."

I am informed of a pod of Seville grown in a neighbouring garden measuring 18 inches in length with the beans of full size. Conclusions are inevitable. Mine are that the Seville Broad Bean—from its earliness, size, and colour—merits the first place in the list of the Long-pod section.—G. ASBURY.

### AND YET MORE ABOUT ROSES.

I wonder whether Mr. Radclyffe has ever heard of the very expressive Irish word "blarney," and if he has, as no doubt he has, whether it has ever entered into his mind to think that the gentleman who told his housekeeper that the Roses at the Crystal Palace Rose Show were a joke to those at Okeford Fitzpaine was guilty of that hibernianism, and had been working on the imagination of his faithful dependant. Perhaps the gentleman himself had a little Irish blood in his veins, and liked to lay the gentle flattery on thick while he was about it. Really, if these said Roses are so fine, it is a pity that Mr. Radclyffe does not charter a special train. More than fifteen thousand people went to see the Roses at the Crystal Palace, and all who were not ticketholders had to pay 2s. 6d. each; and if it could only be made known to the British public that the feast of Roses there provided by Messrs. Paul, Turner, Keynes, Cranston, Prince, and Co., to say nothing of the twenty to thirty best amateurs in the country, was a mere nothing—only a joke—to what might be seen at Okeford Fitzpaine, why surely the said British public would only need the hint of a special train to come and admire those wonderful Roses to their heart's content.

Well, after all Mr. Radclyffe is right. Taste in Roses is a mere matter of opinion, and perhaps the gentleman who had been to the Crystal Palace Show did not admire long rows and large boxes of Roses in single blooms, and preferred to see them growing at their sweet will. Mr. Radclyffe's faith in nurserymen's catalogues and descriptions of Roses must be very great if it has not received a severe check ere this. How else will he account for the numbers of Roses that have come to us even from the best of raisers, ticketed large, superb, fine shape, splendid colour, free grower, glowing crimson, or deep maroon, &c., and which are now utterly unknown to fame? Has not even Mr. Radclyffe in years gone by recommended in glowing terms Roses that he would hardly admit into his garden now? I say this, however, with a certain degree of trepidation, as Mr. Radclyffe is like an old soldier—he sticks by his colours, and does not like to give up an old favourite. Well, whatever Mr. Paul's opinion may be of Abbé Bramerei as established among old favourites, all I can say is I never saw a bloom that was not rough and coarse—coarse not from size, but from unevenness of petal and raggedness of outline. A box of twelve was staged at the Crystal Palace at the last Rose Show to compete among twelve of new Roses, and we fairly presume that whoever exhibited them considered them good specimens of their kind, but there was not one good bloom among them. Of *Maxime de la Rocheterie* I cannot speak so confidently; but I know whenever I have seen it either growing or exhibited, and the latter has been very rarely, I have always put a cross against it as not worth growing. Of *Baron Chaurand* I am not much of a judge, as I have never yet seen a good bloom of it and do not grow it myself; but all I can say is that those blooms which I have seen have not left a favourable impression; it seemed to me dull in colour and deficient in size and quality.

Now let me venture to say that size has not necessarily anything to do with coarseness. No one ever saw *Alfred Colomb*, or *Marie Baumann*, or *Dupuy Jamain* coarse from being too large. On the contrary, the better a Rose is intrinsically, the better, that is to say, in form, in substance, in freshness of colour, in smoothness and evenness of individual petal, &c.,

the larger and finer it is grown the more these inherently good qualities come out. I may not have made my meaning very clear, but what I would wish your readers to understand is that, as a general rule, a large *Alfred Colomb* is better than a small one, a large *John Hopper* than a small one, a large *Madame Vidot* or a large *Marie Baumann* than a small one. But there are Roses not intrinsically good of themselves which are not improved by size—a large *Paul Neron* is worse than a small one, a large *Edouard Morren* or a large *Madame Masson* than a small one. I enter upon this at some length, for I have known a really fine stand of Roses discarded for a set of small compact blooms, when the latter would never have been equal in quality to the former when expanded. The smaller, as a rule, the bloom of a good Rose the less is the middle of the Rose filled up with petals. This to many of your readers who are accustomed to judge Roses may be a mere truism; but there are some of our very best Roses which, when small and badly grown, are only semi-double, and show a yellow eye when they begin to expand.

I cannot at all agree again with Mr. Radclyffe as to the value of very dark Roses. I should not care to multiply *Jean Cherpin*, *Pierre Notting*, *Prince Camille de Rohan*, *M. Boncenne* about my garden. A few really good dark Roses such as those named are very useful, but the most valuable colours are those of the type of *Alfred Colomb*, *Madame Victor Verdier*, *Duke of Wellington*, and *John Hopper*. Some of our pink Roses are unfortunately too thin in the petal, and do not stand a wet weather, as *M. Noman*, *Centifolia rosea*, and others. But, then, on the other hand, dark Roses, like *Empereur de Maroc*, *M. Boncenne*, and even that beautiful-coloured *Rose Xavier Olibo*, burn in hot sunny weather, and will not even stand a day's sun.

I agree with Mr. Radclyffe in his estimate of the value of *Madame Vidot* and *Cécile de Chabillant* as model Roses, but do not think the others are at all equal in form to *Marie Baumann*, *Alfred Colomb*, *Marie Rady*, or *Charles Lefebvre*.

As to button-hole Roses, I do not see how Roses such as *Mme. La Baronne de Rothschild*, *Charles Lefebvre*, *Eugénie Verdier*, *Madame C. Joigneaux*, even in the bud form, can be considered as button-hole Roses, as in a very short time they would expand when worn. *Safrano*, mentioned by another correspondent, is undoubtedly good, and so are *Narcisse*, *La Boule d'Or*, and small flowers of *Cécile Forestier*, but I think this has been named before.

Let me add a few more words with regard to the matter of coarseness. What, it seems to me, we want to eliminate from large Roses is unevenness, irregularity of petal, roughness of outline, imperfection of shape and quartering. Some Roses are seldom clear of these faults; some, again, are beautiful in their semi-expanded state, but show too much centre when they open fully, as *Louisa Wood* or *Madame C. Joigneaux*; but we must be careful lest in trying to eradicate these faults we revert to Roses that are too hard and full in the bud to open well, or in trying to get rid of roughness have petals too thin and flimsy, which will not stand either sun or wet.—C. P. P.

### MANURE AS A SURFACE DRESSING.

THE application of manure as a surface dressing to almost all kinds of crops has long been acknowledged as beneficial, and its good effect upon certain plants has occasionally been set forth in this Journal. So far as I am aware, however, no attempt has been made to show why it is worthy of general attention, to explain its action, or in other words prove that it is of even greater assistance to many crops than if it were mixed with the soil and buried after the usual fashion. In doing this I will state at the outset that it is only during the last two or three years that I have given particular attention to this matter, and it may not prove uninteresting if I state my reasons for doing so.

Some two or three years ago the Rev. C. P. Peach took exception to some notes contributed by me on Strawberry culture, in which it was advised to dig-in manure among the plants immediately after the crop was gathered, on the ground that surface dressing was decidedly preferable. Now, although I considered and maintained at the time such adverse criticism to be faulty, not in spirit but in matter, yet it afterwards repeatedly occurred to me that assertions from one whom I have the strongest reasons for regarding as a decidedly safe authority in matters horticultural ought not lightly to be passed over. Further consideration led to a determination to repeat former trials, and to thoroughly sift a matter so simple and

yet so important. With regard to the Strawberries I am free to own that the trials have proved Mr. Peach to be right as regards the surface dressing, the fruit of several kinds which are now being picked from beds so treated being both abundant and fine; and in making this confession I beg to offer my best acknowledgments to Mr. Peach, not only for the saving of labour which the plan enables me to effect, but for directing attention to a matter of such great importance to other crops as well as Strawberries.

Let us now proceed to consider why the surface dressing is so desirable. It is a fact familiar to all that all parts of the roots, especially the spongioles, shun the light and air. Now, it is to the spongioles, the plant's mouths, to which we wish to convey nutriment as directly as possible; and yet they are often so far beneath the surface that we cannot readily reach them, for if we attempt doing so by a temporary removal of the soil other rootlets are inevitably destroyed in the process. Another most important reason for wishing to have the roots near the surface is, that it is there that the best soil is found, and we know that if we can only induce the roots to come up into it we shall impart additional health, vigour, and fruitfulness, which it is, of course, highly desirable to secure by any means, but especially by an agency of the simplest and best kind; and when the roots are once established at the surface we have only to attend to their requirements to keep them there.

For most fruits an annual surface dressing, applied generally in the fall of the year, is all that is necessary, but if an additional stimulant is required sewage may be applied with the certainty of its being immediately beneficial. Who does not know the inutilty of pouring sewage upon the surface of a deep Vine border lying bare and exposed to the hardening influence of sun and wind? It is true that the roots may be reached by the barbarous method of piercing holes with a crowbar, but even then the Vines cannot derive a tithe of the benefit which attends surface-feeding. The action of the nutriment cannot be so immediate, nor the flow of sap so prompt.

As examples of its effects in actual practice I may instance three vineries in all of which the Vines were in a somewhat weakly condition owing to the poverty of the soil. As a remedy, the borders of two of them received a dressing of loam, crushed bones, and stable manure; but the third border instead of this mixture had a liberal surface dressing of rich pig dung. The result in the following season was striking and conclusive, the Vines in the third house being wonderfully superior in berry, bunch, and foliage to those in the other two houses. Take for another example two beds of Gooseberry bushes: the first was planted in soil suitably enriched with manure, and an annual dressing was afterwards forked-in among the roots each autumn after the fall of the leaf; the second was planted in a similar manner but two years later, the soil was never afterwards disturbed but received an annual surface dressing of manure. In two years the bushes were as large as those in the first bed, and the crop of fruit was decidedly the best. Other examples might be quoted of trials with Raspberries, Currants, Roses, and many other plants if it were necessary to do so. Its good effect upon summer vegetables was explained long ago; in fact, it is not to advocate a novelty or to propound a theory of my own that these notes are written, but rather to draw particular attention to a point of culture which from its very simplicity is not practised so much as it so richly merits.

In concluding, I cannot do better than revert to the principle which it is written to enforce—that both plants and fruit trees answer best when the roots are kept near the surface, and that this is done most advantageously by a surface dressing of manure, which serves to draw the roots upwards as well as to nourish them. It by no means follows, however, that surface roots are only to be obtained by the application of rich manure; a covering of any kind of litter will effect this. A knowledge of this fact has been turned to account in the management of an orchard containing some four or five hundred young fruit trees, the roots of which are kept near the surface by taking the weeds and leaves which accumulate upon the surface and putting them upon the soil around the base of each tree. A saving of labour is thus effected, the orchard is kept tolerably neat, and the trees are undoubtedly much benefited.—EDWARD LUCKHURST.

**MUSHROOMS.**—Two Mushrooms (*Agaricus gambous*) were gathered in my field last night, of which I send the dimensions,

as they seem to me out of the common way. Circumference, 28 inches; diameter, 9 inches; girth of stem,  $3\frac{1}{2}$ ; weight, 1 lb.  $3\frac{1}{2}$  ozs. The second is rather smaller, but thicker, and weighs about 1 lb. Both are excellent edible Fungi. No doubt this is an extraordinary year for Mushrooms, but are not these of a rather exceptional size?—A. R., Bromley.

[The year has been prolific of all species of Fungi. Even in the north of England the markets were supplied largely with the common Mushroom as early as the first week in July.—Eds.]

### HOME-MADE FLOWER POTS.

GLASS pots, and slate pots, and clay pots, clean pots, and dirty pots—even teapots—have lately been mentioned as adaptable to plant culture. Possibly all are good for certain purposes and under certain circumstances, and so also are the home-made pots which we now notice. The pots we have in hand oppose the notions of those who consider a clean pot essential on the one hand, and a densely made or glazed pot advantageous on the other. The home-made pots are emphatically dirty pots and pre-eminently porous pots, and, what is more, both these qualities are virtues—yes, are the very essentials of the pots. These pots are noticed, not because they are novel or fanciful, but because they are cheap and useful—qualities which must command attention where small pots are employed by hundreds of thousands for the preparation of bedding plants.

The most complete mode of making these pots which we have yet seen is that which is adopted by Mr. McIntyre, the Superintendent at the Victoria Park. The models which were recently exhibited we have had engraved, and thus we place before our readers in an intelligible manner this simple and

FIG. 1.

FIG. 3.

FIG. 4.

FIG. 2.

Fig. 11.—Models for Home-made Flower Pots.

useful mode of pot-making. Fig 1 is the model, which is made of tin. It is  $2\frac{1}{2}$  inches in width at the top and  $1\frac{1}{2}$  inch at the bottom, inside measure, and about  $2\frac{1}{2}$  inches in depth. Fig. 2 is the pot when made. Fig. 3 is the bolt, which is about 5 inches in length of half-inch round iron, to which is soldered a shield of stout tin an inch in diameter; this shield is an inch from the end of the bolt. Fig. 4 is the mould (inverted), which is made of wood, the upper part to form the handle, the lower part being the mould or plug; the size of the plug is  $1\frac{1}{2}$  inch across the top and an inch across the bottom, and  $2\frac{1}{2}$  inches deep. These it will be seen are all easily made.

Now to their use, but first as to the material. This is a composition of strong loam—not clay—a little leaf mould and cow dung. The loam and leaf mould may be in the same proportions as if required for a potting mixture for the plants, and the cow dung may form about one-tenth of the bulk. This when well mixed and tempered, using water as required, is

ready for use. We are now at the potting bench. Bore a hole through the bench, and put the bolt No. 3 into the model No. 1, and the shank of No. 3 into the hole in the bench; put into the model a lump of the composition, pressing the plug No. 4 into it, and by holding this with one hand, and turning the model with the other, the shape of the pot is obtained. By pressing the bolt upwards the shield pushes the pot No. 2 out of the mould in a perfect state.

With a little practice a man and two boys will make a great number of pots in a day. The pots when finished are about a quarter of an inch in thickness. When dried they can be stored the same as are fire-burnt pots, so that their manufacture can be entered on at any convenient time, and is profitable work in inclement weather. The size given is for Lobelias, Alternantheras, Verbenas, and other spring-struck plants which do not long occupy the pots, but of course size can be determined according to the nature of the plants. They are dried in the open air, and in fine weather are ready for use shortly after being made.

Previous to bedding-out the plants are watered and the pots are planted in the ground—that is, the plants are not turned out. The porous pot absorbs the moisture and becomes soft, and the roots grow through the sides into the surrounding soil. Even when the pots are standing closely together in a frame and are kept moist the roots protrude through the sides. Plants prepared in these pots are found to flourish in all respects as well as do those in the ordinary fire-burnt flower pots.

It is premature to note the flower gardening at Victoria Park, as the plants are washed out of character by the drenching rains, but there are beautiful combinations which require sunny weather to perfect them, and which will then rank amongst the finest examples of modern bedding.

### IN AND OUT OF LEICESTER.

A CROAKING old Leicestershire farmer has recited to me the old quatrain—

"When the sand doth feed the clay,  
Then for England well-a-day;  
But when the clay doth feed the sand,  
Then it is well with England."

That farmer's land is heavy and rich, on which in the last century Beans were the staple crop. So extensively were they cultivated that the county was locally known as "Bean-belly Leicestershire." So largely were they consumed by the population that in the neighbouring counties a proverbial saying was, "If you shake a Leicestershire man you may hear the beans rattle inside of him."

Bean feasts are said to have been earliest instituted by Leicestershire farmers. They feasted their labourers at the conclusion of the Bean harvest, which being late in autumn the crop is liable to be injured by the wet weather then prevalent, so they rejoiced when all the Beans were in safety. The notoriety of the county for Bean culture is of many centuries' existence. It has given a name to places and even townships. Bean Hills is a manor; and of Barton-in-the-Beans, Mr. Burton, the earliest topographer of Leicestershire, says "It is so called of the great store and increase of that grain in this place, yet the old shire yieldeth great abundance of Peas and Beans more than any other county, insomuch that there is a common byword of the same, commonly known to all men—namely, 'Leicestershire bean-belly!'"

I have seen an average acreage of Beans this year about Leicester, and they and Oats are the only seed crops that have not suffered by the heavy and continued rains, yet I do not arrive at the croaking farmer's anticipation that the light-land crops must be superior in produce to those on the heavy. A few windy days and a hot dry fortnight now will restore an upright position to most of the prostrated grain crops. Then, all along the eastern margin of the northern counties I can attest that in the three first weeks of July there was no excess of rain, and a letter before me tells the same of Scotland, and that much of the hay has been secured without a shower on it. Potatoes in the same localities are abundant and healthy.

Abundance of Bean blossoms may have suggested and been one of the sources which supplied the honey the Anglo-Saxon monarchs claimed from the town of Leicester, which "Domesday Book" tells was fifteen seeterces annually.

A short and pleasant walk led to the ruin of Leicester Abbey, and he must know little of England's history during the Tudor period who, as he looks upon the ruin, has not called to his

remembrance the words of the fallen Wolsey to the monks—"I am come to lay my bones among you." No man is without some good qualities, and among those of Wolsey was his encouragement of gardening. A contemporary versifier represents the Cardinal as saying—

"My gardens sweete are closed with walles strong,  
Embanked with benches to sit and take my rest,  
The knots so enknotted it cannot be expressed;  
With arbors and allies, so pleasant and so dnice,  
The pestilent airs with flavors to repulse."

In tracing Wolsey's career I have gathered many other notes illustrative of the circumstances of those days. Even his expenses are records of prices. Chickens were 2s. a dozen, pigeons 15d. for the same number, a peck of Filberts 1s., one hundred Pears the same money, a goose 7d., one hundred Walnuts 2d., three Cabbages 2d., and Grapes, herbs, Onions, salt, and sauce, quantities not specified, 2s.

I had no leisure for searching after plants Dr. Pulteney, the well-known botanist, tells of being found near the Abbey, nor to visit Mount Soar-Hill where he was born, but I have read his notes in the "Philosophical Transactions" on "The more rare plants of Leicestershire." He died on the 18th of October, 1801, and was buried at the village of Langton in Dorsetshire, but a memorial tablet in the church of Blandford, where he practised as a physician, bears the appropriate portrait of his commemorative plant, the Pultenaea, and beneath it this inscription:—"This tablet is erected in memory of Richard Pulteney, M.D., F.R.S., who, after thirty-six years residence in this town died on the 18th of October, 1801, aged seventy-one. That modesty for which he was remarkable through life forbade any eulogium on his tomb; but he will long be remembered with gratitude and affection both as a physician and as a friend; and with the truest reverence and sorrow by Elizabeth his afflicted widow, daughter of John and Elizabeth Galton, of Shapwick, Dorset." He bequeathed legacies to various institutions, his museum to the Linnean Society, but the chief part of his library was sold by auction in 1802. His MS. "Flora" is in the Leicester Museum.—G.

### ROSES.

I HAVE bloomed St. George and Souvenir de John Gould Veitch since I last wrote; they are both high-coloured and excellent. The first is nicely scented, which cannot be said of the new Roses generally. The finest-scented Rose, and the finest of all Roses lately raised, is Louis Van Houtte (Lacharme) and Baron Chaurand. The scent of these Roses is equal to the Teas; the last I think is superior in scent to most of the Teas. It does splendidly on the seedling Briar. I have grown some noble specimens of it. I shall buy twenty more of it on the seedling Briar. I do not think it does well on the Manetti. I must now thank M. Lacharme for raising these fine Roses—Charles Lefebvre, Alfred Colomb, Louis Van Houtte, and Madame Melanie Willermoz; they are all first-rate.

These also are good—Victor Verdier and Baron Adolphe de Rothschild. The next is very curious, Anguste Vaucher; the base is deep fulvous gold, and the tips of the petals pure bright copper. If he raises no more he will have done enough. I hear well of his Rose Capitaine Christy. I have bought his Rose Souvenir du Baron de Semur.

I am glad Mr. Peach suggested the affixing of the names of the raisers. I will not buy unless I see the raiser's name. Seeing Lacharme's name I bought the last Rose, and because we want more high-coloured Roses. Baron de Semur and Star and Queen of Waltham are the only novelties that I have bought this spring.—W. F. RADCLIFFE.

### CUTTINGS.

Do we not make serious mistakes about the best time for putting in cuttings? Take the case of Roses. The usual time is to put the cuttings in about October or November. I am of opinion that July is a far better time. When the plants are full of organisable matter cuttings will callus sooner, and if other circumstances are favourable roots will be more readily produced than later on when the plants are going to rest. Recently I have been trying the experiment, and though it is too early to express a positive opinion, I have seen enough to induce me to pen this note with a view to encourage others to try the experiment at once, and to report the results.

It is well known that Pansy cuttings put in as early as possible root almost to a certainty. Pippings of Pinks, &c., if put in as soon as they can be obtained are far more likely to

root rapidly and to do well than if put in later. This is a matter of much interest, and if my views are right I think it will be found that Roses on their own roots may be raised with more ease and certainty than is generally supposed.—PHILANTHES.

## ROYAL HORTICULTURAL SOCIETY'S SHOW.

JULY 21st.

ONE or two points of interest at the grand Exhibition so well described in last week's Journal deserve notice. It is not possible when an exhibition is so extensive to describe anything minutely, and I now add a few remarks on the fine show of Carnations and Picotees.

There is a National Carnation and Picotee Society located in the midland counties, but a Midland Counties Society would be a better name for it, as it cannot touch the south, as our blooms will be quite over before their Show is held. The third week in July is a safe date for London, and on that week the Royal Horticultural and Metropolitan Floral Societies offered prizes—not prizes sufficiently large to bring growers from a long distance, nor were there many classes, but Mr. Turner sent a large number of stands for exhibition, and there was some competition in all the classes. It would be a grand day for the florists when the Society offers the same amount for a stand of twenty-four distinct Carnations as it does for a collection of fruit and twelve stove and greenhouse plants. Modern gardeners would laugh at the bare idea of such a thing, but this was done thirty years or more ago, and Mr. James Hogg of Paddington obtained the gold Banksian medal for his Carnations and Picotees at one of the Chiswick exhibitions.

Some of the flowers at the recent Show were very fine, and the new varieties have proved again to be a decided advance on some of the old sorts. Beginning with Carnations. *Scarlet Bizarres*.—The new sorts, Guardsman (Turner), Mars (Hextall), and Mercury (Hextall), will hold the highest position in their classes for many years at our present rate of progress. *Crimson Bizarres*.—Isaac Wilkinson (Turner), and Marshal Ney (Headly), are the leading new flowers. In *Purple Flakes* Ajax (Hextall), is superb, and is decidedly the best in its class. *Scarlet Flakes*.—This is a showy class and already contains good flowers, but all of them are wanting in fullness; however, Mr. Battersby (Gibbons) and Superb (Ingram) are indispensable. *Rose Flakes*.—This is a charming class, and contains some of the finest Carnations in existence. Mrs. F. Burnaby (Turner), is a charming flower, very distinct in its colour; it is of the softest pale rose, large, and full. Phœbus (Headly), is also very good; it has bright rose markings.

Turn we now to the Picotees. *Red-edged* comes first. *Leonora* (Fellows), is a distinct heavy edge. Mrs. Keynes (Fellows), a very fine medium-edge with a pure white ground; and *Princess of Wales* (Fellows), is certainly by far the best heavy red-edge in existence, and a most distinct flower. In *Purple-edged* we have a splendid flower in Mrs. Little (Hooper), certainly the finest light-edge ever raised; the white is of the purest, without spot or bar. In the *Rose and Scarlet-edged* class we have some great advances. *Ethel* (Fellows), large, pure, smooth, and full; extra fine. *Juliana* (Turner), is a very fine heavy scarlet-edge, not so large as *Obadiab*, but it has a better petal. Mrs. Allcroft (Turner), this is the best light-edged flower we have—not a bar or spot to be found on its pure white ground. Mrs. Fordham (Turner), this as it bloomed with me this year is a splendid flower; it is a medium-edge, very full, and the petals like leather. The three last-named flowers are great advances and highly creditable to the raiser.

It is a great pity that Mr. Norman has given up the culture of these flowers; and Mr. Pizzy, who also held a high position, has also left the field through removing to another situation. Let us hope their places will be supplied by other ardent cultivators. Mr. B. Atkins is a new exhibitor and showed some fine flowers.

I have extended my notes on this favourite old flower longer than I intended, but have still space for a few remarks about the Floral Committee. No wonder if some mistakes are occasionally found in the reports of this body. Up till nearly three o'clock only numbers were to be found on the largest proportion of the exhibits, and about two one large exhibitor was busy removing his plants somewhere else, and amongst them some that received first-class certificates. It is necessary both for the sake of the public and the exhibitors that a correct report should be given of all new plants and flowers, but as matters are arranged at present it is almost impossible to do so. The system of placing numbers instead of the name of the exhibitor on new plants is decidedly objectionable and can answer no good purpose whatever; and no plants ought to be removed until after the general meeting at 8 P.M.

I noticed a very fine new zonal *Pelargonium* of the Bronze class that has not been exhibited before. It is certainly a great advance on any in its class. It was in the collection of Mr. John Laing, Stanstead Park, Forest Hill. It is named *The Osar*. The leaves are smooth and of great substance; they have a distinct margin of greenish yellow, next a broad band of a

bright chocolate colour and a greenish-yellow centre: it is most effective. Of a different type is Mrs. Harrison Weir, more in the way of *Impératrice Eugénie*, but a much finer variety. The leaves are smooth edged with yellow, with a distinct reddish band; centre yellow. Both these plants are great advances, but I was told the Floral Committee would not grant certificates for them. They were not entered at this meeting because of that.

I may just notice a very fine *Phlox Drummondii*, which I found out afterwards was sent by Mr. B. Dean of Basing. This was certainly also an advance on any I have yet seen of this flower. The old General Radetsky with its beautifully striped flowers was long a favourite, and this new one is a fine companion to it; but it also was passed.

When *Orochids* are exhibited, if they have any beauty at all they generally come in for high honours; but I fancy that the more humble flowers—even a *Phlox Drummondii* or even a *Forget-me-not*, if it is an advance on anything that has been previously raised, should be rewarded with a first-class mark—that is, when its merits are fully proved.—J. DOUGLAS.

## CITY OF LONDON FLOWER SHOW.

To encourage a love of flowers and to stimulate their culture in the closely-pent homes of the city it was determined some few years ago to offer prizes, and have a real flower show in the city, by the city, and for the city. It was a laudable idea, and has been well carried out. The sixth Exhibition was held in the grounds of Finsbury Circus on the 27th inst., and resulted in an interesting collection of window plants and a large amount of patronage. The Show was divided into twenty-five classes of popular window plants, as Musk, Fuchsia, Geraniums, Myrtles, Campanulas, Orange trees, Ferns, Creeping Jenny (*Lysimachia*), &c., also window boxes, and in all the classes there was considerable competition. We observed plants exhibited by little children and hale septuagenarians. Amongst the miscellaneous plants were Wheat, Oak growing from acorn, Tobacco, and a precious Orange plant, marked as growing from a pip sown two months ago, only unfortunately the owner is cherishing something else, for her pet is not an Orange. It is gratifying to find all the plants so clean, and it is clear that pains have been bestowed by the several growers, who richly deserve the liberal prizes. Special prizes were also given—viz., a silver medal by the Royal Horticultural Society for the best plant in the Show, and three bronze medals. The silver medal was taken by G. Moss with a very healthy *Indiarubber* plant, the bronze medals going to Ferns and *Lycopods*, which were very nicely shown. Mr. Smee, Mr. Peacock, Mr. Wills, &c., also offered prizes. Messrs. Paul & Son, Cheshunt, contributed excellent boxes of cut Roses in splendid colour, Sultan of Zansibar and Duke of Connaught being particularly brilliant; and very fine single plants of *Lilium auratum*; and Mr. W. Paul, Waltham Cross, sent beautiful Roses and a bright collection of *Zonal Pelargoniums*. Mr. Peacock, Hammersmith, also staged a collection of his grotesque Cacti, &c. These aids constituted a valuable feature to the Show, and the contributors will feel a reward in the treat they have afforded, and the appreciation of their goodwill in encouraging a thoroughly deserving organisation. The Revs. W. Rodgers, F. Bishop, and a working Committee, with Mr. B. Dean as manager, conducted the arrangements, and Mr. Barron and Mr. Dean were the Judges. The day was fine, and the Exhibition was in all respects as successful as it was worthy of success.

## ROSE SHOW IN NEWTON STEWART, WIGTOWNSHIRE.

NEWTON-STEWART, and through it the surrounding districts, were treated to a novelty on the 19th. Never before had it a Rose Show. When the Rev. G. W. R. Mackenzie of All Saints' mooted the idea of holding such an exhibition to a few friends a month or two ago he was metaphorically frowned upon. It could never be got up—the country was too unkind to produce sufficient Roses to make up a creditable display—it would interfere with the annual Flower Show a month later—it would, in short, never do. But Mr. Mackenzie determined to try; and as a preliminary step set about canvassing his friends and acquaintances, and non-acquaintances, for the necessary money, until he was astonished at his own success. A schedule of prizes was thereafter prepared; and the handsome sums promised therein to successful competitors drew forth hearty support. Messrs. Dickson & Sons of Newtonards, county Down—perhaps the largest Rose growers in Ireland—promised blooms; Mr. R. B. Cant of Colchester, a great grower, also said he would compete and exhibit, though the boisterous weather of the early part of the week caused him to telegraph on Thursday that it would be impossible for him to do so; and nearly all the gardeners attached to the mansion houses in Wigtownshire, and a few in the Stewartry, entered heartily into the project. The local amateurs and cottagers also determined to do their little best; and altogether such promises of competition and ex-

bition were received that, weather favouring, success was certain.

And a success it was. Five long tables were filled with the loveliest Roses of all kinds. There were in all 1015 cut blooms shown, and when to this number are added the Roses in pots, those who had not the pleasure of being present may faintly guess at the splendid appearance the five tables, presumed to be the finest of the kind ever held in Scotland; certain it is that in London and elsewhere in the provinces of England, where Roses are supposed to grow in greater profusion, we have seen very ambiguous exhibitions in every way inferior both as regards variety and excellence. And not only so; but a week or ten days ago the Roses—local blooms at least—would have been very superior to what they were yesterday; wind and rain having played sad havoc with many a cherished tree. But this notwithstanding, the show of Roses from Galloway was in the highest degree creditable; and not until yesterday could we have believed that the province would have produced such a brilliant display of every kind of the lovely flower.

Besides those sent for competition there was a table-load "for exhibition only." Messrs. Kerr & Fotheringham's display was very large and beautiful; that of Mr. Service, Maxwelltown, was also good; and the "exhibited" Roses from Kilmure Castle and Monreith were also very much admired. In the centre of this display was a miniature cottage, "Wigtown Lodge, Barnbarroch," the handiwork of Mr. Henderson, the forester. It was decked out with walks, and made gay with Roses; and during the day it had hosts of admirers. The Judges put a "commended" ticket upon it. A *Yucca gloriosa*, from Logan, was said to be as fine a specimen as is in Britain.

## IN THE WEST COUNTRY.—No. 2.

MR. CURTIS'S NURSERY, TORQUAY.

Mr. impressions of Torquay had been derived from various sources—from the remembrances of those who ever spoke of it with sadness as the last earthly home of those they had loved, where they had been taken to wither and to die; from those, too, who had gone there in the full floodtide of health and life, and had brought back from it glowing accounts of its beauty and salubrious climate, and also from those who have spoken of the facility with which tender plants are cultivated there; and it was, then, with a wonderment of what I should find it to be that the day before the Exeter Show I determined on visiting what in a horticultural point of view I had ever connected with the Tea Rose, and with that most charming of all English-raised Roses, *Devoniensis*.

It were idle for me to attempt the description of its scenery, and I might get a rap across the knuckles too; for I think I have a dim recollection that a certain awful personage who affixes "G." to his papers did, some years ago, in the *Journal* tell of his wanderings in these western parts. Suffice it to say, that although I had heard much about its beauty I was in no way disappointed. The lovely coast scenery of Batcombe Bay and Ansty's Cove must be seen to be appreciated. Living as I did so long in our bleak eastern coast, where nothing but the Tamarisk will thrive, it was indeed a treat to see the coast clothed to the water's edge with luxuriant foliage, and the beautiful contrast of the white sand and the rich red of the rocks, and to hear the cuckoo and the blackbird close to the very shore. Are not all these things written in the guide books? and therefore I must mention those things which pertain to our beloved flowers. Mr. Curtis most kindly met me at the station and took me to see what he has not unworthily styled the Devon Rosery, for there is very little else thought of or cultivated here than the Rose. In these days, when ten and twelve acres and more are devoted to the culture of the Rose, Mr. Curtis's of seven may seem small; but there is much to interest a Rose-grower in the collection that he has gathered together. He himself comes from a family in whom a love of flowers is hereditary, and Mrs. Curtis is a true helpmeet for him in what is both a matter of profit and a labour of love; and it is this long connection with horticulture that makes him so well up in Rose lore. His nursery is intersected by the railway, and his gardens on the north side contain, besides his Roses out of doors, his range of houses which are devoted to the culture of Roses in pots, especially Teas; and as Torquay is a winter residence his object is to arrange his flowers that he shall be able to cut them during the winter months. He has one span-roof in which the Roses are planted out very close, and, running up, cover completely the roof. These were then nearly all out of flower, and the lights were taken off to harden the wood. Two new houses had been built 180 feet each in length, and they were filled with a choice collection of Roses in pots, which were evidently intending to make a bril-

liant and beautiful display by-and-by—not large overgrown plants, but compact half-specimens. Among his favourites were Catherine Marmet, *Devoniensis*, Marie Van Houtte, Souvenir d'un Ami, Adam, Niphotos, &c. We agreed as to Duhauss of Edinburgh that it has very little if any Tea blood in it, and is little else than an improved *Cramoisis Superieure*. There was a long border in which the new Roses were planted, but owing to the backwardness of the season many of them were not in flower, and in those that were we could not discover any very great merit. Thomas Mills is brilliant in colour, and as it is very vigorous may be a useful garden Rose. Duhauss of Edinburgh (Bennett) will, I fear, not be a favourite; it is so very easily spoilt by wet, and neither here nor elsewhere have I seen a good bloom of it this season. Capitaine Christy promised well, but it is, I fear, also very easily spoilt. I have not seen for some time a finer piece of standards; and it would appear others thought so also, for Mr. Curtis had an order for four thousand from one firm alone—a firm, by-the-by, which has 140,000 Roses on Manettia.

We had much pleasant chat about Roses. Mr. Curtis thinks highly of the *Celine* and of a stock called *Donna Maria*, while he is cultivating another of which we may perhaps hear more by-and-by. He did not apparently think so highly of the seedling Briar as some do, although the French have used it for a long time for their Tea Roses, which are so largely grown here. He stated amongst other things in connection with Rose culture that he remembers well a thousand varieties being grown by his father in Essex, and this before the race of Hybrid Perpetuals was known; of these no more than five or six are grown now. It was, I believe, he who introduced *Brennus*, still a handsome summer Rose; while of late years *Bessie Johnson*, a sport from *Abel Grand*, has emanated from this nursery, and Mr. Curtis was the principal distributor of *Climbing Devoniensis*, although it does not owe its origin to him. He is very strong against the scentless Roses, and said Victor Verdier ought to come under the hangman's hand, as to it we owe the many beautiful but scentless Roses which even with this defect we cannot do without. In talking of *Cloth of Gold* he mentioned the case of one he knows in Jersey, which was planted at the base of a rock, and which ran over and covered a surface of 60 feet and was every season filled with bloom, and was indeed a grand sight. I have heard of one belonging to a tenant of Mr. Baker of Exeter, which is grown on his cottage and pruned every year with a hook as high as he can reach.

After lunch we had a pleasant drive to see the lovely coast scenery of Batcombe Bay and to call on my old friend Mr. Gosse, and whom I sincerely regretted to miss. He has a charming little villa, where he rejoices in the culture of Orchids and various other plants; and as the day was fine and the view of the coast lovely it is one to be gratefully remembered, and I only regretted that an engagement at Exeter compelled me to hurry away from my kind friends and hospitable entertainers, and I also regretted that the time at my disposal did not permit me to visit Mr. Veitch's nursery.—D., Deal.

## CATERPILLARS AND GOOSEBERRY TREES.

DURING the present year the Gooseberry crop is one of the largest in my recollection, but it has been sadly marred by the ravages of caterpillars. Many specifics for this I have heard recommended, and it would be well if discussion in the columns of your *Journal* should lead to one infallible remedy. Of all that I have hitherto heard recommended some growers take exception and pronounce them worthless. It has sometimes occurred to me that many failures might result from the carelessness or want of skill in the operator trying the experiment. I have heard many assert that they have kept their Gooseberry bushes intact from caterpillars by simply placing in the centre of each a bunch of Gorse or Heath, whilst others who have tried the same have pronounced it inoperative.

The most certain remedy which has come under my personal experience is to dust freely the lower portions of the trees and the ground around with powdered fresh lime. This invariably prevents the first attack, and if a little care be exercised in the later stages the few which survive the operation of the lime may be easily removed. Of course in a very wet season the lime is apt to be washed away and its effect weakened by the rains, and it would be well to renew it later on.

Recently, whilst on a visit to the Lake district, I was shown a garden where there was such a wealth of Gooseberries that

every tree required support to enable it to bear its load. I observed to the owner that the bushes appeared to be singularly free from caterpillars, and he then challenged me to find a single one on the trees. He next called my attention to the quantity of weeds growing amongst the trees, and said he attributed the immunity to the weeds. The garden was an open one, in no place sheltered by larger trees, and surrounded on three sides by fields of hay grass. In another garden some 30 yards away were two or three Gooseberry bushes around which were no weeds. These had scarcely a leaf left upon them, and were badly infested with caterpillars.—BETA.

## FLOWERS OF HARDY TREES AND SHRUBS

AVAILABLE FOR DECORATIVE PURPOSES.—No. 1.

It would certainly be limiting the term "beautiful" to a very restricted class of flowering plants was it confined merely to those to which a great deal of care is required in the cultivation, yet somehow we are very liable to underrate the merits of those which owe nothing to us for the highly ornamental appearance they put on in their respective seasons, very often, in fact, arraying themselves in their inimitable garb in spite of our neglect, if not absolutely ill-treatment. Fortunately, however, these beauties are not entirely wasted, for the poet and naturalist have long admired our woodland scenery, and have depicted its attractions.

As instances of Nature's decoration we have wild flowers a considerable part of the summer, and trees are ever beautiful; some, as the Oak, that are not conspicuous in their inflorescence in spring are highly so in the fall of the leaf in autumn; while the wild Cherry is very remarkable at both periods. The beautiful crimson tint the autumn leaves put on render its appearance ever grateful to the admirer of autumn foliage, and the wonder is it is not more patronised; the spring flowering being especially rich, and the tree not by any means fastidious as to situation, while when arranged in its white apparel in April and early in May it is a striking object, and well worthy a place at the back of a shrubbery, or front of a plantation or wood. Not less ornamental is the common Hawthorn. And how many gentlemen's parks are beautified by old venerable Thorns scattered about in all directions, each one vying in symmetry with the best-managed exhibition plants? The Thorn, however, has been augmented with innumerable varieties, but the common one, nevertheless, is still amongst the most beautiful; perhaps the Double White may be equally good, and some late-flowered varieties are also showy. We omit the other members of this great family, but the Blackthorn demands a passing notice as being much earlier and consequently harder. Its blooming is often delayed by the cold weather which it has to encounter; a few days, or perhaps a whole week of that time, receiving the name of the "Blackthorn winter" in many districts from the very common occurrence of a cold wintry period at that time. But the Blackthorn falls short of the Hawthorn in beauty or practical interest, but associated as it is with the Plum and Damson, and flowering when they do also, it is deserving of notice. The Crab (thanks to cultivation) is but rarely met with now-a-days compared with what it was formerly. The object of rendering it useful has induced some one or other to graft them, very often when in anything but a promising place, and a good Apple is substituted for the Crab. Now and then, however, the original is found, and when in flower it is needless to say is very handsome.

But we must turn to something else, and as a harbinger of spring what is more welcomed than the soft silky tufts of inflorescence we are accustomed to call "Palms"? How many old-fashioned hedgerows and coppices do they give a charm to in early spring? Many of the species are exceedingly handsome, some in which the claims of beauty rest with the male specimen, others again in the female. I believe Dr. Hogg has studied this genus with great success in the way of pointing out the most showy species, and I have a faint recollection that the male variety of *Salix vitellina* and the female of *S. amygdalina* are especially handsome when in flower. At all events the presence of palms forms an epoch in early spring alike cheering and interesting to all who are any way connected with country life.

We next come to the Gorse, Whin, or Furze, an object widely different, and of late years much persecuted. The taking-in of vast tracts of land, the abolishing of commons, and agricultural and wayside improvements have done away with vast tracts of Gorse land that used to be in a certain degree public

property; but enough remains to prove its beauty to the most casual observer, and when in full bloom where is the cultivated plant that can compete with it in gorgeousness? a vast breadth of it giving a more close and compact body of golden colouring than can be given by the best-managed bed in the parterre. The charm of a mass of Gorse in bloom need not, however, be dilated on further, and that of the Broom may be added in the same category, as both in some degree partake of the same character of liking dry stoney ground. Possibly the Broom is disappearing faster than even the Gorse; for apart from the persecution it receives from the lords of the creation, game attacks it where it abounds, that it is with difficulty preserved where hares and rabbits exist, there being nothing they are more fond of. On its handsome bright yellow flowers it is needless to dilate. Usually where it is found in great quantities the *Rhododendron* will be found to succeed pretty well.

In my next I will take a glance at higher-growing objects, and note that even the most common trees possess a certain amount of beauty when examined carefully, which is not generally admitted or sufficiently appreciated.—J. ROSSON.

## THE ROYAL HORTICULTURAL SOCIETY.

THE Prince of Wales presided on the 23rd, at Marlborough House, over a meeting of Her Majesty's Commissioners for the Exhibition of 1881. There were present the Duke of Buccleuch, the Marquis of Lansdowne, Lord Spencer, Lord Carnarvon, Lord Granville, Lord Aberdare, Sir Stafford Northcote, Sir Bartle Frere, Sir William Knollys, Mr. Playfair, Sir William Anderson, Sir Francis Sandford, Mr. Edgar Bowring, Mr. John Evans, Mr. Field Gibson, General Ponsonby, General Probyn, and Major-General Scott, Secretary. Sir Henry Thring attended the meeting at the request of the President.

The Commissioners considered a proposal from the Council of the Royal Horticultural Society to the following effect:—

"1. That the Society should raise its annual income from subscriptions to £10,000, an amount that would provide adequately for the promotion of the science and the encouragement of the practice of horticulture, and for the efficient maintenance of the gardens.

"2. That the Commissioners should waive the imminent forfeiture of the lease for non-payment of rent for a sufficient period to give the Society an opportunity of re-establishing itself."

The Commissioners accepted this proposal as the basis of an arrangement.

## REDLEES, ISLEWORTH,

THE RESIDENCE OF W. F. WATSON, ESQ.

JAMES'S Calceolarias, Cinerarias, and Prolific Marrow Peas have attained a very deservedly wide reputation, and have become what may be termed household words in every garden. Redlees has by them become celebrated, and a brief notice of the garden cannot fail to possess interest, and, it may be, afford instruction. Like so many other places where the best of gardening is to be met with, this is not an extensive and showy demesne, but is the suburban villa of an affluent and liberal-minded gentleman, who by the encouragement he has given to the good keeping of his own garden has raised the standard of some of our most popular flowers, has stimulated their culture, and made them better to fulfil their purpose in the adornment of other homes.

The mansion is a commodious red brick building, to which is attached a spacious conservatory. The grounds are generally flat and park-like, containing a few fine old specimens of Cedars of Lebanon and numerous other Conifers of less venerable aspect. Wellingtonias are very numerous and healthy, a belt of these and the best sorts of Cupressuses probably a mile or more in length, forming an attractive boundary to the grounds. These have only been planted about nine years, and the progress they have made is remarkable. The soil is not only good—a medium hazel loam—but it was thoroughly and deeply trenched, and the plants were planted when in a small state. Mr. James worked on the principle that small plants well planted are more satisfactory in their progress than are large specimens which receive a check by removal from which they are often a long time recovering. The size and condition of these specimens now prove that he was right.

The lawn is of considerable size, and is not overcrowded with flower beds, these being mostly arranged by the sides of the

walks, and planted on the carpet system, some of the designs and combinations being exceedingly chaste and effective. But hardy garden flowers are also cared for, Mr. James being not only a grower but a raiser of Carnations, of which he possesses many fine varieties. The flower garden also includes a rosery, and although newly made has produced a rich display of splendid blooms, some of these on cut-backs planted in the autumn producing flowers of almost equal merit with the best-exhibited blooms of the season. The soil is all new to the depth of 2 feet, and is composed of heavy loam and manure, and hence the vigour of the plants.

The glass structures are not very extensive, but are in good order, and are well adapted for their purpose. The plant houses are light with high stages, so that the plants are as near the glass as possible. Some are of north aspect, and are useful for retarding, and have in fact kept Show and Fancy Pelargoniums in perfect freshness to the present time. These plants are grown to a state of great perfection, being perfect globes of bloom from 2 to 4 feet through, and the foliage curling over and almost hiding the pots. The plants are now out-doors ripening their wood, being turned on their sides on wet days. They will be cut down at once. It may be said here that those who intend to increase their stocks of Pelargoniums cannot purchase plants at a better time than the present, for each plant will afford cuttings to be put in forthwith. At this season of the year there is no better plan of striking Show Pelargoniums than by inserting them in sandy soil in the open air and in the full sun. These make stocky vigorous plants, and if the wood is well ripened very few cuttings fail to emit roots. The Fancies strike better in pots under glass. After being cut down the plants are left in the pots to break, and are then shaken out. This shaking-out is a complete work. Every particle of soil is washed from the roots, and these are trimmed and repotted in smaller pots, throwing in a dash of silver sand as the work proceeds. These cleansed roots forthwith emit vigorous spongioles, and the old plants are made new again. The Fancies are treated in the same manner, but they are less robust and long-lasting, and in order to gain vigour they are often grafted on the Show varieties. Grafting is done at the present time, the stock being in advance of the scions, and the grafted plants are stood on a north or shaded border until the union is completed. By that simple means vigour is imparted to tender and delicate varieties.

Calecolarias are ripening their seed, and the sowing of next year's crop is usually made about the last week in July. The seed should be sown thinly on light soil previously watered and covered with a square of glass, and the seed pans be placed in a cool, moist, shaded place out of doors. Then is germination certain, and the young seedlings come up stoutly and sturdy. By twenty years of steady perseverance Mr. James has brought this flower to a high state of perfection. His strain is notable for high colour, large blooms, and dwarf plants.

Cinerarias are equally well grown, and the improvement in this flower is also very marked. Seed is sown at the present time, and treated the same as for Calecolarias. When sown earlier the plants are liable to receive checks by a dry atmosphere. Mr. James's plan is to secure a regular progressive growth from the moment the seedlings appear to the time the plants are perfected, and his great success is the best proof that his treatment is correct.

Cyclamens are grown exceedingly fine; indeed, those who have not seen the best examples of the few great growers of this flower have no idea of its extreme beauty. The corms are now being potted. A soil composed of two-thirds of turfy loam and one-third of dry lumpy cowdung, and a free admixture of silver sand, is the staple compost. The plants are kept rather close in cold frames to start them, and they are frequently sprinkled with water to induce a free and healthy growth.

A great point in Mr. James's success as a plant-grower is the diligent war waged against insects. Pelargoniums, &c., are regularly fumigated, and Cyclamens are dipped, not so much to kill insects as to prevent their appearance on the plants. Not only is this preventive plan emphatically the most effectual, but it is also by far the most economical.

At the present time the Fuchsias are the most attractive plants at Redlees. They are veritable fountains of bloom, not large, but in rare health. They are not trained to any fancy style, but are left, as Mr. Taylor so nicely puts it, to Nature and her own sweet ways, and we are of those who believe that no other way is so good in the training of this elegant flower.

Mr. James is turning his attention to the raising of seedlings, of which he has some promising varieties. He also grows Auriculas well, and holds a rich and valuable collection. These are reported and placed in a shaded place. Ferns and Orchids are grown for decorative purposes.

The most attractive plants in the stove are the Achromenes. They are not mentioned because they are large, but to draw attention to Mauve Queen, a variety which all should possess, for it is exceedingly fine in size of bloom, substance, and colour. Before leaving the plants we may note that old Epacris cut hard in like Pelargoniums were breaking freely, but Heaths treated in the same manner will never break again.

Besides the houses for plant-growing Mr. James has ranges of low brick pits, along the front of which runs a row of hot-water pipes. These pits are staged, and are so arranged that the stages can be raised or lowered at convenience, so that the plants are always close to the glass. These are valuable aids to plant-growing. They are better than houses, and the most cheaply made and heated of all glass structures; they should be provided in every garden where good plant-growing is expected.

But being a "plant place" it may be supposed there is no fruit at Redlees. Let us step into the vineries. The Black Hamburgs are mostly cut, but Vines thirty years old have carried one of the most useful crops we have ever seen. The berries are perfect in size and finish, but the bunches are not large. How could they be when we count on one Vine with two rods fifty-two bunches averaging three-quarters of a pound each? The rafter may be about 18 feet in length, so that it is seen that the crop is a very fine one. Lady Downe's Seedling is carrying about forty bunches to each Vine, and Muscats are perhaps still finer. These are grown on the extension system, and all the roots were lifted last autumn. Considering this the crop is very heavy, to heavy surface-dressings of rich manure on the borders is to be attributed this very satisfactory example of Grape-growing.

The kitchen garden is outside the grounds. We cannot notice its contents, having only space to say how James's prolific Marrow Pea is looking at home. Mr. James can show grand rows of this sterling Pea. It grows 8 feet high, is extremely robust, and laden with pods down to the ground. The pods are fine, well filled, and in colour light green. For productiveness and quality this is one of the best Peas which has ever been raised, and the rows now growing are amongst the finest features of Redlees.

### CURL IN POTATOES.

The curl in Potatoes is said to be entirely prevented by taking up such as may be intended for seed two or three weeks sooner than would be advisable for the general crop. It was known to many of us long before the year 1845. My opinion is that the curl and the Potato disease is one and the same, only different in the form of attack.—W. GILES, *Notting Hill*.

[The curl began in 1792.—Eds.]

### THE LOWER GROUNDS, ASTON PARK, BIRMINGHAM.—No. 1.

WHILE these Grounds are celebrated as a popular place of resort for the inhabitants of the metropolis of the midlands, they possess a much wider interest as having been the site of some of the finest horticultural exhibitions of recent years. The ability which has been exercised in the formation and management of these Grounds and the enterprise of Mr. Quilter in inaugurating the great annual horticultural gatherings, are such as to demand the recognition of all who are interested in horticultural pursuits. The more is this the case that the object of these exhibitions is pre-eminently worthy, as, on the one hand, conferring benefit on a valuable institution, and on the other as stimulating and encouraging the spread of high-class gardening. Such gatherings as those with which the Lower Grounds are identified have a direct tendency to popularise horticulture, for by bringing together the best of the earth's products in a densely populated district, and this in a manner to arouse a general interest, a love of gardening is engendered, and a spirit of emulation is fostered which cannot but lead to a salutary end.

But besides the popularity of these Grounds—a popularity brought about by a combination of tact, skill, and liberal-minded policy—they are in themselves worthy of a visit both

as regards their attractive arrangement and the good examples of decorative gardening which they portray. On both these grounds, therefore—their renowned public character and their intrinsic merits—we draw attention to them in a form of which they are worthy, and as being a pleasant rendezvous to any wandering tourist interested in the beauties of nature and art. In these Grounds, however, art predominates, for their aspect is modern, but the touches are so delicate that in many places it is hidden, and the landscape effect, while being essentially artificial, is in its character pleasingly natural. This is seen in the broad expanse of turf and water, the disposition of rustic bridges, which have a use as well as imparting an ornamental feature to the Grounds, and the arrangements of a great portion of the flower gardening. But undoubtedly the attractiveness of the Lower Grounds is heightened by contrast with the Aston Hall estate adjoining. The old Grounds are im-

posing by their venerable aspect and the noble trees which surround the quaint old mansion. These call up reminiscences of a past age, while the Lower Grounds by the modern nature of their treatment—the combination of flowers, shrubs, and lakes—exemplify the present. The only thing venerable in the Grounds is the old Oak which is shown in the engraving, and which measures 9 yards in circumference at the base.

The Grounds are about forty acres in extent. When taken possession of by Mr. Quilter ten years ago they were in a semi-wild state. There was then no hotel, flower garden, green-houses, conservatory, boats, &c.; indeed, nothing to attract visitors, the leading object being to realize capital by fruit from the old trees and by cut flowers from the borders. Mr. Quilter at once commenced a series of improvements, which have been going on to the present day, to keep pace with the times and to attract the interest of visitors. Many acres of

Fig. 12.—ASTON PARK—ENTRANCE TO THE LOWER GROUNDS.

turf have been relaid, lakes have been made, shrubs have been planted, walks have been widened, and flower beds laid-out. It is not unusual on special days for ten thousand visitors to congregate in the grounds, and the numbers are every year increasing. Many of the principal inhabitants are yearly subscribers, and have access to the grounds for promenade and recreative purposes. The number of men employed in the Grounds exclusive of attendants varies from twenty to thirty, and excellent order prevails under the able management of Mr. Spinks.

The islands in the centre of the lake—imperfectly shown in the illustration—with its rustic work and central Weeping Willow tree is very ornamental, and the standard Salix which fringes this lake are remarkably appropriate and pleasing. On one side of this lake are arranged a series of flower beds and shrubs, and on the other is the subtropical garden. The flower beds are now filled with the ordinary summer bedding plants, with which are effectively associated bedding Pansies. This is a combination of spring and summer bedding which it is useful to note. The same mode is also to be seen in Battersea Park, and is much admired by visitors there.

It is well known that for some weeks after bedding-out the Pelargoniums, &c., the beds are anything but gay—they are simply collections of plants struggling to establish themselves, but by planting in these beds lines or circles of the

bedding Pansies, the beds are made attractive in the early summer. The rich blue Pansies are very effective with silver-edged Pelargoniums; and the yellow varieties, in mixture with such plants as Lobelias and Scarlet Geraniums, add a feature of brightness to a garden when it would otherwise be almost destitute of colour. Such Pansies as The Tory, Alpha, Perfection, Golden Sovereign, &c., are valuable acquisitions to a garden in early summer, and being hardy and of easy culture they can be raised without much trouble. These Violas bloom beautifully until the bedding plants proper become established, and contribute an aspect of cheerfulness at a time when flowers are especially welcome. When no longer required the Violas can be cut away. At no time do they interfere with the well-being of the autumn-flowering plants. Violas thus used may play an important part in early summer garden decoration. By their aid in these Grounds the beds were made as beautiful in June as they will be effective in August, which is a point of no small importance to those who would enjoy their garden not at one particular season, but who as far as is possible covet flowers at all periods of the year.

Spring and summer gardening is blended in another form. Broad lines and circles of the hardy Saxifraga cordifolia had been exceedingly effective in the spring, and now the broad foliage of the same Saxifraga affords a pleasing relief to the brightness of the Calceolarias with which it is associated.

Thus do spring and summer join hand-in-hand, and bridge over the too-flowerless month of June. This simple and effective mode of flower gardening is suitable to many places, and it is not unlikely that it will spread when combinations of other flowers besides those mentioned will suggest themselves as applicable to the object of making a garden attractive over a larger period than is the case at present.—W.

## CHAPTERS ON INSECTS FOR GARDENERS.

No. 2.

THERE WAS a man of some note in the scientific world who went to pay a summer visit to a country person, an old school-fellow of his. He was much inclined to do the agreeable, so when his friend asked him if he would give a little sort of lecture or talk on natural history in his schoolroom there, the man of science agreed thereto. "But," said he to the cleric, "I'm afraid I may use by chance some words that your folks won't quite understand. I'll watch your face, and if there is anything that strikes you as being unintelligible, just touch your nose." This was agreed, and the audience assembled; after awhile the circumstances of insect life came under consideration, and the lecturer began a sentence with the words "In the metamorphosis of insects," when he saw his friend's finger lifted to the organ of smell. Quickly he changed his phrase, "In the transformations of insects," when the menacing finger went up again; and a third time he went on, "Or in what are called the changes of state in insects;" but again he was stopped, and, growing desperate, he said, "Or when they turn one thing into another," a statement unscientific certainly, yet so far intelligible that it raised a laugh, under cover of which the speaker proceeded to quote some simple and easily recognisable facts. I refer to this story to show how far from easy it is to most of us who speak or write on entomology, so far to popularise the terms of science as to make the unscientific individual perceive that we are desirous of being, not the obscurers, but the interpreters of nature. You may scrupulously avoid every word or phrase that seems technical or difficult, and yet, in your supposed simplicity, be far from making your meaning clear to the person or persons you address.

Now the changes insects undergo are puzzling to some extent even to those who make insects their study; and though one may glide smoothly over a phrase which comprehends them all, and say that there is first the egg, secondly the larva, thirdly the pupa, and fourthly the imago or perfect insect, it is not easy in many instances to separate one from the other, except, indeed, the egg, which cannot well be mistaken

for a later development of insect life. Unless in a rare case of accidental resemblance or mimicry, when we find an egg we are not likely to suppose it either a larva or a pupa; but when we come to define the two latter, and state what each is, and what it does, we cannot make an absolute rule. In the larval or second stage of their life we are wont to say that insects feed and move about; while the pupa is quiescent, living without food, unless, perhaps, atmospheric air in some instances afford a sort of sustenance. But there are pupae brisk enough in all reason, as amongst the aquatic insects of numerous species. Only a short time ago I brought home a dragon-fly pupa, displaying, visibly enough, his rudimentary wings, and he busied himself in taking sundry excursions up and down the plants in my aqua-vivarium, until one morning he popped his head above the surface and flew off, leaving

behind his filmy investiture. As he had conducted himself peaceably I brought home a larger pupa of that family, but he was no sooner "at home" than he began to devour his neighbours promiscuously. I bore with him while he drew "caddis" larvae out of their cases or portable dwellings, but when he savagely fell upon a young larva of a water beetle that I wished to rear I was obliged to serve an ejection. Then in some groups it is by a very imperfect move that larva advances to the dignity of pupa, and the pupa, again, develops into the mature insect. Nay, it might be said that some imagos are always pupae, were it not rather Irish. Instinct urges nearly all insects to the concealment of the egg, or perhaps we might state the fact better by remarking that from their minute size and usual location the eggs of most insects escape observation and need to be searched for. Pupae also are frequently hidden, so that it is in the

second and final stages that insects are best known to most people, even to the gardener and the entomologist. Yet could the gardener but be convinced how much advantage he might gain in the case of many species by searching them out and destroying them in the egg, the time bestowed on the work would be well rewarded. This would have the additional recommendation in the eyes of some sensitive persons, that it cannot be in the least degree cruel. Eggs certainly don't feel. Without going into minute details, which would be out of place, possibly tedious, in this series, which is designed to help the readers to take a general reconnaissance of the various orders, a few prefatory remarks on the transformations of insects taken as a whole will put us in a better position for our survey.

The old naturalists—not such fools many of them as modern "new-lighters" would have us believe—held to the axiom that every living thing comes from an egg, and therein they were anticipating what has since been as good as proved, only its

universality is hardly absolute. We come quite near enough to the truth when we say that most animals begin with this as the germ of their life, and it is palpable to the senses amongst the overwhelming majority of the insect tribes, and stands not on a mere theoretical basis. Of course there are such exceptions as we have in the aphid family, where through a good part of the year the happy mothers produce living young as spry and active as their parents, worse luck to the gardener; and then, again, certain species of flies in the Dipterous order of great destructive powers give birth to larvae, while there is also an instance of what is still more singular, the deposition of one or two pupæ by the parent insect in another genus of flies. It may perhaps appear to some readers to be a needless statement, yet I have met with educated persons who supposed that insects laid eggs, fed a little, laid eggs again, and so on—in fact producing broods much like birds; therefore I remark here that (with the exception of a few, such as the queen bee) when a female insect has deposited her eggs she dies. And this, her life work, after it has once been commenced, is gone on with continuously, until all the eggs are got rid of, whether they are laid *en masse*, in small quantities, or singly. Of course it doesn't seem a very affectionate way of phrasing it, but really it is a case of "getting rid" of the eggs with most insects. Only here and there have we a species that either takes any heed of her progeny after they are hatched, or lays up any provisions for them on their first entry into this world of troubles. Nature prompts the mother to select what is the proper food for her offspring, and, having placed the eggs on or near that, be it animal or vegetable, the mother retires from business, and sinks into the grave to which the partner of her life has already gone—or, to put it in more matter-of-fact, dies off, to be devoured by some creature or another, since most insects, living or dead, are thus utilised. If there is anything in insect economy that strikes us as significant of a resemblance to maternal regard, it is such a circumstance as we notice amongst the Coccid or scale insects, where the gradually elongating and wasting female, as she clings to the branch, affords a shield-like protection to the young larvae she has produced, and probably also supplies them with the first food they swallow in some instances.

A remarkable proof that the insect tribes, by a primary law of life, are exposed to unusual dangers is furnished by the fecundity of the females in the bulk of the species. Hence in spite of the dangers arising to them from other animals that make them their prey, and the effects of unfavourable weather, with in addition sometimes internal and little-known diseases, hosts of species perpetuate themselves from century to century, where the soil and temperature suit their habits. Of late years in this country to some scarce or local insects the entomologist has been the worst enemy. The schoolboy's notion that a caterpillar was so named because it was a sort of creature that liked to cater for itself on our choicest vegetables, and that a grub got its name because it was always feeding, is not exactly true. The essential part of the caterpillar's name is the second half, describing as it does something that "pills," peels, or devours what it comes in contact with. The underground life of some grubs, no doubt, led to the application of the word to larvae either footless or scantily furnished with feet, and that keep themselves out of view as much as they can. Yet both words are used in a very loose way, though entomologists have now pretty well agreed to restrict the word "caterpillar" to the larvae of the Lepidoptera, and to the pseudo-caterpillars of some Sawflies which have much resemblance to the caterpillars producing butterflies and moths. It is true also that some of our forefathers applied the term "worm" to sundry slim larvae. A palmer worm, for instance, was a hairy caterpillar, because it resembled the roughly-clad palmers that had returned to England from wandering on Asian shores. Unfortunately, too, the word "grub" has been used by some writers when they were speaking of insects in their third stage—the pupal condition. On the whole we cannot fall back upon a better word, as generally denoting the second stage of insect development, than Swammerdam's "*larva*," mistaken in a sense, as he was in choosing it impressed with the belief that under the skin of the larva the "masked creature," even at its escape from the egg-shell, were all the organs in miniature of the perfect insect. This we now consider to be a mistake; there are throughout points of resemblance, but the larva and imago exhibit different structures and functions, necessarily connected with differing modes of life. Still we do not quarrel with the term "*larva*," as handily expressing the second stage

of either a moth, a fly, a beetle, or a bee. Widely diverse these from each other, as we shall see hereafter, yet all having something in common. More unlike, it may be, too, than are the matured or fully-developed insects; thus the six-legged aquatic larvae, well-known to the angler as caddis worms, produce imagos which are not without resemblance to Lepidoptera, and have been called water moths, though the larva is so different from the average caterpillar of true moths. Certain flies and bees are much alike, yet the larva in the one is footless and in the other provided with six feet. And yet amongst other bees where the larvae are dependant for food on the attentions of their nurses or foster parents, they are footless, evidently still more incapable of shifting for themselves than the larvae of many flies. To the superficial observer it is quite obvious that the caterpillar of a butterfly, the larva of a beetle or of a bee, is in appearance, as well as in habit, quite different from the insect as it presents itself to us in the final stage of life. But then, again, the larva of a cricket, or that of an aphid, is an approximation to the imago in form, though destitute of wings. Also we have various instances, as amongst the flies and the dragon flies, where the two or four-winged insect is developed from an aquatic larva; certainly, however, it is as unamiable in habit as the predacious imago.

The amount of food "put away" by insects in the last stage is sometimes considerable, yet the larval condition must be deemed the grand feeding-time in the insect world generally; just as the pupal state indicates assimilation and preparation for change. Though, as hinted already, there are some active pupæ, yet as no pupæ are found either to grow or to moult, the nutriment they consume must be small in quantity. And here, again, we have strange contrasts and odd resemblances; beetles and bees, so remote in many respects, are akin in having pupæ which display very distinctly in the majority of species the outline form of the perfect insects, while butterflies and flies (with exceptions) approach each other in being developed from pupæ which give no clue to the nature of the insect enclosed, or only a slight indication. The agile pupæ of such insects as dragon flies and grasshoppers hint to us what they are about to become by displaying rudimentary wings. As to the length of life in these earlier stages, it is as a rule more prolonged than in the imago condition. We have larvae, it is granted, that attain their seniority in a few days, but those of some beetles and moths live years; and the pupal state may be reckoned by days, months, or years.—O.

#### OUR BORDER FLOWERS—COUSINIA HYSTRIX.

THIS is a race of plants very little known and seldom met with in cultivation. They may not be so graceful in their appearance or so attractive in their habit as some other of our border flowers, and it may be their Thistle-like appearance causes them to look a little vulgar among their more refined neighbours. But what if some of them has a rather Cardoon-like appearance? We sometimes find relief in change, and need not despise them for that. When taken well in hand they can be made very effective; and though we have a goodly number of white-leaved plants this adds one more to the number, and is not to be despised where large plants are required to fill large spaces for centres of large beds or for other purposes. Being hardy makes it still more desirable. When in the border fully developed, and seen at a distance with its silvery-white leaves and purple flowers, it is a very striking object, and a group in the shrubbery has a fine effect.

Though there are several kinds enumerated, I believe that *Cousinia hystrix* is the only hardy herbaceous one we possess. This is quite hardy, and when well established will last many years. It may be increased by seed sown in the spring, or by division after blooming. Care should be used in the operation, for they have fleshy roots which sometimes bleed and the plants go off. When the plants have attained a large size the stems ought to be thinned out that they may fully develop themselves. They require a well-drained situation, and will thrive in partial shade.

The ground for them should be broken up to the depth of 2 feet or more, and have some good loam, leaf mould, or good rotten manure, with a little coarse sand well worked into the place intended for them. They must be attended to with water when required, and when the flower stems rise they should be carefully staked to prevent them from being broken by the wind. Liquid manure is of service to them occasionally. When

liberally treated they will grow from 2 to 3 feet high. *C. macrocephala*, a biennial, may be raised from seed during the summer, and be kept from frost through the winter and planted out in the following spring. It is desirable on account of its yellow flowers. *C. cynaroides* is a biennial with white flowers. There are others that are equally interesting, and ought to be in more general cultivation.—*VERTIAS*.

### VENTILATION AND INSECTS.

DURING the last few years glass houses have sprung up as if by magic, so that no villa of any pretensions is considered complete without its conservatory, vinery, or orchard house. These appear to be necessary appendages to the residences of merchants and others who during the greater part of the day are engaged in business, many of whom are not in a position to keep a regular gardener. I will, for example, take the man of business who leaves his home, say, at eight or nine o'clock in the morning, and, perhaps, does not return before four o'clock in the afternoon. How do his pet plants or his fruit trees fare during his absence, with, perhaps, no one to attend to them who has any knowledge of such matters? Many difficulties and disappointments arise as to the proper airing of glass structures during the master's absence. Under such circumstances many impediments arise, not the least of which are the ever-troublesome insects. This must be patent to the practised man who reads year after year of so many antidotes recommended for their destruction. These remedies crop-up every year like so many patent medicines. Why should all these new remedies be required? If our forefathers could cope with insect pests successfully, why cannot we do so with the remedies still in our own hands? But it is not the practical gardener who is at fault and cannot cope with insect pests; it is, as a rule, the amateur who creates a demand for these remedies mainly by the cause of imperfect ventilation. I do not for a moment pretend to say that gardeners can at all times prevent these obnoxious visitors, as much will depend on the outer elements, but by proper airing and keeping a sweet atmosphere much that is obnoxious may be prevented, and much after-labour and vexation avoided.

Sudden changes of temperature are alike injurious to plants and fruits, and if judicious ventilation could be more generally adopted we should hear of less failures, for where ventilation is at fault disappointment will certainly follow. In many instances air is not admitted early enough in a morning. Suppose a tightly-glazed house is closely shut-up all night and the sun allowed to shine on it for two or three hours in a bright morning, this will raise the temperature at this season of the year to such an extent that a large volume of air must be admitted to lower it. Nothing tends more to propagate disease or insect pests than these extreme measures. Under such treatment both fruit trees and plants will become unhealthy, and will soon become a prey to red spider, mildew, or green fly.

During the summer months air ought to be admitted almost as soon as the sun shines on the glass. This, of course, applies to such structures where little or no shading is required. It is bad policy to let houses become too hot while the air within is stagnant; the top or hottest part is the proper place to ventilate first, even if it is but an inch, but this, of course, will depend on the outside temperature. Very tightly-glazed houses should during the summer months have a little air left on all night. It matters not how well a plant may be potted, and how correct the soil, and careful the watering may be, if the airing is at fault there can be no prosperity. There is more importance attached to ventilation than many people imagine, but in all cases avoid as much as possible cold cutting currents of wind, especially from a north or easterly direction; but this is difficult to guard against at all times, for with a fierce sun and a cloudless sky every inch of the ventilators must be opened, but in such cases plenty of moisture should be used to counteract the drying effects of such winds.

It is a bad plan to let the temperature fall too low before closing the lights; closing ought to be done gradually a little at a time. In shutting-up it is a good plan to husband as much sun heat as possible. A rise of 10° or 15° after shutting-up will do no harm when the sun is on the decline and the house is full of pure fresh air, but letting it rise to that extent in the morning without air in a stagnant atmosphere is decidedly injurious. It is often a difficult task to instil all this into the minds of young men who have such duties to perform.

As I have before remarked that insects cannot at all times be prevented, I will give an instance this season of green fly and red spider owing to the bright sunny weather and cold easterly wind gaining admittance to some houses. The red spider gained a footing at two or three ventilators in a house of Grapes. In this case there was no means of preventing the cold winds acting directly on the foliage. This attack is confined to the foliage near the ventilators, and is evidence of what cold easterly winds will do. The next case was green fly on Peaches. One point of attack was near to a front ventilator, the other near the door. I believe some people are very loth to admit that they entertain such society as red spider, thrips, and mildew, but such pests will make their appearance under the most skilful cultivators.

In many places it is almost an impossibility to keep free from these insects where mixed collections of plants are grown. In vineries and other fruit houses thrips will assert a right to a place, but the practical man knows how to battle with those enemies. For red spider a sweet moist atmosphere and a free application of the syringe; for mildew, flowers of sulphur dusted over the affected parts, and a well-ventilated and sweet atmosphere. For thrips, I know of no better or safer remedy than fumigation cautiously performed on two or three successive nights, this to be repeated in about ten days after the first application to destroy the after-progeny; but in small cases where perhaps only one or two plants are affected, careful sponging with a little soapy water, not over-strong, will be effectual.

I think that many of the horticultural buildings of the present day are not sufficiently ventilated, especially small houses with high-pitched roofs, which soon become hot and as soon cold again. This class of houses are difficult to manage, and are often to be seen adjoining the residence of the amateur. I believe that more evil is wrought by injudicious ventilation than by any other mistakes which are made in gardening matters. I advise all amateurs to have as a safety valve the top ventilators left slightly open all night, the air to be increased as soon as the temperature begins to rise in the morning, we should then hear of less destruction by insect ravages.—*G. R. ALLIS*.

### DEATH OF MR. STANDISH.

It is with great regret that we have to announce the death of Mr. John Standish, of the Royal Nursery, Ascot, Berks, which happened on Saturday last at half-past one o'clock, in the sixty-second year of his age. The disease with which he was afflicted was diabetes; with this he contended successfully for many years, but at last his constitution gave way.

Mr. Standish was born in Yorkshire, on the estate of the celebrated sportsman Colonel Thornton, on the 25th of March, 1814, and at the age of twelve removed with his parents to Calne in Wiltshire, where his father held an appointment at Bowood under the Marquis of Lansdowne. Having entered the gardens there, here it was that he gained his first instruction in gardening. After his apprenticeship was finished he went to Bagshot Park, where Mr. Toward was then gardener to the Duchess of Gloucester, and under him acted as foreman till he commenced business for himself as a nurseryman at Bagshot. The branch of gardening in which Mr. Standish greatly distinguished himself was hybridising. With this he began, and to this his life was devoted for a period of forty years. One of his first achievements in this way, and which brought him prominently into notice, was crossing *Fuchsia fulgens* and *F. globosa*, from which was raised *Fuchsia Standishi* in 1839. More than usual interest attached to this, for "it has been supposed impossible that *F. fulgens* should be a *Fuchsia* at all, especially in having an herbaceous stem and tuberous roots;" but says Dr. Lindley, "It now however appears, from the fact of its crossing freely with the common *Fuchsias*, that it really does belong to the genus."

Many other genera of plants formed the subjects of Mr. Standish's experiments, and notably the *Rhododendron*, of which he raised many beautiful varieties. It was to Mr. Standish when he was at Bagshot that Mr. Fortune entrusted the raising, propagation, and distribution of his Japanese and Chinese plants on his second expedition to the East, and it was through him that some of the most familiar trees and plants of our gardens were first distributed.

In 1862 Mr. Standish removed from Bagshot to Ascot, where he formed an entirely new nursery on a more extensive scale.

Mr. Standish leaves behind him many sorrowing friends. He was a man greatly esteemed by those who knew his genial disposition, kindness of heart, and disinterested generosity, and among these his memory will be cherished for many years to come.

**DISA GRANDIFLORA.**—A slight mistake occurred in the report of the late Show. It was stated that a *Disa* was exhibited in Lord Londesborough's collection of Orchids "similar to one exhibited in the Council-room by Mr. Bull." It should have been "similar in name," for both were named *D. Barrellii*. Mr. Bull's—or rather Lady Dorothy Nevill's plant, and grown by Mr. Vair—is the true variety. It is exceedingly brilliant, the flowers, six in number, being of a dazzling flame scarlet, and the plant itself was an excellent example of culture. It was stated to have continued in bloom since Whitenside. This fine *Disa* was greatly admired both in the Council-room and exhibition-tent.

#### NOTES ON VILLA AND SUBURBAN GARDENING.

THE HERBACEOUS *Calceolaria* has been a very fashionable flower for many years, and is prized both for window and greenhouse decoration. These plants are truly glorious when well grown, but they do not succeed well when cramped-up in small pots, for then the foliage never becomes developed, and in most cases it assumes an unhealthy appearance; therefore my advice is to grow a few of them and grow them well.

Now is the time to sow the seed. This should be done in a small pot or pan of light sandy soil. It must be sown as regularly as possible over the surface, and be very thinly covered with fine soil or silver sand; afterwards give it a very gentle watering, and place in a handlight in some shady corner on a bed of ashes, but free from the attacks of snails, which are exceedingly partial to the young seedlings. Never allow the surface of the soil to become dry after the seed is sown, or germination is seriously retarded. As soon as the young plants will bear handling, prick them out singly about an inch apart in pots or boxes, and place them again in a shady place and water carefully. Towards the autumn they will grow very freely, and must be potted into single pots, and when winter comes on they may be stored closely together in the greenhouse. About the beginning of January they will be making a fresh start, and must then be encouraged in every possible way by potting and other necessary attention. They like a good airy place, and not in the warmest part of the greenhouse, as they will endure more cold than many other plants; but this cold must not be frost. I have frequently wintered them in cold pits or frames, and they have always kept growing and have done well.

The soil may be a mixture of one-half loam and the remainder equal parts of very rotten manure and leaf mould, adding plenty of sand and broken charcoal to keep the soil open. Perhaps by February or the beginning of March they will have advanced so well as to need shifting into their blooming pots, which, to have good plants, should not be less than 8 or 10 inches in diameter. The fine leaves they make will be down close on the surface of the pot, and will need considerable watching against the attacks of green fly. This enemy is difficult to eradicate when it has taken hold of this plant, because if they are fumigated it is difficult to make the smoke penetrate between the closely-set leaves.

It will be found that after they have filled their flowering pots with roots that they will make surface roots just under the foliage. Now as this will happen about the time the plants are throwing-up their flower stems, it stands to reason that if these surface roots are encouraged the plants will be the better for it; therefore, top-dress them with some soil of the nature named above, and always keep them in a moist state, giving weak manure water about four times from that time till they show flower; and then if they are fumigated at two or three different times just before they flower they will go through the flowering in a clean state, and the flowers will be large and well developed, which will well repay the cultivator for his trouble.

—T. RECORD.

#### DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

##### HARDY FRUIT GARDEN.

It will be needless to say anything about watering wall trees at the roots this season, as reports from all directions tell of a superabundant rainfall; nor is it necessary to say that all fruit ripe or ripening is of very poor quality. All sorts of fruit require plenty of sunshine to bring out the flavour. Should fine weather set in now all out-of-doors fruit will be abundant and good, wall fruit especially so. Watering thoroughly at the roots and also overhead to destroy insect pests just after the stoning

period has invariably been necessary in this neighbourhood. This year Nature's watering has been much more effectual; indeed no more watering will be required this year. It has been necessary to look over the trees, especially those that have not yet filled their allotted space on the walls, to remove secondary growths, and to nail-in those young growths that have extended themselves since the first nailing. Nothing looks much worse about an otherwise well-kept kitchen garden than to see wall trees allowed to run wild during the summer months. As has been so often stated in previous numbers, no growths ought to be allowed to remain except such as may be required to furnish the tree or to bear fruit next year.

One fault in the culture of Peach and Nectarine trees on walls ought not to be passed over—that is, allowing the trees to become bare about the centre. It will not be possible, especially if the walls are high and the trees wide apart, to furnish the trees quite as well at the centre as at the extremities of the branches; but by careful training of the central growths, and by pinching or cutting back strong growths that are running away with the strength of the trees, central growths will be produced, and this will result in a more regular disposition of the fruit.

Where *Figs* are grown on open walls they will require rather different treatment from that recommended for other trees. Instead of cutting the wood away it is much better to allow nearly all the young wood to grow loosely. Mr. D. T. Fish, who manages *Fig* trees most successfully on open walls at Hardwick House, Bury St. Edmunds, has treated them after that manner; and in a small garden at Ilford there are one or two trees that annually produce and ripen large crops of fruit. The young growths hang out from the walls to the extent of 3 or 4 feet. *Figs*, like the Peach and Nectarine, bear only on the young wood; and if the trees are regularly pruned and nailed-in, the trees have the same fault of becoming bare of young growths near the centre; but on the "rough-and-ready" system recommended above it is not so.

Many persons may be desirous of propagating certain choice sorts of stone fruits. This is best done by budding them, and now is a good time to do it. The stocks should be two or three years old, and the buds usually do best if inserted on a clean part of the stem near the surface of the ground. As a general rule, it is much better to purchase trees in the nursery than it is to propagate them.

Just a word in answer to "A STURRY GARDENER" in last week's number about Celery. Why does he put "splendid quality" in inverted commas? I wrote "splendid Celery." I did not mean to convey the impression that there was any superiority in flavour of large over small Celery. Growers for exhibition, and for any other purpose where large heads are required, had better grow on the single-row system. "A STURRY GARDENER" and I both seem to be agreed in this; and as to quality, I am not aware that small heads are better than large heads.

##### VINES.

We have done but little in either early or late houses since our last notice in the "Doings," but owing to the dull damp weather a few berries have decayed where some fruit is yet hanging in one of the early houses. These berries were at once removed to prevent the decay from spreading. Do not let red spider spread on the Vines from which the fruit has been out. Take all care to preserve the leaves, and water the inside borders if they are supposed to be dry. As soon as the Grapes begin to colour in the late houses, if necessary give the inside border a thorough watering with manure water, or sprinkle the surface of the border with guano or pigeons' dung before applying clear water.

Those who have to supply very early Grapes, say in April and May, very wisely grow *pot Vines*. For this crop the best varieties are Black Hamburgh, and a few canes of Buckland Sweet-water if white Grapes are wanted. The canes should be ripened-off as speedily as possible if they are not already ripened, and to do this the house in which they are growing should be more freely supplied with air, and the canes to be fully exposed to the sun. Still water freely at the roots, and do not remove the plants out of doors or cease to maintain a high temperature until the leaves change to their autumnal tint. We never give any manure water the first year, and we always prefer Vines struck from eyes inserted in January or early in February to those that have been grown from eyes of the previous season. If the eyes cannot be started early, then it will be necessary to grow from small out-back canes. We have also found that the most productive wood is produced if the pots, after the Vines have been finally potted, are placed on a trellised stage or a slate platform immediately over the hot-water pipes. The best compost is medium clayey loam four parts, rotted manure one part, and an 8-inch poiful of crushed bones to be added to each barrowload of potting material.

##### CUCUMBER AND MELON HOUSES.

We are preparing plants for the winter Cucumbers to supply fruit from October until January. Those plants intended to supply Cucumbers from that time onwards ought not to bear

previously; of course this is not absolutely necessary, nor is it necessary at all if the plants are not heavily cropped. We have had the same plants bear continuously very nearly, if not quite, all the year round; but recently, whether owing to a change of loam or treatment, the plants do not grow freely. After bearing only a few weeks they have stopped growing, and after a few weeks' rest started again. We are changing the loam, and hope to have better results.

Melons have been poor in flavour this year. Even Scarlet Gem, which is usually good under adverse circumstances, has been of indifferent quality. Those who have only the usual old-fashioned box lights are almost helpless to improve the quality of their fruit in dull weather. In heated houses it is different, for by applying artificial heat and ventilating freely, with a moderately dry atmosphere, the flavour may be much improved in dull cold weather. By planting out at once in a heated house Melons may be obtained in October, after that month the quality of the fruit is bad. For late fruit the soil ought not to be rich; no manure at all should be added to the turfy loam, and only a very little rotted manure if the loam is of poor quality.

#### ORCHARD HOUSE.

Early Rivers Peach is the first to ripen, as we do not now grow Early Beatrix, which used to be a few days earlier; but the less said about flavour the better. It requires plenty of sun and a dry atmosphere to ripen off the fruit of this sort, and which cannot be perfected in an orchard house where Early York will not be ripe for three or four weeks. If a house could be devoted to the Early Peaches raised by Mr. Rivers, where they could have that treatment which they specially require when ripening, a very different opinion would be formed of them than has been formed by those growing the trees with other varieties not ripening at the same time. It is still necessary to syringe freely, and to keep up a high and rather moist temperature in the house.

#### GREENHOUSE AND CONSERVATORY.

We have been busy finishing the potting of hardwooded plants; *Heads* and *Eupacris* were amongst them. These require very similar treatment; the potting material is turfy peat, to which is added a liberal supply of white or silver sand. In some cases the plants and pots have become too large for us. When this was the case an inch or more of the ball of roots was sliced off all round with a chopper, and the plant placed in the same sized pot; after being established in the pot the plant will be reduced in size. *Camellias* have also been repotted, the compost being two parts turfy peat to one of loam. In potting *Camellias* the roots must not be injured, and any plants that have not made roots freely may have the old mould picked out with a pointed stick, and then be repotted in the same sized pot.—J. DOUGLAS.

### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

SHREWSBURY.—July 29th and 30th. Mr. H. W. Adnitt, Hon.-Sec.  
SOUTHAMPTON.—July 31st and August 2nd. Mr. C. S. Fulidge, 83, York Street, Lower Avenue, Sec.  
SUSSEX (Ottagers).—August 3rd. Mr. W. M. Hughes, Sec.  
WATTON-SUPER-MARE.—August 4th. Mr. W. B. Frampton, Sec.  
LIMINGTON AND SHIPLEY.—August 4th and 5th. Mr. R. Blount, Sec.  
NEWPORT (MORRHOUTHSIDE).—August 5th.  
OTLEY.—August 7th. Mr. Jno. Lee, Hon.-Sec.  
ROSEDALE.—NEWCHURCH.—August 7th. Mr. M. J. Lonsdale, Newchurch, Lettlesover (near Derby).—August 7th. Mr. B. Toft, Hon.-Sec. [Sec. CANTERBURY.—August 13th.  
NATIONAL CARNATION AND PROTEA SOCIETY.—August 13th and 14th, in Manchester Botanic Gardens. Rev. F. D. Horner, Kirby Malsard, Hon.-Sec.  
BURNOPFIELD.—August 14th. Mr. J. Hood, Sec.  
IDLE.—August 14th. Mr. H. N. Illingworth, Sec.  
GOVERNAT (at Coombe Abbey).—August 17th. Mr. T. Wigston, 3, Portland Terrace, Sec.  
DOVER.—August 18th.  
NORTHLEACH.—August 18th. Mr. J. Walker, Hon.-Sec.  
EASTBOURNE.—in the Devonshire Park.—August 19th. H. A. E. Bumble, Esq., 26, Hyde Gardens, Sec.  
GLASTONBURY.—August 19th. Rev. E. Handley, Hon.-Sec.  
PORTPOOL.—August 19th. Mr. Ernest Deacon, Hon.-Sec.  
HARTLEPOOL.—August 24th. Mr. Counsellor H. Magoris, Hon.-Sec.  
NEWBURY.—August 24th. Mr. H. Seymour, Hon.-Sec.  
ISLE OF THANET (St. Peter's).—August 25th.  
RAMSGATE.—August 25th. G. D. Smith, Esq., 8, Marine Terrace, Margate, Hon.-Sec.  
DUNDEE.—August 26th, 27th, and 28th. Mr. B. MacKellar, 51, Reform Street, Sec.

#### TO CORRESPONDENTS.

\* All correspondences should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (W. W. L.).—We have not seen the book you mention. Any bookseller in Worcester could obtain the information. (*O. M. W.*).—"Dixon's Treatise on Hybridisation and Culture of *Tricolor Geraniums*" can be had from our office, free by post, 6d.

GRAPES (J. N. C.).—Write to Messrs. Webber, fruitists, Central Avenue, Covent Garden.

CHRYSOMELID (R. H. D.).—It is a toad. The flowers only are used. Put a handful of them into a teapot that will hold a pint, and fill it up with boiling water. A wineglassful morning and night promotes digestion. If your plants never flower it is either because the soil is too rich or you have not the right species of Anthemism. We know of no book devoted to the culture of medicinal plants. That on garden plants is not published. Enclose five postage stamps and order our "Flower Glass Manual."

PEACH CULTURE (Novice).—Brabant's "Modern Peach Pruner" will suit you. You can have it free by post from our office if you enclose forty-four postage stamps with your address.

WINDOW GARDENING (B. J. F.).—"Window Gardening for the Many" contains all the information you require. If you enclose ten postage stamps with your address you can have it free by post.

ROYAL HORTICULTURAL SOCIETY'S SHOW.—Our reporter and the official advertisement given to us state that Mr. Brice was first in "air florists' varieties sent out in 1878, or not in commerce." Mr. Forsters writes to us that this is a mistake; Mr. Burley (not Bully, as stated in the official prize list) was first in this class with varieties raised by him.

SHOW PALANGONTES AFTER FLOWERING (*Pelargonium*).—Stand them outdoors in a slightly shaded situation and on a hard bottom, and in about three weeks out down each shoot at two or at most three eyes of the base of the last season's growth; and when they have broken and have shoots barely an inch long, turn out of the pots and remove all the old soil, trimming in the roots, and repot in a size less pot than those they were flowered in, and place them in a cold pit or frame, keeping rather close until fresh roots are formed, then admit air abundantly, protecting from heavy rains. At the close of September or early in October remove them to shelves or stages in a light airy position. In November they may be stopped, and in December have them in their blooming pots. Three parts turfy loam, one part old cow dung, one part leaf soil, and half a part of silver sand, forms a good compost. Zonals which have done flowering may be treated in the same way.

CATERPILLAR ON ROSE BUSHES (G. L.).—The green caterpillar foraging upon the leaves may be destroyed by sprinkling with white hellebore powder, 1 oz. to a gallon of water, well mixed, and sprinkled in the evening or early morning through a rose watering-pot. If any are folded in the leaves they must be squeezed.

POTATO SHED SAVING (Constant Reader).—So soon as the skins are set—as they for the kind you name will be by this time—take up, choosing dry weather, and place them on shelves in a dry shed cool and thoroughly ventilated, and but one layer deep, and if the shelves are of lattice-work all the better, as the seed will have air both above and beneath. On the approach of frost they should be moved to a situation free from it, and the cooler they are kept up to February, but safe from frost, the better. The first sprouts should be carefully preserved; the advising of keeping them cool is to prevent undue excitement. We are glad you will soon be able to fruit your seedling Peach trees.

MADENWILDE COURT GRAPE CRACKING (*An Old Reader*).—The probable cause of the berries cracking is too dry an atmosphere in the early stages of the growth, and an insufficiency of water at the roots during the first swelling period, and at the second swelling or ripening period the atmosphere is too moist, and the supply of sap, from too great moisture at the roots, excessive. It may arise from the low temperature you have kept, which would, from lessening the necessity for air-giving, tend to a closer and moister atmosphere. Keep drier and a good heat, admitting air very freely. The Vine is probably constitutionally weak, and unless it is at the second growth be strong, having been close cut-in, we should replace it by a fresh cane.

TOMATOES INFESTED BY INSECTS AND MILDEW (R. G. M.).—The white fly is difficult of extermination, for upon the application of tobacco smoke it, when the smoke is not dense, drops to the floor or soil, and is so far out of harm's way. Fumigation with tobacco we advise, having first flooded the floors with water; and after the fumigation, when the house is so free of smoke as to be endurable, syringe the house, and especially the plants infested, thoroughly with a dilution of tobacco, one gallon to six of water, and this will take the insects before they rise, and will destroy them. For the mildew, dust the infested parts with flowers of sulphur and admit air more freely.

CANNA CULTURE (Gwen).—The plants in pots you may either plant out or keep in pots in a greenhouse well supplied with water, shifting them into larger pots as they require it. If planted out they should have a sheltered situation, and a light soil enriched with leaf soil or well-rotted manure, and be well supplied with water in dry weather. After the first frost in October the roots should be taken up and be laid in a shed for a few days to dry, and then be stored away in sand in a cellar or other place safe from frost.

VINES AND PLANTS BROWNED (*A Thirteen-years Subscriber*).—The leaves you have sent us are scorched, probably from keeping the house too close and the foliage wet, which causes the leaves to be browned by the rapid evaporation of the water from their surfaces. Admit air more freely, and especially in the early part of the day, with a little at night. There is no trace of insects, and if the Vines have leaves in the same plight as those sent us of plants and Ferns, and the Grapes are just ripening, they will not do so perfectly, and the flavour will be poor. Shade the Ferns.

MELONS NOT SETTING (*A Subscriber*).—The female flowers you sent us are very weak, but are nevertheless perfect, and would set were the frame lined so as to give increased warmth, and admit of air being given not only in fine weather but in dull, and especially at night, for which there is great necessity when Melons are setting to prevent moisture being deposited upon the flowers. Leave a little air on day and night, whatever the weather may be, until the plants have set the fruit. Keep the Vines rather thin, impregnate

the flowers, and stop the shoots one joint beyond the fruit, not watering until the fruit be set. The wet weather and the position of the frame is not favourable to the Melons setting. The cause of the Cucumbers being bitter is an imperfect elaboration of the sap, caused by slow growth, which may be obviated by a freer growth, promoted by more bottom heat and a moderately moist well-ventilated atmosphere. Do not overcrop, as that retards the swelling of the fruits, and conduces to the bitterness of which you complain.

**GREENHOUSE FERNS (H. W. Rose).**—The following are superior:—*Adiantum concinnum*, *Lomaria gibba*, *Asplenium dimorphum*, *Cheilanthes elegans*, *Davallia pyxidata*, *Gleichenia dicarpa*, *Neottopteryx australasica*, *Nephrolepis tuberosa*, *Pteris acrostichum*, *Adiantum sulphureum*, *Asplenium Vetschianum*, and *Lomaria Balli*.

**PLANTING A VINE BORDER (E. C. S.).**—We cannot, having regard to the well-being of the Vines, advise that the border be cropped, and especially if the roots are confined to the 5 yards width of space. In the case of old-established Vines, the feeding roots of which have penetrated far beyond the border, the border itself may be cropped with flowers. We know at least one cultivator, however, who places 6 inches of manure on his Vine border in the autumn, and in the spring plants it with Stocks and Asters, and few have finer Grapes and flowers; he never digs the border. So much depends on circumstances and the primary requirements of an owner that it is not easy to advise correctly. If the Vines are young and fine Grapes are expected, do not plant anything on the border; if they are old, and ordinary Grapes are only looked for, and flowers are particularly coveted, you may follow the example we have given.

**NAMES OF PLANTS (L. E. F.).**—It is *Hydrangea japonica* var. *occidentalis*. So many offsets from a Lily bulb is very unusual. (*A. B. C.*)—It is *Chrysanthemum segetum*, known popularly as the Corn Marigold and many other names. Flies frequent it probably for some secretion which they like. (*G. L.*)—The shrub in flower is *Oenothera aurea*; the other we cannot name without flowers. (*S. E. T.*)—Certainly not a *Sedum*, but *Saxifraga aizoides*, (*J. A. M.*)—Yes, it is *Oxum* (or *Sium*) *verticillatum*; the other is *Gnaphalium* or *pimpinellifolium*. (*W. C.*)—1, *Campanula persicifolia*; 2, *Gaillardia pinnatifida*; 3, *Malva moschata* alba; 4, *Deutzia scabra*. (*Mrs. H.*)—*Doronicum pardalianches* and *Helenium grandiflorum*. (*Logan*).—1, *Silene Armeria*; 2, Not a Grass, *Isoplepis gracilis*. (*R. X.*)—1, *Eryngium sp.*; 4, *Centaurea* sp.; 8, *Acantholimon glumacum*; 13, *Galega officinalis*. (*E. H. F.*)—*Epipactis latifolia*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### CALL DUCKS.

We have been asked to say something concerning the habits and peculiarities of Call Ducks, and to do battle for them with the secretaries of shows that classes may be given for them. We will gladly tell all we know, but do battle for them with secretaries we really cannot, as that kind of work is not very easy. We have recollections ourselves of working up an almost unknown breed some three or four years ago and getting it classes; and though we to a great extent succeeded, still the trouble and correspondence attending it was too great to make us give time just now to go through it again. Nevertheless, we are certain there are many committees who will gladly give Call Ducks classes if only a certain amount of the prize money or a fair proportion of entries are guaranteed.

We certainly do not find much about this graceful little breed of waterfowl in the poultry books; but then there really is so little to say. When we know there are two varieties, the White and the Coloured, and that the latter resemble miniature Rouens, while the others are like Aylesburys with orange bills, then we have come to the tether of their notice in most of the books on poultry. We confess we should like to see them more cultivated, for they are when good exceedingly graceful and a great ornament to lakes and pieces of water. We have seen a fine flock of both colours mixed together on a sheet of ornamental water, and the effect was charming. We believe they were much more commonly found a few years ago at the shows than now, for since the lovely little ornamental varieties of waterfowl have come in the Calls have had to go on the shelf. We are glad to find, however, they have many friends left, and we shall cordially welcome classes for them; for really, though the Carolinas and Mandarins are such glorious little creatures that we can hardly begrudge them their prizes, still it must be galling to exhibitors of Black East Indians, Calls, Muscovies, and such-like to find their pets always having to put up with those unsatisfactory commended cards.

Calls are still frequently used as decoys, for their frequent "quack, quack," often entices the flocks of wild Ducks to descend and pay a visit to their cousins. We know of a beautiful piece of water in the midst of a large tract of Kentish underwood which has always been called the decoy pond, and where, thanks to the Calls which live there, wild Ducks can always be seen in the winter when they are not to be found anywhere else in the neighbourhood.

Perfect pens of Call Ducks are rarely seen, and our own experience tells us they are very difficult to breed good. They should be very small, have very short bills indeed, and high round foreheads, all of which points are difficult to obtain. The colour of the Brown variety should resemble a Rouen in every particular—legs, bills, feet, and plumage; while the White should be a clear white free from any cream-coloured tinge, with an orange-coloured bill quite free from black specks. The best Duck we ever saw in our life was in head points like a perfect

Almond Tumbler Pigeon, but she had a black mark or two on her bill, and was thus spoilt for successful competition; and though all her ducklings were clear in beak, still not one of them had the perfect head and bill of the mother. The only way to secure these short bills and full foreheads is to breed from no other birds but those with those points developed as much as possible. We find long-billed Ducks generally throw longer-billed ducklings. There is the same difficulty in obtaining them small as there is in Game Bantams, and as they have voracious appetites it is troublesome to keep them on short commons. We had a brood this year which we tried hard to keep small, and so fed them but seldom, making them find their own living; but these birds, as soon as they got their wing feathers, flew after the chicken-feeder from coop to coop all round the chicken field, and got a meal from every batch. The result is that as we write we can see at the water's edge half a dozen of what might be fair-sized Aylesburys. Call Ducks are delicious eating, and being a little large for this purpose is a feather in their cap.

We think the best way is in rearing for exhibition to hatch a good many, make them forage for their living as much as possible, and then, picking out the very best in shape, size, and head, serve up the remainder as wanted with cayenne pepper and lemon. Call Ducks make splendid sitters and admirable mothers, but they are not good layers, often only laying twenty or twenty-five eggs in a season, as they keep with their ducklings nearly all the summer.

For breeding they have to be kept in pairs; and though in the laying time the drakes fight and quarrel fearfully, as soon as their wives begin to incubate they live together in perfect peace. The ducklings are delicate when first hatched, and very susceptible to cold and damp. We have known whole broods of ten and twelve when three or four days old go off in twenty-four hours; but once two or three weeks old and they thrive wonderfully well.

We know of no Duck that is so graceful in the air as a Call Duck. They fly in small flocks, and seem to fly merely for the sake of flying, circling in the air like Pigeons, rising higher and higher, till presently they dash suddenly down right into their pond. We have never known a single instance of one flying away. On the contrary, they seem quickly to know their own bounds, and are as tame as any other breed of Ducks. In the water they are most attractive, and dive in the liveliest manner possible before the eyes of visitors without being the least shy.

As regards classes for Call Ducks we hope those who keep the breed will come forward and show committees that they will fill them, and then there is no reason why they should not have their class at many shows as much as the East Indian. They did have a class at Oxford last year, but owing, perhaps, to its not being in the regular schedule, only being pasted-in as an after-thought, only eight pens appeared, and unfortunately Mrs. Bailey's pen, which was the best of the lot, was too late for exhibition. Still, here is an opportunity for Call Duck fanciers, for we are certain if they will only guarantee Mr. King, the Oxford Secretary, this year twelve entries, he will see they not only have a class and three prizes but a silver cup as well. The Palace people, too, are enterprising go-ahead folks, and if help is only promised we are sure Messrs. Howard and Nicholls will do all they can for them. This is the only way to bring the breed to the front. Secretaries must be shown that a class will pay, and to do this for the first few times the hand must be put into the pocket and the shoulder to the wheel, and then all will be plain and easy sailing. This is the only way that Black Hamburgs, the French breeds, Malays, and even Brahmas ever rose from the unhappy destiny of a variety class. We confess we hope Call Duck fanciers will do this, for we know of no breed of waterfowl which is more attractive or lively in its ways, and with them striking in appearance and happy in disposition.—W.

### THE LATE BRISTOL SHOW.

FROM the number of inquiries received by me there appears to be a general desire to know the financial result of the poultry show held in January last. I shall be glad, therefore, to give the information through the columns of those journals which so kindly assisted with subscriptions and recommendation. The total receipts amounted to £1179 15s. 1d., and the expenditure to £1076 17s. 9d., leaving a balance in hand of £102 17s. 4d. Now, as the loss on the previous show was about £70, and as I increased the prize list in the face of such loss by over £120, it follows that the last show was nearly £800 better than its predecessor.

This is a very satisfactory result so far as the past is concerned, but now a word as to the future. It has been hinted to me that as the show produced a balance it must be self-supporting and will not need subscriptions in future. The amount of subscriptions received by me last year was £113 12s., exceeding the surplus by £11, and if everyone withdrew their assistance there would probably be a loss of that amount. In addition to this,

I last year did the whole of the work connected with the show without assistance, working night after night till three and four in the morning, to save expense; but I cannot undertake to do this again, and there will be the additional expense of a clerk or assistant secretary. The trouble, anxiety, and responsibility of carrying out a large show like Bristol is immense, but I do not mind that. I think, however, that if I, or anyone else, is willing to take this trouble, exhibitors and others interested should support with subscriptions. Bristol is essentially a show requiring such help, and I trust that exhibitors, especially local ones, will not be backward in coming forward in connection with the show I hope to bring off as usual in January next.—H. CAMMERMAN.

### CASTLE DONINGTON POULTRY SOCIETY'S SHOW.

This Show was held on Wednesday the 21st in an excellent marquee, and Turner's pens were used. Unfortunately the field was one mass of puddle through the previous rains, though with the exception of one shower the day was tolerably fine. In the Rev. R. Story the Society possesses a Secretary who will without doubt push the interests of the Society regardless of all obstacles; this case being a proof of that gentleman's energy and perseverance, for, having collected fifteen special prizes of the value of £100 each, the entries showed up well, and an excellent show was the result.

Cochins headed the list with six classes, but only the first in Buff cocks was good, the others being booked. Hens were all good. Partridge cookeys a fair lot, but hens good; while the White cookeys were very poor, the hens being a nice lot, the first and special falling to a most excellent pen. Dark Brahmas cookeys were poor with one or two exceptions; but the first was a very good bird except in size, in which he was beaten by the second, which, however, had neither as good shape nor colour. Dark Brahma hens were a moderate lot, while Light Brahmas were poor except the winners; in hens the prize going more to size, shape, and leg-feather than marking, in which point they were not equal to the second. Dorkings were rather shabby in feather, but good in size and feet. Except the winners the Houdans were not good. Spanish were both good classes, the special going to a very fine pair of hens. Red Game cookeys were a large class; but the first, a substantial Black-breasted Red, stood quite out, and won the special; the second, a Brown Red, in nice order; and very highly commended a most promising young Brown Red. In hens all were Black Reds, and very good. A Pile chicken won in the next class, a Pile cock taking second; but the special went to a pair of Duckwing pullets in the following class; the second were Duckwing hens. Hamburgs were good in all classes. In both classes of Pencils Gold were placed first and Silver second. The winners in all cases were really good. In Spangled cookeys Golden won both prizes, no good Silvers being shown; but in hens first were Golden, to which the special was awarded, and second Silver. A Gold Poland won in the Variety of cookeys, and with a Le Fleche second; the special going to a pair of handsome Black Hamburg hens in the next class. Chickens were a large class, and one of the best, if not the best, in the Show. First were placed a grand pair of Duckwing Game; second large well-shown Buff Cochins; third Silver Grey Dorkings; and fourth Light Brahmas, while many other commendable were given. Two classes were provided for Bantams; in cocks first was a smart Black-breasted Red, and second a Black Rose-comb; and in hens first were about the most perfect pair of Blacks we have seen shown, and which won the special; and second a pair of White-footed. The Sallings classes were good; in cocks first was a Buff Cochins, and second Spanish, the special going to Dark Brahma hens, and second to Spanish. Ducks were pretty good in both classes. Of Turkeys and Geese there were but five entries.

Pigeons had five classes, of the quality of four of which little can be said; but the Variety class was very good, with twenty-two entries and sixteen pens noticed. First was a perfect pen of Blue Dragons, second Black Trumpeters, third Red Barbs, and fourth Black Magpies, while there were some other Blue Dragons which were worthy of prizes.

is well known to all practical minds that they are not of the value of a good old hen. Very highly commended were a pen of chickens, and one of old birds. In next class first were Piles and second Duckwing, both very good; and very highly commended Pile chickens. In the following class Blacks were very good and won the prizes, the cup going to Black Reds. In the Variety class a grand pen of Turkeys were placed first and Guinea Fowl second, some capital Black Hamburgs very highly commended, Minorcas, Silkies, and Malays making up the class. *Bouen Ducks* were large but out of feather, and Aylesburys a moderate lot, the cup for this section going to a pen of White Embden *Geese* in the following class, the second being Toulouse.

**DORKINGS.**—1, C. Widdas, Beechburn Grange, Howden-le-Wear. 2, W. Morritt, Gooly, Yorks. 3, J. White, Warley, Northallerton. 4, W. Morritt, W. Swan, Bedlington. 5, J. N. Lawson, 6, A. Buglass, Carrville, Durham; 7, J. White, Barnham Footpath. 8, W. Swan. 9, B. Shield, Swallow. 10, T. P. Carver, Boroughbridge. 11, G. Lowther, Tow Law; 12, J. Jacques, Richmond, Yorkshire. **COCHINS.**—*Cinnamon and Buff.*—Cup, 1, 2, and 3, G. H. Procter, Durham. *Any other variety.*—1 and 2, G. H. Procter. 3, J. Filston, Gilegate, Durham. 4, W. Newbiggin, Newcastle-on-Tyne. **SPANISH.**—Cup and 1, H. Beldon, Gilegate, Bingley. 2, R. Shield, Swallow. 3, S. Hyton, W. Jagg, Blyth. 4, J. Craig, Bridge End, Frosterley. 5, H. Dale, Old Ormsby, Middlesbrough; 6, M. Saunders, Lancaster. **POLANDS.**—1 and 2, H. Beldon. 3, J. T. Froud, Binschester, Bishop Auckland. 4, A. Buglass, Carrville, Durham. 5, J. Jackson, Tow Law; 6, W. Bearpark, Northallerton; 7, C. M. Saunders, Lancaster. **FAMOUS FOWLS.**—1, C. M. Saunders. 2, Rev. J. G. Milner, Hamsterley, Bishop Auckland. 3, R. Smith, Seaford.

**GAME.**—*Black-breasted and other Reds.*—1, W. Youngusband, Darlington. 2, J. & E. Prince, Nantwich. 3, G. Carter, Bedale. 4, S. Hyton. 5, J. K. Smith, Eaglescliffe; 6, J. Young, Morpeth. 7, W. Bearpark; 8, Miss M. J. Nelson, Cockshaw, Hexham; 9, A. Buglass, Carrville, Durham. *Any other variety.*—1, C. J. Young, Driffield. 2, W. Bearpark. 3, Webster & Adams, Beverley. 4, J. Gibson, Stanhope. 5, A. Buglass; 6, J. Rowell, Lints Green. **HAMBURGERS.**—*Golden-spangled.*—Cup and 1, H. Beldon. 2, R. Shaw & Dean, Halifax. 3, R. Keenleyside, Aycliffe, Darlington. 4, W. Simpson, Frosterley. *Silver-spangled.*—1, H. Beldon. 2, J. Robinson, Garstang. 3, C. J. Young. 4, R. Keenleyside; 5, G. Barks.

**HAMBURGERS.**—*Golden-pencilled.*—1, T. P. Carver, Langthorpe, Boroughbridge. 2, H. Beldon. 3, R. Keenleyside; 4, A. G. Mitchell. 5, J. M. Lawson, Ryhope; 6, J. Jackson, Tow Law; 7, A. Stephenson. *Silver-pencilled.*—1, J. Robinson, Garstang. 2, H. Beldon. 3, R. Keenleyside; 4, E. B. Gardner, Appleby; 5, Davidson & Pattison, Morpeth; 6, W. Jackson, W. W. Bearpark, Alncliff, Blyth. **GAME BIRDS.**—*Black-breasted and other Reds.*—Cup and 1, W. F. Entwistle. 2, G. Hall, Kendal. 3, G. Bell, Morpeth; 4, W. F. Entwistle. 5, G. Hall; 6, J. Bobson, Bishop Auckland; 7, Miss M. J. Nelson, Cockshaw, Hexham; 8, C. J. Young, Driffield. 9, W. Wardle, South Gosford, Newcastle. *Any other variety.*—1, W. F. Entwistle. 2, D. Hunter, Sunderland. 3, Miss M. J. Nelson; 4, W. F. Entwistle. 5, J. & E. Robinson, Sunderland.

**BANTAMS.**—*Except Game.*—1, H. Beldon. 2, W. & S. Sherwin, Ripon. 3, Rev. J. G. Milner, Hamsterley, Bishop Auckland; 4, E. H. Ashton, Mottam, Manchester. 5, Milner & Beaman, 6, R. Smith, Norton, Malton. **ANY OTHER VARIETY.**—1, Miss Kirk, Givendale, Ripon. 2, J. Young, Driffield. 3, H. Beldon. 4, H. B. Hawkins, Seaham Harbour (Malay); 5, T. P. Carver (Black Hamburgs); 6, H. A. Cava, Sunderland (Silkies); 7, C. Venables, Sheraton, Castle Eden (White Minorcas); 8, W. Grainer, East Boldon, Newcastle (Minorcas).

**ANY VARIETY.**—*Chickens.*—1, E. Pritchard, Wolverhampton (Dark Brahmans). 2, G. H. Procter, Durham (Buff Orpingtons). 3, Blesburn & Maynard, Northallerton (Brown Red Game). 4, J. T. Froud, Binschester, Bishop Auckland (White Dorkings). 5, F. E. Gibson, Middleton-in-Feesdale (Dark Brahmans). 6, T. & G. Kidson, Old Ormsby, Middleton (Golden-pencilled). 7, T. Grey, Greenhead, near Stanhope (Game). 8, J. G. Walker, Heaton, Sunderland (Golden-pencilled). 9, T. Grey (Silver-spangled Hamburgs). **DUCKS.**—*Bouen.*—1, H. Beldon. 2, W. Canney, Bishop Auckland. 3, Miss Scott; 4, J. Young. *Aylesbury.*—1, F. E. Gibson. 2, W. Canney. 3, T. Scott. **COCHINS.**—C. Venables, Sheraton, Castle Eden. **GREEN.**—Cup and 1, C. J. Young. 2, H. Farret, Durham. 3, W. Love, Wokingham.

**JUDGES.**—Mr. E. Hutton.

## OLECKHEATON SHOW OF POULTRY, &c.

This took place on the 24th, and the day proving very fine the gathering was superior, no other society in this locality coming in for such an amount of popular patronage. The pens were constructed of wood, with strands of wire netting stretched in front, which, while substantial, were not such as would facilitate the handling of the birds, the openings being to the back. Money prizes were offered, there being no cups or other extras, but three prizes in each class of poultry, and two in each class of Pigeons and Rabbits.

Game were divided into five classes, and among them were many good birds, but some were sadly out of feather. In single cocks Mr. Brierley won with a capital Brown Red, the second going to a Pile, and third to a Brown Red; but the first requires a little more practice in the show pen. The Pile was a handsome bird. Black Reds were good in quality, but rather faded. Brown Reds being good as regards the winners. Duckwings were smart in style, the hens particularly nice in colour. In the Variety Piles won, and these were very good; first a very fine quality, second very substantial but old, and consequently not as correct in colour, and a little thick; and third a cock, with a very young pullet—an objectionable way of showing. *Dorkings* a grand class, and all Dark Greys. In *Cochins* the winners Buff, very good in colour and quality; the first-prize hen particularly good in shape. Any other variety, nice White and Partridge. *Spanish* were first a most uncommon pen as regards quality; second cock grand, and hen pretty good; the third a good hen, but poor cock; highly commended a better hen, but cock though fine was small in face. The finest three in *Brahmas* were a close run, first by far the best cock, but hen, though good, failing; second best hen, but cock not so well marked and smaller; third, a good pen in colour, but wanting

in finish. The worst feature of the schedule of this Society is the distribution of the prizes in *Hamburgs*, for while Black Hamburgs are provided with a class, Gold and Silver of each kind are classed together, and we would strongly recommend a revision of this section for another show. In *Spaniels* first were Gold, and second Silvers; and in *Pencils* first Silver, and second Gold, the whole being good; while Black Hamburgs were one of the best classes. In *Game Bantams*, Black-breasted Reds, the first were a good old pen; second a small smart cock, with a pullet; and third a rather large good-coloured cock, with a pullet. In the next Piles won all the prizes, and the whole were very good; some capital chickens coming in for the highly commended. In the following class Blacks were the winners; and in the Variety class Gold Polands, Crève-Cœur, and Silver Polands won; and in the Selling class Spanish and Brown Red Game. In chickens, for which one class was provided, some good pens were shown; the first White Cochins, second Light Brahmans, and third Dark; a good pen of Silver Pencils were very highly commended. In *Aylesbury Ducks* were some young birds of this year of great size and purity of quality. The *Bouens* more numerous, and very even, although mostly out of feather; and in the Variety class, which was a most attractive one, a splendid pair of so-called Yellowbills first, Chilian Teal second, and Kasarkas third. *Geese* and *Turkeys* few in number, but very good in quality.

For *Pigeons* there were ten classes. In *Carriers* Duns and Blacks won respectively. The *Pouters* proving one of the best classes in the Show; first a grand Blue cock, second a Blue hen, and highly commended a good Black cock, which was a little lame, however. *Tumblers* poor; and *Fantails* only moderate in quality. *Dragoons* were as usual very good, and the winners Blue, as near perfection as we think it possible to get them. In *Turbits* only the winners were of any note, both of which were Reds. In *Jacobins* Reds also won, both pairs nice in all points. In Long-faced Antwerps only one pair really answered that description, these being Blue Chequers; the second, Red Chequers, were good, but the cock too short in face. Short-faced Antwerps were a grand lot, the competition close, the winners being Silver Duns, and very true to head, eye, and colour properties. In the Selling class Blue Owls were first, and Archangels second.

*Rabbits* were not numerous. In *Lop* bucks the first went to a Black, 21½ by 4½, large, and good in other points; second a Fawn, 20½ by 4½; very highly commended a Tortoiseshell, 21 by 4½, not equal, however, in eye and condition. Does were Fawn and white first, 21½ by 4½; and second 90½ by 4½, young, and nice in bloom. In the following class a Silver-Gray was first and Angora second; and in does first was Silver-Gray and second Himalayan, both very good. During the arbitrations the Secretary himself saw to the feeding of the birds.

**GAME.**—*Any variety.*—Cock—1, C. W. Brierley, Middleton. 2, R. Walker, Gomersall. 3, G. Fearley, Kirkstall. 4, E. Wilson, Black Red. 5, J. Mason, Worcester. 6, R. Hemmingsway, Shelf. 7, J. Crowther, Liversedge. 8, E. Aykroyd, Boscalth. 9, Brown Red. 10, C. W. Brierley. 11, J. W. Thornton, Boscalth. 12, E. Wilson, Boscalth. 13, E. H. O. Mason, Boscalth. 14, E. Aykroyd. *Any other variety.*—1, E. H. O. Mason. 2 and 3, R. Walker. 4, W. J. Mason, Drighlington. **DORKINGS.**—1 and 2, J. Walker. 3, W. H. Crabtree, Levenshulme. 4, J. Newton, Sladen; 5, W. Harvey, Sheffield. **COCHINS.**—*Except Game.*—1, J. Walker, Boscalth. 2, W. Harvey, 3, C. M. Gidwick, Kelghley. 4, W. H. Crabtree. *Any other variety.*—1, W. Whitworth, 2, Longdendale. 3, H. Beldon, Bingley. 4, T. H. Barvick, Farnham. **SPANISH.**—Black—1, H. Beldon. 2, F. Bentley, Bradford. 3, J. Thresh, Bradford. 4, J. Powell, Bradford. **BRAHMA FOOTPATH.**—1, W. H. Crabtree. 2, W. Whitely, Sheffield. 3, U. Holt, Boscalth. 4, W. H. Crabtree. 5, W. Schofield, Birkenshaw; 6, J. Moore, Holmfirth.

**HAMBURGERS.**—*Gold or Silver-pencilled.*—1 and 2, H. Beldon. 3, H. Digby, Lindley. *Black.*—1 and 2, H. Beldon. 3, W. Bentley, Holmfirth. 4, C. M. Gidwick. *Gold and Silver-spangled.*—1, T. Dean, Kelghley. 2 and 3, H. Beldon. **BANTAMS.**—*Game.*—*Black or Brown Red.*—1, W. F. Entwistle, Wyke. 2, R. J. Hartley, Altricham. 3, A. Smith, Norththorpe. 4, S. Sugden, Cleckheaton. 5, W. F. Entwistle. 6, F. Pirch, Heckmondwike. *Any other variety.*—1, W. F. Entwistle. 2, J. Wright, Wibsey. 3, A. Smith. 4, W. F. Entwistle; 5, G. Noble, Dewsbury; 6, J. Naylor, Heckmondwike. *Any variety except Game.*—1 and 2, H. Beldon. 3, Milner & Beaman, 4, H. Beldon. **ANY OTHER VARIETY.**—1 and 2, H. Beldon. 3, W. H. Crabtree. 4, T. Webb, Sutton Coldfield.

**SELLING CLASS.**—1, W. Harvey. 2, J. Thresh. 3, A. Sugden, Swinley. 4, J. Powell. **ANY VARIETY.**—*Chickens.*—1, C. Carr, Wileton. 2, G. Brown, Eamery, Ware. 3, W. Schofield. 4, H. Digby. 5, T. Webb. 6, J. S. Stott, Copley; 7, W. Bentley. **DUCKS.**—*Aylesbury.*—1 and 2, J. Walker, Boscalth. 3, G. Holt, Boscalth. 4, W. Walker. 5, J. Newton. 6, G. Marshall, Dewsbury. 7, J. Walker. 8, H. Beldon; 9, Wharton, Littlethorpe; 10, H. Harrison, Cleckheaton; 11, G. Holt. 12, B. Parkinson. *Any other variety.*—1 and 2, J. Walker. 3 and 4, A. & W. H. Silvester, Sheffield.

**GREEN.**—1, J. White, Whitby. 2, J. Walker. **TURKEYS.**—1, J. Walker. 2, J. H. Rockett, Selby. **PIGEONS.** **QUARRIES.**—1 and 2, W. Harvey, Sheffield. 3, H. Yardley, Birmingham; 4, H. Sykes, Huddersfield; 5, S. Seaton, Leeds. 6, J. G. Arkwright, Holmfirth. **POUTERS.**—1 and 2, W. Harvey. 3, F. Seaton. 4, T. Foster, Bingley; 5, F. Seaton. 6, J. H. Sykes. **FANTAILS.**—1, J. F. Loveridge, Newark. 2, S. Lawson, Preston. 3, J. F. Loveridge; 4, F. Seaton. **DRAGONS.**—1 and 2, R. Woods, Mansfield. 3, H. Yardley; 4, W. Bawhill, Cleckheaton. **TUMBLERS.**—1, H. Yardley. 2, F. **APRIL 29, 1878.]**  
**APRIL 29, 1878.]**—*Long-faced*.—J. Crossland, Wakefield. 2. W. F. Entwistle, Mr. E. Foster, Huddersfield; O. Crossland, Liverpool; E. Monney, Low Moor; T. Foster, Huddersfield. 1. W. F. Entwistle. 2. J. Crossland; 3. A. Brook, Bradford. *var.* W. F. Entwistle. Mr. T. Foster; 4. Crossland; 5. Searcy; 6. Harvey.  
**SELLING CLASS**.—1. J. O. Arkwright, Holmfirth. 2. J. F. Crowther, Miffield. 3. G. M. Barton, Leeds. 4. R. Longbottom, Cleckheaton; 5. Lawson, Preston. 6. W. Smith, Northowram.

#### RABBITS.

**LONG-EARED**.—*Black*.—1. R. Murgatroyd, Bowling. 2. J. M. Mander, Wakefield. 3. A. Atkinson, Huddersfield. 4. L. E. & W. Miller, Bowling. *Do.*—1. A. Atkinson. 2. J. M. Mander.  
**ANY OTHER VARIETY**.—*Black*.—1. J. Hallas, Huddersfield. 2. J. Golder, Bradford. 3. Found & Chapel, Dewsbury Moor (3). 4. G. Turfey, Cleckheaton. *Do.*—1. Found & Chapel. 2. J. Hallas. 3. A. Atkinson; 4. A. Lunn, Huddersfield; 5. Golder. 6. J. Seard, Cleckheaton.

**JUDGES**.—Mr. J. Dixon, Clayton; Mr. E. Hutton, Pudsey.

### GREAT GRIMSBY SHOW OF POULTRY, &c.

THIS was held on the 21st inst. in connection with the Lincolnshire Agricultural Society, and although the classes were not so numerous as last year it was a decided success. On the day of our visit (Friday), the only fine day, it was so crammed with people that it was with the greatest difficulty we were able to see the birds at all. Mr. Teebay judged, and except in one or two instances gave the greatest satisfaction.

In *Dorkings*, ten entries, first was a large and good Dark cock with a nice hen; second a large bird of quality; third were promising chickens. In *Red Game* first went to a grand pen of Black Reds, though full in feather; second moderate Brown Reds; we preferred the fourth pen to this. In the next class first went to neat-headed Duckwings, though not good in colour; second were fair birds of the same colour, but not in such good feather; rest poor. In *Cochins* first went to a fine old pen of Buffs, the cock having a deal of white in his hackle; second *Partridges*, which we would have put ahead, both birds being of rare quality; third contained a grand White hen. In *Brahmas* first went to Darks, the cock a nice bird; second very superior Lights. *Spaniards* were a wretched lot, the only good bird being the first prize hen. In *Spangled Hamburgs* but one pen competed, these being very good Golden. In *Pencils* first contained a richly coloured cock with a grand tail, though small in ear; second not so good as the third, the cock being much too dark, white in the face, and without any lacing in his tail, the hen being poor; third a good hen both in colour and marking, her partner being a very smart young cockerel, good in head and ear, and fair in colour. In *Houdans* first a Dark cock good all round, with a nice hen; second a fine cock in size, but ugly in comb; the hen was very good. In *Orpingtons* the first hen was a beauty, but the cock very squirrel-tailed; second also bad in this respect; third a fine cock, but a bad hen. No. 54 (Cuckoo) a fine cock. In *Polish* first a good pen of Golden, the hen nicely marked, and the cock very neat and rich; second not so good as the third. *Bantams* numbered nine pens, first being a very stylish pen of Black Reds; second fair Duckwings; third Brown Reds. Blacks were first in the next class, but they were nothing extra; second went to Silver Seabrights, the cock a nice bird, but the hen poor. In the Variety class first went to La Flèche of nice quality, but we thought the second Black Hamburgs much more perfect. In the Selling class for single cocks first was a very rich Buff, and in that for pairs of hens good *Spaniards* were victorious and quickly claimed; second were a cheap pair of *Cochins*. In *Geese* Mr. Walker's Toulouse just beat Mr. Derry's fine Embdens. *Ducks* were good, Mr. Walker winning first and second in all three classes, the latter with *Spotted-bills* and *Chilian Pintails*. *Turkeys* and *Guinea Fowls* mustered only one pen each.

*Pigeons* were very few, especially the Carriers. There was a nice pair of *Almonds* first in the Tumbler class, and in the Variety class first went to good Black Barbs; second to fair *Yellows*. The pens were supplied by Mr. Turner of Sheffield, and the whole management was entrusted to George Haliwell, everything going off satisfactorily.

**BONNIES**.—1 and 4, J. Walker, Spring Mount Road, Leeds. 2, W. Roe, Newark. 3, W. H. Robson, Beepham, Lincoln.  
**GAULS**.—Red or any other dark colour. 2, W. G. Waters, Blaham, Brigg; C. Chaloner, Whitby; 3, C. Chaloner, 4, H. E. Martin, 5, J. B. Selby, 6, J. B. Selby, 7, J. B. Selby, 8, J. B. Selby, 9, J. B. Selby, 10, J. B. Selby.  
**DOMESTIC**.—1, S. B. Beighton, Farusfield. 2, W. G. Waters, Blaham. 3, J. B. Selby, 4, J. B. Selby, 5, J. B. Selby, 6, J. B. Selby, 7, J. B. Selby, 8, J. B. Selby, 9, J. B. Selby, 10, J. B. Selby.  
**COCHINS**.—1, J. Walker. 2, Mrs. A. Tindal, Aylesbury. 3, W. Whitworth, jun., Longlight.  
**SPANISH**.—1, W. H. Crabtree, Levenshulme. 2, Mrs. Tindal. 3, J. Wells, Winterton, Brigg.  
**BRAMBLING**.—1, R. Newbitt, Epworth. 2, W. G. Waters. 3, E. Bennett, jun., Grimsby.  
**HAMBURGERS**.—*Spangled*.—1, J. Long, Bromley Common. *Pencilled*.—2, R. Newbitt, Epworth. 3, Smith & Taylor, Lincoln.  
**FARROWING**.—*Houdans*.—1, G. W. Hibbert, Godley. 2, W. Whitworth, jun. 3, R. Coney, Alford. *Crepe-Cour*.—1, W. H. Crabtree, 2, G. W. Hibbert, 3, Mrs. R. Green, Brigg.  
**POLANDS**.—1 and 2, A. & W. H. Silvester, Sheffield. 3, G. W. Boothby, Louth.  
**BANTAMS**.—*Game*.—1, G. W. Waters, Blaham. 2 and 3, W. G. Waters. *Any other variety*.—1, W. G. Waters. 2, A. & W. H. Silvester. 3, J. A. Dakin, Mottam, Manchester.  
**ANY OTHER VARIETY**.—1, Mrs. A. Tindal. 2, J. Long.  
**SELLING CLASS**.—*Cock*.—1, Smith & Taylor, Lincoln. 2, W. Wright. 3, W. Roe. 4, W. Whitworth, jun. *Hens*.—1, R. Newbitt. 2, Taylor & Smith. 3, Mrs. A. Taylor. 4, Simpson & Donat, Bedale.  
**SELLING CLASS**.—1, R. Newbitt. 2, J. Walker. 3, G. W. Boothby. 4, Mrs. Spencer, Howham, Brigg. 5, W. Bygott.

**GREENS**.—1, J. Walker. 2, T. M. Derry, Gedney, Wisbeach. 3, W. G. Waters, Boston. 4, J. Walker. 5, J. Walker. 6, Mrs. A. Tindal, Boston. 7 and 8, J. Walker. 9, W. Bygott, Ulesby Junction. *Any other variety*.—1 and 2, J. Walker. 3, A. & W. H. Silvester.  
**TURKEYS**.—1, J. Walker.  
**GUINEA FOWLS**.—1, K. Small, Barrowden.

#### PIGIONS.

**CARRIERS**.—1, J. James, Bath. 2, F. Hodgson, Driffield.  
**FOURERS**.—1, H. Yardley, Birmingham. 2, A. Spencer, Driffield.  
**TUMBLERS**.—1 and 2, A. & W. H. Silvester.  
**ANY OTHER VARIETY**.—1, H. Yardley. 2, C. Woot, Hall.

### CRYSTAL PALACE GOAT SHOW.

THIS was held on the 24th inst. The following were the awards:—

**SHORT-HAIRED**.—*Male*.—1, F. Wood. 2, A. Hunt. 3, O. Bartlett. *Female*.—1, J. Maher. 2, T. Green. 3, Extra. 4, E. Evans. 5, G. Vincent. 6, Extra. 7, F. Wood. 8, J. Maher. 9, J. Maher. 10, J. Maher. 11, J. Maher. 12, J. Maher. 13, J. Maher. 14, J. Maher. 15, J. Maher. 16, J. Maher. 17, J. Maher. 18, J. Maher. 19, J. Maher. 20, J. Maher. 21, J. Maher. 22, J. Maher. 23, J. Maher. 24, J. Maher. 25, J. Maher. 26, J. Maher. 27, J. Maher. 28, J. Maher. 29, J. Maher. 30, J. Maher. 31, J. Maher. 32, J. Maher. 33, J. Maher. 34, J. Maher. 35, J. Maher. 36, J. Maher. 37, J. Maher. 38, J. ### DARI.

DARI is frequently advertised in the Liverpool papers, and I have often seen and heard it well spoken of as calculated to promote laying in fowls. My own experience of it is

Bantams of all ages and all breeds competed in one class for a 15s. prize, and we were fairly amazed to see fourteen entries of such good birds. Of course Sebrights were first; oh! how jealous other Bantams must be of the late Sir John's manufactures, for they always have the cup, and always win the prizes in the Variety class, and yet when they have a class to themselves their owners lose courage and keep them at home; vide Croydon, Dorchester, and elsewhere.

In Variety class Polands first, and good Black Hamburgs second; and third going to what once we saw at a show (Southampton) with the title of "Gangesians."

Geese and Ducks mustered well, and the quality was good. The fancy Ducks were beautiful, but we grieve to say we fear these very ornamental and lovely little pets are driving the useful and excellent-eating Muscovies, East Indian, Call, and Wild Ducks out of the region of poultry shows.

### RABBITS AT BRAMLEY.

Your reporter says, "In this section [of the above Show] we, however, noticed some rough handling of the Rabbits by a reporter, against which we at once enter our protest." As a breeder and fancier of thirty-five years standing I must say I quite agree with the above remarks, but am prepared to be opposed by some individuals who are frequently judging Rabbits and reporting their own awards!

On my entering the tent at the Bramley Show my attention was drawn to the Rabbit section, when I was sorry to notice a man with a very heavy walking-stick molesting and roughly poking a Silver-Gray belonging to Miss Mortimer, and more surprised on learning the name of this Rabbit-poker, who also possessed a Rabbit in the same class. This treatment I was also told had been going on at continuous intervals during the whole of the morning. A contemporary remarks on the same Rabbit as follows:—"Miss Mortimer's buck took second, and did not look well owing to its very long journey and confinement in its box." But I feel more inclined to think that the stick-poking had more injured its looks than the long journey.

I will add that reporters should be admitted before the general public, that they may have time to well examine the specimens, and more especially to see what specimens are really there to be judged and what come "late." I think judges would be thankful for this.—S. G. HUDSON.

### GUINEA FOWL HATCHING.

As I wrote to you a week or two ago about my Guinea Fowls' eggs not hatching, I may as well mention that I let the hen Guinea Fowl sit. As she had laid so many eggs I was afraid she might lay more and die if I took her off, and much to my surprise she hatched fifteen young birds! Two died in coming out, two eggs were addled, and there was only one blind one out of the twenty she sat upon. Anything worse than the way she sat cannot well be imagined, as she began by sitting in the day and roosting at night. She then came off constantly for two hours at a time, frequently twice a-day, and it is only the last ten days that she sat really close. I never had a Guinea Fowl hatch her young before, as they invariably ceased sitting at the end of a week or so, and am rather puzzled how to manage. The cock at first pecked the young birds, but seems to have taken to them now, so I am leaving him with them as the hen will not stay quiet without him. They were hatched on the 16th.—PUZZLED.

[It is not an uncommon thing for a Guinea Fowl to hatch her young. That they do not do so always is to be attributed to the fact that they are not good sitters. Three or four will lay in the same nest. The writer of this once found a nest in a patch of furze quite half a mile from any house. It had sixty (60) eggs in it. More liberties may be taken with their eggs than with most others on account of the great thickness of the shell. As it is the opinion of most practical people that Guinea Fowls pair, we should not hesitate to leave the cock with them. Monogamous birds are seldom harsh to their young.]

### JACOBIANS.

I AM always specially glad to see an article on Pigeons written by an intelligent fancier who can look back a good many years, because the fancy is an historical thing, not an affair of the last few years. Hence, therefore, I was glad to see the article on Jacobins in our number for July 15th, by the veteran fancier of Dundee, Mr. Ure.

I agree with him in some things, and differ from him in others. I agree with him in regard to what Jacobins were as far as I can remember, looking back for about thirty-five years, when as a young boy I entered the fancy, and just now Jacobins are especially interesting to me, as I am breeding, watching, and experimenting with that variety of Pigeon. First, the old class of Jacobins had not a stumpy Baldhead look, but had long

flights and tails, and were narrower in the shoulders. Second, I think the soft silky texture of the feathers of which Mr. Ure speaks, and which I remember well (having so often petted and stroked the down-like feathers of the hood and chain), was chiefly found in birds that were of a light mottled colour. Perhaps this was because so many of the feathers were white. I saw one such bird a dozen years ago in a dealer's shop, and bought it at once, but, alas! though a very gem, he was too old to propagate his species. I had, I may observe, saved up one hen as good with which I paired him. I never can see why the mottled birds have been discarded, for they were unique in colour, and from the lightest could be bred whites with pearl eyes. The softness of feathers is not seen in the reds, the commonest colour, but to my mind the least pretty of any. The old fanciers always preferred the yellows. I agree, too, with what Mr. Ure says upon the hoods being further back now than they used to be, but I have seen some recently which had not this fault. I think more of the eye of the Jacobin being a clear pearl than apparently does Mr. Ure. A bull eye to my mind spoils the head, but one eye in old days, as now, very frequently came of that objectionable colour, no doubt arising from the white head.

In regard to the mane, there I differ utterly from Mr. Ure, holding it to be a very great beauty. But the difficulty I find in getting the beak short. Oh, for a good short face in addition to other beauties! then you see a face which gives a fancier pleasure to look at, and with it usually goes that fall in the back which is seen in a good Jacobin. I take, therefore, and endorse the points mentioned by Mr. Ure, "fine head, hood, and chain, thin shoulders and length and silkiness of feather," and add, "pearl eye, good mane, and the Jacobin carriage." The bird has nothing to do with the Baldhead Tumbler, and I want him as unlike that bird as possible.

The Jacobin is a particularly ornamental Pigeon, and is seen most to advantage when having its free flight about a house quite in the country. See a number of various colours promenading on the gravel walks and peeping about the front porch, posing themselves now and then as if for admiration, then flying a few yards and alighting near you, not being birds of much flying powers, and they make admirable ornaments around a house, and the beauty of them is that the better bred they are the more ornamental they are in the estimation of every looker-on. The larger the hood and chain the prettier they look, the smaller the head the neater they look, and so on even to a non-fancier's eye. But I want the silky plumage Mr. Ure speaks of, which when a bird lives at large in the perfectly pure air of the country home adds so much to its beauty, and the long flights and tail. In short, just what a Baldhead should be, a Jacobin should not be.—WILTSHER RECTOR.

### A BEE-KEEPER'S DIARY.

LAST December you inserted an account of my first attempt to save bees from the burning. In September I rescued and fed-up in empty hives altogether twenty-three condemned colonies. All were made snug for the winter months in nine hives, making with two hives which I had before eleven stocks to stand over for this spring. I promised to send to you an account of my success or failure in trying to make the most of them this summer. For the purpose I have kept a diary of my proceedings.

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
○	○	○	○	○	○	○	○	○	○	○	○	○	○	○	○	○

Position of apiary under a south hedge, with 8-feet walk between it and the back of the hives. Entrances all facing due N., but all provided with plugs which can be used to narrow the doorway to any size required.

1. Three swarms united September 8th, 1874, from garden. No. 8 in 14-inch hive.
- 2, 3, 4, 5. Nine swarms from cottager's garden. No. 2, September 2nd, 1874, in 14-inch hives.
6. Three swarms united, September 8th, 1874, from garden. No. 3, in 14-inch hive.
- 8, 10, 14. Six swarms from garden. No. 1, August 28th, 1874. Removed from under a walnut tree facing S. February 18th, 1875. One hive found dead, foul brood, formerly four hives, with two swarms in each.
12. Swarm of 1874, from stock purchased March, 1873. Removed from under walnut tree, February 18th, 1875.
16. Bar-frame hive tenanted with artificial swarm, May 26th, 1875.
7. Swarm from No. 4, in 18-inch hive. June 6th, 1875.
9. Splendid cast from 14, placed in 18-inch hive, June 8th, 1875.
11. Artificial swarm and bees driven from an old swarmed stock, joined and placed in 30-inch hive, June 14th.
13. Old stock from which artificial swarm was driven June 14th. Entrance stopped and opened June 17th.
17. Two heavy swarms bought of villager, united in 30-inch hive May 28th, 1875.

The above will at once show the position of the hives and the origin of their occupants as my apiary now stands. In the following notes the hives are referred to by their numbers.

† Bar-frame hives.

\* Unoccupied post.

DIARY FOR 1875.

February 10th.—No. 5 found perished, dysentery; 2 and 3 very weak.

March 1st.—Took 2 and 3 into greenhouse. The warmth set them moving. Fed with syrup. Weather miserably cold. Snow on the ground.

April 1st.—No. 2, all dead } Dysentery in both cases. Plenty  
April 7th.—No. 3, all dead } of sealed food in both hives. Ob-  
tained lots of clean guide combs. Fed all hives gently.

May 4th.—Placed 20-inch hive under No. 8. Stopped entrance to top hive. Bees very quiet.

May 5th.—No. 8 doing well and working combs into nadir. 1, 4, 6, 14 growing very strong. 12 seems weak but healthy. Fruit blossoms fully out. The various kinds of willow have supplied abundance of pollen during the past month, but weather so cold that the bees can seldom seek it, often dying in the attempt, being frozen by the cold E wind. Have discontinued feeding with syrup, finding barleysugar a cleaner and more gentle substitute. I give it over the centre opening, placing a flower-pan inverted above it.

May 18th.—No. 1, filled a flower saucer with combs and partly with honey. Cut off the saucer and placed super with guide combs. May 20th.—Bees in No. 1 commence in super.

May 24th.—Placed 20-inch hive under No. 6. Bees instantly took to it.

May 25th.—Drove an artificial swarm from No. 4 into a 6s. 6d. Abbott bar-frame hive. Placed it on No. 18, and the stock returned to its own stand, the number of bees left in it being small. Two outer combs fell, from which I obtained 5 lbs. of pure fruit-blossom honey.

May 26th.—Took a strong artificial swarm from No. 10, and with it tenanted a bar-frame hive. Placed the swarm on No. 10, and removed the stock to No. 8, having closed the entrance. 4, 6, and 16 doing well.

May 28th.—Shook out two swarms of to-day bought of villager into 20-inch hive. No fighting. Placed on No. 17 and fed. Fed all new swarms with syrup.

May 31st.—Natural swarms from 8 and 1 placed on 12 and 14 in 18-inch hives, and the stocks 12 and 14 removed to 2 and 5 respectively.

June 3rd.—Placed super on No. 4. Great cluster outside No. 8 all night. Weather very sultry.

June 4th.—Placed supers on 5 and 14.

June 6th.—Heavy swarm while at church from 4. Hived at 4 p.m. into 18-inch hive and placed on 7. Continue to feed all new swarms at night and on cloudy or wet days.

June 7th.—No. 14 very strong. Bees hanging out.

June 8th.—Cast from 14 very heavy, but as heavy a mass of bees left in the hive. (There was a good peck of bees put into 14.) Placed in 18-inch and on No. 9 stand.

June 10th-14th.—Very wet and cold. Fed all swarms.

June 14th.—Afternoon finer. Bought two old stocks. Drove bees from one entirely which had sent out a swarm a few days before. Also drove a heavy swarm from the other stock. Joined both these at evening in 18-inch hive, and put them on stand No. 11. Placed the empty stock with lots of brood in it over No. 3. Removed the other stock in evening, closed the entrance, and placed it on No. 18. The super had been removed from No. 1 when it swarmed. Bell-glass placed over No. 1 to-day, and bees took to it.

June 15th.—Gave water through the hole in the top of No. 18, which I cut and covered with perforated zinc last evening.

June 17th.—Opened entrance to No. 18. Bees work in and out well, none returned to their old stand, about 200 yards from my garden. Clover in flower 100 yards distance.

June 19th.—Very heavy swarm from No. 5. Super deserted with two nice combs in it. Joined this swarm to No. 12, which appeared weak. Bean field in flower very near to which the bees work. Clover out to-day.

June 19th-24th.—Bees working well, no more symptoms of swarming. Placed small ball-glass over 8.

June 24th-30th.—Great change in the weather. Stormy and cloudy. Bees cannot get out at all day after day. This being the best season for honey-storing, the "look-out" is a bad one, a small harvest is probable. Drones killed off in several hives.

July 1st.—Rain the whole day.

July 2nd.—Showery. Bees go out but little. Gave a small quantity of syrup to four lightest hives.

July 3rd and 4th.—Weather very bad both for bees and hay. N.B.—I have lately noticed white grubs being dragged from the hives and pitched over the floor-board. They are doubtless being killed off to lessen the hungry population.

July 5th-8th.—E. wind, cold but a little finer. Bees go out a little for honey from the limes. A splendid avenue of these glorious trees now in full blossom, and the mellifluous treasure being washed away by the rains. Drones are lying dead in numbers around the hives.

July 9th.—Wind W. Heavy rains again. Not a bee out.

July 10th and 11th.—Very showery. Many bees tempted out and drowned.

July 12th.—Fine and warm. Bees crowding out, but the flowers all too drenched to be worked upon.

July 13th-15th.—From 11 a.m. on the 13th until 10 a.m. on the 15th an incessant pour-down of rain from S.S.E.

July 16th.—Cloudy and showers. The bees must be fast consuming what little honey they have stored in the spring.

July 17th.—Torrents of rain from N.E.

July 18th.—Fog until 11 a.m., then sultry and sunny. Bees working with all their might. The glasses of supers which had been deserted again full of bees. This I fear is but a break between storms. Every indication of rain again from the west.

July 19th.—Torrents of rain again from S.S.W. The season is now so far advanced for this neighbourhood that I must expect no honey this year, but that I must feed them all in autumn. From June 24th to present date the bees have not had but two days for working, and so I send my diary up to this date, as I am going from home for some time. In late autumn I hope to tell you the results of my examination of the hives, and the number of stocks I rescue.—P. H. P., *Offley, Hitchin.*

# MANCHESTER HONEY SHOW FOR 1875 ABANDONED.

OWING to the long-continued unfavourable weather for bees in this locality, the Committee of the proposed Show have thought that an exhibition worthy of the name, or of the expense and trouble necessary, could not be secured this year, and therefore have decided not to have one. Some disappointment will be felt by those who have been at some expense in preparing for a competition. More disappointment would probably have been felt if we were to beg and spend £50 and produce little for it. Yet, having an Exhibition at Manchester this year has been abandoned with reluctance.—A. PARTIGRAW.

## QUEEN BEES FROM EGGS.

SEEMING that the question as to whether bees have the power to raise queens from the eggs which produce ordinary workers is still a debateable one, the following facts which have recently occurred in the north of England may help to throw some light on the matter. The hives of the Rev. E. Brierley of Great Broughton, Cumberland, are upon the bar-and-frame principle, so that any given comb can be removed at will. The glass super of No. 8 hive was found deserted of bees on July 7th, and the super and the cover of the stock hive underneath were removed, when it was seen that the hive was in the reverse of a prosperous state. A minute examination of every comb showed that there was no trace of eggs, grubs, or sealed brood, and it was clear that the hive was going down. A comb full of eggs only was at once selected from another stock, marked, and dropped into hive No. 8. The queen bee happened to be on the selected frame, whence she was removed and the remaining bees brushed off. The comb was new, but all the space in the frame was not filled with comb. On July 14th the cover was again raised, when a great difference was observable in the manner of the bees, and on taking out the marked comb the experimenter was rewarded by finding five of the so-well-known queen cells, three of which were already sealed. A portion of the empty space in the frame had been filled with drone comb.—B.

## OUR LETTER BOX.

BRAMLEY SHOW (*J. North and Others*).—No more need be said upon the subject of the rough handling of the Rabbits. The conduct was very wrong, but we need say no more than that the names of the delinquents surprise us.

TUMOUR IN HEN'S BREAST (*A Constant Reader*).—Open it with a sharp knife or pointed scissors, squeeze out the contents, cover the opening with diacylon plaster, and leave the cure to Nature. A bruise may have caused it. Your half-round perches are good, but no perches should be more than 2 or 3 feet from the floor, and this should be covered with sand 2 inches deep.

HOUDANS UNHEALTHY (*E. J. P.*).—We rather hesitate how to advise you. We look with affection on Houdans wherever they can have a good run on their owner's property. We cannot explain it, but we know it is a fact, that if in their run there are ten square yards out of a hundred acres that do not belong to their legitimate owner, that is where they will, if possible, lay their eggs. Our next complaint against them is, that in confinement they eat each other's feathers—truly a foolish habit. Jingle lived a long time on a coat and a pair of boots (had polley to pawn the pair), he should have pawned one, and accounted for his un-brootal appearance by saying the other was gone round the corner to have "a brad or two put in." In like manner we read in shipwrecks of a boat's crew nourished by a pair of Wellingtons. This, however, is sheer necessity. Your fowls have nothing of the sort. Judging from the bill of fare you send, it is not for want they eat their feathers. Nevertheless, we would suggest a change. Let the whole grain be given at midday, and the ground oats in the evening. We do not find they are at all particular as to soil. We find them good layers, hardy birds, and excellent for the table. We have scores of them; their feet are not swollen. What is the flooring of their house? It is likely you may there find the cause of the swelling. If the floor is anything but earth, that is the cause. We use no patent foods, we would not if they were given to us. So far as we can follow "Nature's cookery book," "what to eat, drink, and avoid to reach a healthy old age." We seldom fail, no artificial heat, no spiced foods, no laying powders, but good honest wholesome food. You will be troubled to find a better fowl than the dark Brahms, but the Houdan is a good one.

**POULTRY MORTALITY (R. H. J.).**—It is safe to say that weather has much to answer for where deaths are frequent in the poultry-yard. The total absence of sun, cold nights, and continued rains have done much to interfere with the comfort and well-doing of poultry, both chickens and adults. The cold wet surface of the earth, the lack of heat and dust, the impossibility of scratching in 3 inches of mud, and the necessity of running every half-hour of the day to avoid a shower that converts an inequality of the surface into a pool, is a tax on chickens. They cannot grow, and where they do not grow they are not in health. The same causes operate against the health of the adults. We presume the different sorts of poultry have different roosting places. It is most difficult to keep health in a house where Turkeys, Guinea Fowls, and Ducks inhabit with them. Fowls should lodge by themselves. We do not think your feeding as good as it might be. We dislike rice and cabbage. We also infinitely prefer any natural food to all the prepared and patent foods. With good corn, ground oats, barleymeal, lettuce leaves, and kitchen scraps or table sweepings, you have all that is necessary for food, and if they have in addition a good grass run they have all that is necessary for health. Much experience has taught us that great variations of temperature and a wet season induce disease of the liver. The appearances you mention are much more common in Rabbits than in fowls. In the latter it is found in old birds, and in those that have been fed on stimulating food to make them lay, than in any others. Dropsy is a very common disorder in these cases, and a hen unnaturally treated with stimulants seldom lives more than two years. Those that have been naturally treated and have lived and laid six or seven years are almost always found to have more or less of dropsy in their systems. We have taken half a pint of water out of one hen. We advise you to let the fowls roost by themselves. To feed in the morning with ground oats slaked with water, midday with whole corn and scraps, evening with ground oats slaked with water, to supply lettuce when you have it, is good and healthy feeding, and properly managed as cheap as anything you can buy.

**LOBBY BRAHMAS (W. W.).**—They should be white with the exception of tails, hocks, and thighs—these should be black. They should have pen-combs, well-feathered legs, no vulture hocks. They should have yellow legs. They cannot be too large if they are well shaped. Clean legs, mixed plumage, dark legs and loose combs, are all disqualifications.

**COLOUR OF YOLKS—GAYES (L. R. L., jun.).**—As a rule the yolks of pullets' eggs are paler than those of hens. It is also said those laid in cold weather show less colour than those laid when it is warmer. We believe the remedy will be to keep the hens till they are older. There is only one cure for gapes, and that is to give camphor. It may be given in their water if sufficient is put in to make it into camphor jelly, or in urgent cases a pill the size of a garden pea may be given. Bran is worthless poultry feeding. Give your fowls soft food, barleymeal or ground oats slaked in the morning, the same in the evening. At midday you may give whole corn and household scraps; green meat whenever you can, especially lettuce, and sods of grass.

**COCHIN-CHINA COCK DROPPING (W. O. S. S.).**—There is no consumptive disease among fowls, but there is "atrophy." In such cases there is no discharge from the nostrils, no short cough, no rattling in the throat. The bird diminishes in size and weight daily, it shrivels up, the skin of the face is stretched on the bones, and the same may be said of the skin of the legs. The body is a skeleton covered with a dried, red, and parished skin. We have known but one instance of recovery from it. In that case a Spanish hen took a fresh lease after drinking three bottles of old port and eating French rolls by the dozen. Dissection generally shows the lungs adhere to the bones and are dried up.

**CHICKENS JUST HATCHED (W. E. S.).**—When our chickens are hatched we leave them under the hen for eighteen hours in cold weather, and nearly as long in warm. We then feed the hen sumptuously, and put her in a spot entirely sheltered, with the chickens under her. The food is bread and beer, bread and milk, and chopped eggs. They soon take to it, and never die of cold. Your chickens die of gapes, and you might as well give nothing as cayenne. The only cure is camphor; either a small piece given as a pill, or water strongly impregnated with it given to drink. The hen would not allow the chick to roost under her. We should observe we never allow the hens their liberty till they begin to lay again.

**BRAHMAS (W. O. M.).**—We should advise you to renew one-third of your fowls every year. The adults will continue good layers for three years. The purchased pullets will be the winter egg-providers. Although a Brahma is not worn out at three years old, yet there are always some that from accident or otherwise are neither pleasant or profitable objects. Such should go to the kitchen to make room for the chickens every year. Your feeding will be improved, and also be more economical, if you give ground food slaked with water morning and evening, and scraps or Indian corn mid-day.

**PUTTING ON SUPERS—OBTAINING CLEAN COMBS (F. J.).**—You may put supers on hives before they are full, and let the bees use them when they need them. For several reasons we do not put supers on till the bees require more room, till there is a likelihood of the bees entering them at once and commencing work. Properly made hives are not usually cemented to their boards during the summer months, and even if they were you would find that an examination of your hives now and again would not interfere with their prosperity. Every bee-farmer should know the internal condition of his hives, and he cannot know this without examination carefully made. You ask "if there is any way of obtaining clean comb for fixing in supers except by using the American slinger." We are not aware that the slinger ever has been or can be used for this purpose. Clean white combs filled with honey are too brittle and easily broken for the machine. Better place such combs in supers unbroken, even with the honey in them, than have them bruised and broken by the slinger. Hives that have been filled recently with combs supply us with an abundance of pure white virgin comb for supers, and we know of no other source of supply than hives of young combs.

**BULLFINCH SHOUT OF FRATERNITY (Lady Sybille).**—You may not expect to find the feathers growing upon the Bullfinch's head until it undergoes a moult, which will shortly take place, when Nature will provide the bird with the clothing necessary for the coming cold season. Care birds are fast falling into moult, and no doubt your Bullfinch will likewise. We will not recommend just now any external application, for it will only tend to render the respiratory organ more difficult. We are not so much surprised at the deficiency of the feathers about the head as in the wings and tail, and we think upon close examination you may perceive that there are the old stamps still remaining in, which may account for the non-appearance of feathers. According to the order of Nature, when a bird loses a feather another one should supply its place, more especially in the wings and tail, falling which a bird's system cannot be in a thoroughly healthy state. In old birds the feathers are longer shooting forth than in young birds. Happy bird! It is provided

with all the necessary creature comforts for sustaining and prolonging life. In the way of diet we are sure nothing more need be supplied. If you have been in the habit of feeding the bird freely upon lamb's tongues, partly discontinued it, for the flesh would tend more than any other diet to bring about a deficiency of feathers, and produce a heated system. In the way of medicine you may administer one drop of castor oil. Carefully and tenderly open the bird's bill and deposit upon the back part of its tongue the oil. During the moulting sickness keep the bird free from draught. Discontinue the salfron, and in its place supply a rusty nail in the water. Let Master Bullfinch continue to enjoy his morning's ablution.

**CHERRY WINE (Mrs. Porter).**—To make five pints of this wine take 15 lbs. of cherries, 2 lbs. of currants, and bruise them together; mix with them two-thirds of the kernels, and put the whole (the cherries, currants, and kernels) into a barrel, with a quarter of a pound of sugar to every pint of juice. The barrel must be quite full. Cover the barrel with vine leaves, with sand above them, and let it stand till it has done working, which will be in about three weeks; then stop it with a bung, and in two months' time it may be bottled.

**SHAKES PECKING (St. M.).**—It is picked precisely in the same way as cantharides. The white fungus which occurs on the surface of pickles is prevented by pouring melted suet on the surface of the vinegar in the jar; a film of melted suet the sixteenth-of-an-inch thick is sufficient.

## REMARKS.

31st.—Rather dull morning, shower in the forepart of the day, finer towards the afternoon, and bright sunset.

32nd.—Showery in the morning, fine afternoon, but looking very stormy after 7 A.M., and very early dark.

33rd.—Showery, but cleared at 10 A.M., and continued fine till 4 P.M., except a sprinkle about 1 P.M.

34th.—Rain at 8 A.M., fine by 9 A.M., and a very pleasant day, though looking stormy occasionally.

35th.—Slight showers at times, but a very pleasant day on the whole; cold in the evening.

36th.—Beautiful day throughout.

37th.—Another very fine day, and without any appearance of rain or storm.

A dry fine week, with steadily rising barometer; temperature in early morning of 35th quite chilly.—G. J. SYMONS.

## COVENT GARDEN MARKET.—JULY 28.

THE improvement in the weather has somewhat raised our hopes for the late portion of the crops of soft fruit that may yet remain. The greater portion, however, is irretrievably gone, and large quantities of Latanas and other common Pears come to hand all scored as though done with a knife. Importations have largely increased since the bad weather set in, consisting chiefly of Apricots, Greengages, and Pears. In addition to the West Indian Pines some have recently come over again from St. Michael's.

From observations taken near London during forty-three years, the average day temperature of the week is 74.6°; and its night temperature 51.8°.

## THOUGHTS SUGGESTED BY THE GREAT SHOW AT SOUTH KENSINGTON.

**F**IRST of all I think it a pity that a show so grand was not seen by all the flower and fruit-loving inhabitants of Britain. I think also that had the weather been fine that the attendance would not have been satisfactory. The public have so often been summoned to see great shows and have been disappointed, that nothing less than an actual grand display could reassure them that the hands of the British horticulturist had not lost their cunning. This proof is provided, and the next great show—weather being favourable—will command public patronage; that the late Show could do so was not reasonably to be expected.

But why was the Show so truly great, and how are similar displays to be provided in the future? The natural reply to the first part of the question is, Because horticulturists have confidence in the present Council, and because the leading nurserymen vied with each other in friendly rivalry in bringing forward the richest and the best of their treasures. All honour to them for that, but in my opinion it only half answers the question—to complete it we must remember that they had full freedom. They were tied to neither numbers nor classes of plants. The fullest latitude was afforded them to set off to the best advantage their many plants, which were interesting, not from size and symmetry alone, but for rarity and intrinsic beauty.

Now, it is clear that if the Exhibition had been arranged on the orthodox plan of classes, hundreds of plants exhibited would not have been seen, and some which were would not have been nearly so imposing as was the case on the memorable 21st of July. No class could be framed to have embraced, I may almost say, hundreds of plants which the Messrs. Veitch exhibited. The noble tree Ferns of Mr. Williams and stately Palms of Mr. Bull could not realise the same good effect if grouped in rigid formality. The Ivies from Mr. Turner never looked so well before as under the free arrangement and association with other plants. Messrs. Wills, Lee, Rollisson, Aldous, Henderson, Carter & Co., Outbush, &c., exhibited to infinitely greater advantage in their own way than they could have done in any way carved out for them by others; and the firms, the Society, and the public were alike the gainers. Can it be wise to ignore or to forget this?

But are classes to be abolished? By no means, but they should be supplemented. Many are the plants which will not fit in a class of a restricted number. The mere size of plant required is fatal to their appearance, yet it is beyond question that medium-sized and even small plants are not only beautiful, but to a majority of visitors are as interesting as the large specimens. For these specimens there must be classes, but after these are filled sufficient plants are left for the arrangement of groups which would form a splendid feature in any ex-

hibition, and, besides, would convey instructive hints as to the best mode of arrangement.

The occupation of space in the most effective manner has been well demonstrated at many local shows. For instance, had the collections been removed from the tent at Richmond the Show would have been shorn of its glory; and suppose the plants on the 21st had been selected and broken up into groups of sixes, twelves, and twenties, where would the Exhibition have been? It would have been good, no doubt, but not half as good as was the display which was founded on freedom of taste.

Is it not reasonable that the instruction on this point which the late Show has afforded should be utilised? Would it not be wise to apportion a given amount of space, and leave the exhibitors to occupy it as they choose with large plants or small, few plants or many? If it would be wise to do so, would it not be wise also to do it well—that is, to offer large prizes, and so place the space classes at the least on a level with the specimen classes? Surely 100 square yards of space ornamentally occupied by rare and valuable plants is as worthy of reward as are twelve specimen plants, good as they may be. Would not the adoption of a system of making space and liberty the main governing principles instead of mere number of plants, do something to break-up or, at any rate, modify the stereotyped sameness of our fashionable exhibitions? Would it not be possible also to apportion the space so that not only the owners of large plants and large structures could contribute creditable collections, but which would open the door to those of smaller means who have now little or no chance of letting the public see how good, if small, their plants are; and if that could be done, would it not be worth the doing?

This great Show has proved that at least half a dozen exhibitors can each occupy 100 square yards of space (Messrs. Veitch and Mr. Williams probably occupied together nearly 400 yards); is that not a sufficient basis on which to found serious inquiry? An equal number could occupy half that amount of superficial area, and a further class of exhibitors could worthily fill 20 square yards. Here is the basis of a show as great as the last one proved itself to be. Add to this a judicious selection of classes for specimen plants, and are not the means provided for a larger show than has yet been seen?—a show great and diversified, comprehensive and inviting the greatest number of cultivators, and producing a display suited for various tastes and eminently instructive in the different phases of arrangement which it would call forth.

In any such arrangement it seems to be necessary to bear in mind the advisability of substantial prizes or awards of honours, and an understanding that the same exhibitor could not secure prizes in the different space sections. But on this point there is too much honour in the trade to prevent the fat kine from essaying the swallowing of the lean. Some plan is required whereby all can have a chance to compete honourably to themselves, and the united efforts of the greatest numbers of exhibitors might culminate in displays which for extent

and variety of interest have never been surpassed in this or any other country.

Was not the richly-embellished marquee at South Kensington deficient in one feature—hanging baskets? For these it is admirably adapted. Surely they are worthy of encouragement, and certainly they would have greatly contributed to the effect of the Exhibition.—W.

### ABOUT PEARS.

I AM pleased to see that the idea of obtaining local information about Pears appears necessary and practicable to Mr. Luckhurst and others who have written and talked to me on the subject. If anything is to be done this season it must be done quickly. I would therefore ask all who have any suggestions to make to be kind enough to make them at once, or their help and perhaps the season may be lost; and for once, with the editors' permission, as I am anxious that all who can contribute should do so, I invite anyone who has suggestions to make on this particular subject, and objects to have his letter published, to communicate with me privately. Of course I cannot undertake to answer all such letters separately and privately, but I would gladly make use of any practical suggestions they might contain to further the object I have at heart. I would, of course, much rather all communications were sent to the editors for publication, as that would tend to awaken an interest in the subject; but I know from experience that there are people abounding with stores of knowledge, and yet from timidity or inability to value that knowledge cannot be persuaded to publish it for the good of others. Those who have nothing to say are generally fast enough in saying that nothing, but now and then by accident we come across a veritable living cyclopædia, and wonder how it is that he should have so long remained a closed book.

I have here a letter from a gentleman in Yorkshire on the above subject, who is evidently a great enthusiast and could communicate valuable information to your readers, and as the letter is so much to the point I take the liberty to extract the following. He says, "I shall have great pleasure in giving my experience about Pears. I have cultivated here about sixty varieties for many years, and more than a hundred varieties have been tested here. I greatly approve of your tabulated form, and would suggest two other columns, one headed Bearing Properties, the other Weight of Fruit. We all have letter-weighing machines and can easily weigh our best fruit of each variety, and then it would be seen what success we could arrive at in each case. Nearly all my Pear trees—more than eighty in number—are on the Quince, and the greater portion of these are trained upright and are bearing fruit. Peaches, Plums, Cherries, Pears, and Apples, some of each sort, are trained upright, at first as an experiment, but the experiment has proved to be so successful that henceforth I shall train every fruit tree upright. I expect every yard in length of a 12-foot wall should yield, when cultivated with Pears or Peaches, annually fifty fruits. Several of my trees do more than this year by year." I am afraid this gentleman amateur in a cold northern county would put to shame many of us professed gardeners who are more favourably situated.

The difference of opinion between Mr. Luckhurst and myself as to the merits of the two Pears named at page 70 merely proves more forcibly the necessity for local information. If he and others of equal competency will fill up the proposed forms carefully for three successive seasons, from their own experience at the time, I shall attach the same importance to their observations in their several localities as to my own. Of course nothing must be done from hearsay or memory, for, as Mr. Luckhurst truly says, the memory is treacherous and cannot be depended on for this sort of work; it has great difficulty in driving out old notions, which by the aid of careful chronicling ought to have been exploded long ago. When I wrote of weeding the returns of eccentricities of taste I was thinking more of the general abstracts to be made from the local returns than of the returns themselves.

I think it is very possible that among the Pears sent out within the last twenty years, some of superior merit will be found to do well over a wide tract of country, and which are at present comparatively unknown. Probably the local returns will have to stand on their own merits. When the general abstracts are made I neither propose to decide by individual taste nor by weight of numbers, but by something between the two. I think the return made by a man of known ability, and who is acknowledged to have a good opportunity of forming

an opinion, is sure to carry more weight with it than that of one who is not known to have so good a chance of obtaining information. But let it be understood that all I have said on the subject so far are merely crude suggestions.

I should be pleased to see Pear-growing become popular among our cottagers; it would be very interesting to them, and, if well done, highly remunerative. In this neighbourhood there are not many people who ever taste a good Pear, but it is extremely difficult to advise them how to commence cultivation.

Morello Cherries are becoming popular, a good-sized tree often paying a year's rent; but I can assure our friend Mr. Abbey (see page 65) the said trees are neither spurred nor have their shoots measured by inches. If the growths are a yard long they are laid in their full length and bear fruit throughout. Disbudding and pinching a few shoots in spring, and cutting out exhausted shoots after the fruit is gathered, is all the pruning received or required. When the idea is to economise labour and to have a fair return for the same, trees should be trained in the way their natural habit suggests; and it is just as wide of the mark to spur Morellos and Black Currants as it would be to train an Oak tree to a balloon trellis.

I would strongly recommend the *sécateur* (or French pruning shears) for summer-pruning, and indeed for pruning generally, excepting Peaches. It makes a cut almost as clean as the sharpest knife, instead of something between a cut and a squeeze as made by the common pruning shears, and the amount of work one can accomplish in a short time is astonishing.—WM. TAYLOR, *Longleat*.

### ROSES FROM CUTTINGS.

"PHILANTHUS," in his suggestive and seasonable remarks, page 89, opines that July is a far better time to put in cuttings of Roses than in November or October. I am precisely of the same opinion, having years ago proved, in the first instance accidentally, that cuttings inserted in the summer months take root with more certainty and celerity than if put in at any other period of the year.

It is now many years ago when budding Roses that, instead of throwing away the shoots from which I had taken the few buds required, I roughly shaped them into cuttings and stuck them into the ground at the base of the Briar stocks. It was a mere mechanical act without any serious thought that the cuttings would strike root; but they did so. Hardly one failed.

Since then I have adopted the plan systematically, and have never failed to strike as many Roses as I required by inserting the cuttings in July or August. The striking under the Briers suggested that some shade was necessary in this summer propagation of Roses. Subsequent practice has proved this to be so, for when the cuttings have been inserted in an open place, and a period of drought has followed, many of them failed to grow, but when planted in a north border failure has been very rare.

Cuttings of half, or rather more than half, ripened shoots 6 inches in length with all the foliage removed except the top pair of leaves, firmly planted up to these leaves, are almost certain to grow if put in at this season of the year. The main point to aim at is to keep the foliage fresh as long as possible, and to this end a shaded place and occasional sprinklings of water should be afforded.

Another point to attend to is that the cuttings cannot be too quickly made and put in, for if allowed to lie about until the bark becomes shrivelled they will not prosper.

Most varieties of Roses thrive well on their own roots, and some of them better than on stocks. Baronne Prevost on its own roots is much finer and sweeter than when worked, and so is the old Provence Cabbage Rose. Indeed, I have fancied that many Roses are sweeter when grown from cuttings than when worked on the Briar—certainly such is the case with those I have named. I have had blooms of John Hopper from cuttings growing at the base of the Briar invariably superior to those elevated above them and growing from the Briar stock; and the same remark applies to the lovely old Rose *Coupe d'Hébé*.

If stocks affect the quality of fruits, why should they not exert the same influence on flowers? As a general rule I believe Roses are sweeter when on their own roots than they are on any stock, and some of them are finer and most of them more permanent.

The present is a very good time to put in the cuttings, and

If firm wood is selected and the work quickly done; if 5 inches of the cutting are put firmly in the ground and 1 inch left out; if shade is afforded and water given occasionally, not one cutting in twenty will fail to grow.—A SURREY GARDENER.

### ROYAL ASCOT GRAPE.

SMALL BUNCHES VERSUS LARGE.

THIS Grape is doing very well with me this year—so well, in fact, that I am desirous of saying a word or two in its favour. It is a very distinct variety; the berries are large, elongated like a Muscat, invariably colouring well, of a deep glossy black, the singular lustre being visible through the bloom, imparting a brilliancy to the appearance of the ripe fruit that is very attractive. The bunches have none of the tapering symmetry peculiar to most other black Grapes, but consist of two parts, which may be compared to the shoulders of a large bunch of Black Hamburgh minus the remainder of the bunch, the berries being disposed in the form of clusters rather than of bunches. Although these clusters are hardly large enough to entitle them to be placed singly upon the exhibition table, yet they are sufficiently so for all practical purposes, the fruit itself being very large and of a rich, crisp, piquant flavour. Its free-bearing and equally excellent setting properties are too well known to need any commendation at my hands. The rage for big bunches has probably caused it to fall somewhat into neglect; but to those who only require a first-class Grape for table I strongly recommend it as a robust and sterling sort, which under fair treatment may always be depended upon for affording a supply of fine fruit as rich in appearance as in quality.

From the great utility of this Grape arises the thought, Are we right in regarding as best those kinds which produce the largest bunches? The experience gained in supplying the requirements of a large establishment induces me to reply, Decidedly not. It is true enough that large bunches of Grapes may obtain an extra meed of admiration when first cut as well as when suspended on the Vines, but it must never be forgotten that all Grapes are grown to be eaten, and it is upon the berries that a final and critical judgment is passed. Large bunches are therefore most suitable for exhibition and for grand occasions, such as large parties, but for everyday use nice little "lumpy" bunches of from 1 to 2 lbs. weight are much more useful. Being small the bunches are sooner used, a fresh supply is required daily, and the neat trim appearance of the Grape dish is certainly a pleasanter sight than when it contains the wreck of a huge bunch or two battered, bloomless, and absolutely greasy-looking. I am aware that this statement may appear antagonistic to my advocacy of a house of Gros Guillaume a short time ago, but in reality it is not so, such "fancy" houses being only suitable for extensive gardens containing several vineries, each of which ought, as a general rule, to contain only one kind of Grape, an early house or two forming the exception.

It is a fact well known to most Grape-growers that many sorts of Grapes may be made to produce either large or small bunches at will, and yet a decided preference is usually shown for the production of bunches of medium size. Small bunches result almost invariably from a rigid adherence to close pruning, and, other things being equal, there is an increase in size of bunch up to a certain point that is very much in proportion to the length of young wood retained upon the spurs. In pruning for large bunches attention is given to the selection of a full plump bud, especial care being taken that it is not a double bud, as it is most vexatious to see the supposed fine bud putting forth a couple of weakly shoots instead of the expected strong one. Another point of importance is to avoid overcrowding; a just balance must be maintained. Large bunches are borne on stout branches clothed with huge dark green leaves requiring ample space for their full and healthy development, while smaller bunches are produced on wood of less vigour, and consequently requiring less space.—EDWARD LUCKHURST.

### EARLY BEATRICE PEACH—ANGOUMOIS APRICOT.

We have gathered Early Beatrice Peach from a south wall on July 22nd, and kept it till the 26th, and we found the keeping to improve the flavour. We gathered Angoumois Hâtive Apricot from a west wall on July 26th quite ripe. The flesh is tender and juicy, with a rich piquant flavour.

It is quite a fortnight earlier than Moorpark, which on the same wall is only beginning to show a little pale colour. The fruit is of medium size and highly coloured. We consider it an acquisition.—J. C. LEE, *Hammersmith*.

### ROSES FOR A LIMITED COLLECTION.

I SEND you a list of Roses, not for palatial residences, but for those who with limited incomes admire the queen of flowers.

*Hybrid Perpetuals*.—Fisher Holmes, La France, Sénateur Vaisse, Madame Victor Verdier, Exposition de Brie, Charles Lefebvre, Maurice Bernardin, Madame la Baronne de Rothschild, Monsieur Noman, Camille Bernardin, Souvenir de la Malmaison, Bessie Johnson, John Hopper, Annie Laxton, Marquise de Castellane, Madame Parriaux, Alfred Colomb, Etienne Levet, Louise Van Houtte, Princess Mary of Cambridge, Prince Camille de Rohan. Madame Clémence Joigneaux as a pot Rose is superb, but shy out of doors.

*Tea*.—Gloire de Dijon, Madame de St. Joseph, Catherine Mermet, Madame Willermoz, Belle Lyonnaise (wall).

*Noisettes*.—Triomphe de Rennes, Rêve d'Or (wall), Lamarque, Céline Forestier, Maréchal Niel (shy). The above have bloomed well and are hardy. Any humble cottager can grow the above.—Rus, *Reading*.

### FRUIT TREES FOR NORTH WALLS.

It is generally considered that few kinds of fruit trees are suited for walls having a north aspect. The Morello Cherry is in most instances considered the best, and there is no gainsaying its free growth and bearing in such a position; but the chief value of the fruit is for culinary purposes, though some esteem them for dessert after hanging a time. There are those, however, who would be glad to put a north-aspected wall to a better use, or what to them is a more desirable one, than a glut of Morello Cherries. The May Duke, which I have in three examples on a north wall, bear quite as abundantly as the ten trees of the Morello on the same aspect. The May Duke upon the north aspect succeeds those on a warmer aspect, and they keep in good condition a long time. Elton bears but sparingly, and the White Heart is rather more prolific, but neither bear so freely as the Dukes and Morello. A Jargonelle Pear bears as well upon this as upon a more favourable aspect; and Pond's Seedling Plum, though it grows freely, cannot be said to be profitably prolific. Red Currants, also Black and White, do remarkably well on a north aspect, and if well netted they keep sound until late in the season.

There are no doubt other kinds of fruit that would do satisfactorily against a north wall, especially many kinds of Pears, as I have seen several kinds trained over the top of a wall, and down its north side, bearing as large, though not so highly coloured, fruit upon the branches on the northern as the sunny side of the wall, and keeping longer, ripening off very juicy and melting, with flavour surpassing that produced on the southern side, the fruit of which being sometimes hard and woody, with a very poor aroma, being devoid of juice, and anything but melting. Apples I have no experience of, and of Plums have only seen the Winesap producing satisfactorily. Gooseberries, of course, answer well, and keep very late.

The subject appears to me a suggestive one. Many Pears in the south are hard and do not ripen which in the north are excellent, and it is likely the kinds found to be woody, mealy, or insipid, would, if grown against a north wall, be melting and good. One thing is certain, a north wall is the best retarder and prolonger of fruits which in a sunny position do not endure long in season from over-ripeness, and the fact we want to know is what kinds of fruit a north aspect is adapted for other than the Morello Cherry?—G. ABBEY.

### POTATO CULTURE.

AFTER perusing works on the above published from the office of this Journal, I have been induced, amongst other points, to try the effect of earthing and non-earthing-up during growth. Growing a small quantity of Kidneys on a sandy loam manured in the autumn, I must say, so far as I have tried them, quantity is in favour of the non-earthing; but the question naturally arises, Why should this be so?

I conclude all rain falling is more liable to find its way into the trench caused by earthing-up, and thus the roots do not, taking the season through, receive a regular supply of

moisture as in the other method. But, again, as the best Potato districts in England or Scotland are not soils of a retentive character, why is the ridge system and earthing-up so generally followed, when on the flat with winter manuring can be found to yield in garden practice much better results? Since the disease is causing much discussion in your columns just now, differences in cultivation may also be advantageously ventilated, as tending to reduce or mitigate this evil.—**AGRICOLA.**

### CLOVE CARNATIONS FOR TOWN GARDENS.

DELIGHTFUL old flowers are Clove Carnations. As garden flowers they rank next in beauty, and sweetness, and usefulness to the Rose. We used to see them everywhere, but we now only meet with them occasionally in isolated clumps in mixed borders. Still, their cultivation is rapidly increasing. Their inherent claims will not let them be abandoned.

We used to be familiar with huge beds of these attractive flowers, and such beds are again to be found in some of our best and greatest gardens. That is the way to grow them. In large masses they are most striking.

I note them now to say that they will not only flourish in the pure air of the country but will thrive in the murky atmosphere of the town, and overpower even the smoke by their penetrating fragrance. In the gardens of the Middle Temple in the city of London may have been seen for the past month rich masses of these flowers, and by their side the Geraniums show to great disadvantage, as possessing neither the richness, the massiveness, nor the grace of the Cloves. Even when out of bloom these beds are attractive by their neatness and the pleasing hue of their foliage.

I note them at the present time also because it is the season for increasing the stock. Layering is the best and safest mode of increase, but it is well to know that, as hinted by "PHILANTHUS," they will strike readily by slips inserted in a shaded place at the present time. Whichever mode of increase is adopted there should be no delay, or blooming plants will not be provided for next year's display.

In striking the cuttings half an inch of sand or fine grit should be spread over the surface of the ground, so that when inserting them a portion will be carried down with the dibber and be settled firmly round the cuttings. These should be taken off with a heel, and have all the lower foliage trimmed away and be put in deeply, or, if very long, in a slanting position. If 6 or 8 inches of the slips are beneath the ground all the better. That is the plan which is adopted in cottagers' gardens where for generations the stock has been perpetuated.

Layering is preferable, but that implies established plants to begin with, and, unfortunately, not in one garden in twenty is this the case.

The plants grow best in strong soil, and in such soil they are seldom injured by frost. In light soil, and especially where the winter's rains are heavy, the foliage is prone to spot and the plants to decay. In such places the safe plan is to winter them in pots plunged in cold frames, to be planted out in February or very early in March. In every garden of this nature, and where means are provided, the plants are well worthy of this little protective care; but in most places no protection is needed, and in every garden in town and country they are worthy of a place. As garden plants they are ever attractive, and as out flowers they are rivalled only by the Rose. My advice to all in town or country is to cultivate these fine old flowers, and commence by layering or inserting slips at the present time.—**A TOWN GARDENER.**

### CAULIFLOWERS AND WIREWORM.

A SHORT time ago I planted a bed of Cauliflowers, and another of Cabbages. The weather has been unusually favourable for them. They made rapid progress, and I was consequently anticipating early and fine maturity; but "the best laid schemes of mice and men gang oft a-glee," and on looking at my plants one morning I was considerably chagrined to find them drooping—literally dying. I was at a loss to find a reason. Weather and all other accessories had been in their favour, and I had omitted nothing in their treatment, but there before me were the dying plants, and my visions of savoury dinners and pickled Cauliflowers seemed doomed to disappointment. In this dilemma I applied to a friend, who straightway went with me to the garden. He immediately pulled up one of the dying plants, and showed

me that wireworms were at work. Acting on his instructions I procured some lime, and gave the soil around each plant a drenching with lime water. The effect was soon apparent, for in a few hours both Cabbage and Cauliflowers regained their vitality, and are now apparently as vigorous as ever.

The facts as to the above case have suggested to me the reflection, Would a similar treatment have a like beneficial effect in the first stages of the new Potato disease? Happily we are here exempt from it, else would I myself have tried the experiment. Should you think the above worth publication, it may possibly induce some of your numerous readers to give it a trial. If successful, the next consideration would be as to mixing lime with the manure used in planting Potatoes. I know of many farmers who have done so with the best results, but I cannot go so far as to say that it will secure immunity or partial immunity from disease.

The weather in north Lancashire has been very fine this week, temperature 70° in the shade. Hot suns daily are fast ripening fruits, grain, &c., and our prospects are exceptionally good.—**BETA.**

### LORD NAPIER NECTARINE.

Among the many fruits raised by Mr. Rivers, one of the best is the Nectarine called Lord Napier. Its great size and beauty and its exquisitely delicious flavour combine to make it a fruit worthy of universal cultivation.

Fig. 14.—Lord Napier Nectarine.

For a Nectarine its size is unusual, being from 2½ inches to 3 inches in diameter. It is round, sometimes inclining to ovate, and depressed at the crown, in the centre of which is a small sharp-pointed nipple, from which issues a well-defined suture, which diminishes as it approaches the base. Skin greenish-yellow, but changing to cream-coloured when fully ripened, mottled and streaked with deep blood red on the side next the sun; when fully exposed the parts are completely covered with a very dark crimson cheek. Flesh yellow and translucent, mottled with white patches, remarkably tender and melting, very juicy, and very richly flavoured; it separates very freely from the stone, and is perfectly without any stain of colour.

This delicious fruit was raised by Mr. Rivers from seed of Early Albert Peach, and it is the earliest of all Nectarines, ripening eight or ten days before Hunt's Tawny.

### OLLA PODRIDA—A CONTINENTAL TOUR.

I AM going to try to disarm criticism by heading this paper "Olla Podrida," a name borrowed from an old Spanish word meaning a dish compounded of different materials, something like our hodge-podge, as I fear I shall be somewhat discursive, and shall be guilty of what is an unpardonable offence in a paper, a deviation from my text.

After a very cold and backward spring, or, I might almost say, a prolonged winter, we went for a short trip into north Italy, passing through France by way of the Mont Cenis tunnel, and returning through Switzerland *via* Lucerne and

Bâle, crossing from Italy into Switzerland by the St. Gothard Pass, and I thought it might interest some of your readers if I sent you a few remarks on the different changes of vegetation, and also on some of the public gardens and other things which I saw.

The season seems to have been nearly as backward in France as with us. I do not think I ever remember a spring when the hedges were so late in vegetating as they were this year. There was hardly a vestige of green to be seen till the second week in April; but just as they were late in starting, so they made most rapid strides when once the spring set in. And in travelling through England I noticed there was comparatively very little difference between the north of Yorkshire and the south, as in the third week in April I went from Yorkshire into Dorsetshire, and in the middle of May through from Yorkshire into Kent, and in both cases I do not think there was more than a week or ten days' difference in the forwardness of the vegetation between the north and the south. This, perhaps, was more especially remarkable in May, as between the 5th and the 16th of May we had some very forcing weather, which brought all vegetation on together. I remember amongst other things watching the development of the flowers of a large Horse Chestnut tree. On Saturday, May 9th, there was not a single flower fully expanded, and on Friday, May 14th, there was not a single flower which was not fully open, even on the north side of the tree in the shade; but then our temperature had reached from 78° to 80° in the shade three days running, and one day it had been up to 70° at nine in the morning, and remained so till after eight o'clock at night. The change which took place in the hedges was much the same; so that, though they were so backward in April, our May blossom was out by the 15th of May, which is forward for this part of Yorkshire.

Why I make these remarks is, that on crossing into the Continent I found they were not much forwarder in France, till we arrived near to Paris, than in England, and certainly in the warmer parts of Kent the vegetation was quite as forward as in the first part of France we passed through. From inquiries, too, which I made from persons who had wintered at Mentone, Nice, Rome, Florence, Naples, and other places there seemed to be the same general complaint that the winter had been unusually severe and the spring very backward nearly all over the Continent. We only stayed two nights in Paris, and found gardeners just beginning to put out the half-hardy plants in the gardens there; in fact, as I had begun to bed-out my own garden in Yorkshire, and had just put out the greatest number of my Geraniums by the 22nd of May, I did not find them much forwarder at Paris than with us. On the 22nd we left Paris for Aix-les-Bains, where we remained over the Sunday, and it was interesting to watch the gradual change in the forwardness of the foliage and in the character of the vegetation. Taking, for instance, the *Acacia* as a test, which is much grown along the sides of the railways in France, it was only showing bud near Boulogne, and we saw none in bloom till we reached Paris, and before we arrived at Aix, or rather soon after passing Dijon, the flowers were all over. It was curious, however, on the Monday, when going through the Mont Cenis Pass, to watch the flowers gradually reappear as we went higher up the valleys, till at last, as we arrived nearer to Modane, the foliage was hardly developed.

The climate of Aix is very warm; it is protected from the west by a high range of hills, the Dent du Chat, and on the east and north by the range of Alps; in fact, after crossing the Valley of the Rhône, the Vines in the different valleys were much forwarder than about Dijon and Maçon, and the Burgundy country. Here, too, for the first time we saw Indian Corn as one of the crops. And here I may remark, that wherever we went the Vines this year were looking remarkably well, and the paysans were already congratulating themselves on the great promise of an abundant vintage. This was the same both in France and Italy; in fact, in Italy the value of the exchange of English gold into Italian paper money began to be materially influenced by the prospect of an abundant vintage, the exchange falling in about six weeks from 28 liras to 26.60 per English sovereign. At Aix we first saw the *Paulownia imperialis* and *Bignonia*s growing luxuriantly. The foliage of trees and shrubs was very luxuriant, the shrubs making a marked feature in the public gardens. Here, too, there were more flowers grown in the gardens than in most places that we visited; in short, as a general rule, I may remark here the extreme paucity of flowers in any of the public gardens in Italy. Nor do you see flowers in cottage

gardens or even in gentlemen's grounds in the same way we do in England; such a thing, too, as a well-kept lawn or grass plot is rarely to be seen. The excuse is generally made that in warm climates the grass grows too fast and requires too constant care, and that if dry weather comes on it burns up; but the fact is that the grass is left to grow for so long that it becomes brown and bare at the roots, and then when it is cut it cannot stand the sun.

French and Italian gardeners think that once a month is quite often enough to cut a lawn, and in some places, as at Bellagio, in front of the *Hôtel Grande Bretagne*, a grand new garden is laid-out with beds edged with terra cotta tiles and a fountain, while the grass plots are nothing but weeds, as Plantains and Sow Thistles, Shepherd's Purse, *et id genus omne*, allowed to grow at their own will. The effect in this particular case I allude to was most ridiculous, especially when the flower beds were filled with half-hardy annuals, which in the beginning of June required a strong magnifying glass to see; but there, too, the shrubs were the redeeming feature. However, I am digressing, but I remarked at Aix that there were more flowers and better shrubs than at most places, but lamentably injured by want of sufficient care and attention to the surroundings. The truth is, in these favourable climates gardeners seem to trust to Nature.

It was very pleasant, however, to meet with some old friends in the shape of Roses in the gardens of the inns, and there were very good specimens of our old favourites Général Jacqueminot, Gloire de Dijon, Souvenir de la Malmaison, and others in the garden of the *Hôtel de l'Europe*, where we stayed over the Sunday. I can strongly recommend any persons who wish to see the scenery on the Mont Cenis route to advantage to make Aix-les-Bains a resting place instead of going straight through from Paris to Turin, which is a long and fatiguing journey, and if one leaves Paris in the morning to go straight through to Turin the tunnel and the scenery about Mont Cenis is passed at night. There are few prettier places than Aix and the district including the Little Lac de Bourget with its very clear and translucent waters.

I will pause here and continue my remarks about Italy, &c., in another number.—C. P. P.

## CARNATIONS AND PICOTÉES AT SOUTH KENSINGTON.—JULY 21ST.

But first let me say a word about the place itself. It really seemed as if some magician's wand had been waved over it and transformed it all. For some years one has never gone up to South Kensington without having to ask the question "What's up now?" and was sure to hear that something was going wrong. I know very little of the rights and wrongs, and should feel myself utterly disqualified from giving an opinion; but there was the fact, discouragement was ever the tone, and those who loved horticulture sighed to think what grand opportunities were being wasted. Well, Wednesday certainly brought no climatic influences to cheer one's spirits. A cruel and incessant downpour would under ordinary circumstances have thrown a damper on everything; but one saw or heard nothing of the kind. A general hopefulness pervaded the countenances of all whom one met. Men of all grades in horticulture—nurserymen, amateurs, gardeners—all spoke hopefully; and when Mr. Boscawen, as a member of the Council, asked the exhibitors to allow the exhibits to remain for another day, the cheerful acquiescence with which the proposal was met augured the best things for the Society, and it clearly showed that it will not be the fault of the horticulturists if the Society does not emerge from the clouds which have enveloped it. It was like passing away out of the mists and fogs of some dark valley to the bracing air of the mountain tops.

And now as to the Carnations and Picotees. It was a good sight for the eyes of an old florist to see even the few stands that were exhibited, and to note that there were three new exhibitors amongst amateurs—J. F. Burnaby-Atkins, Esq., Mr. Douglas, and myself; for although I have grown them for these thirty years and more on and off, I never exhibited a stand before. The prizes awarded by the Royal Horticultural Society have already been commented upon, let me now speak of those offered by the Metropolitan Floral Society; Mr. Burnaby-Atkins not competing for these, as he was not a member. There were but three exhibitors in Picotees and two in Carnations, Mr. Douglas taking first, as he is always sure to do in anything he goes in for, and on this his first appearance taking all the four first prizes. His Picotees were Ethel, rose edge; Admiration, heavy-edged purple; Mary, purple; Miss Small, red edge; Picco, purple edge; Princess of Wales, heavy-edged purple; Miss Williams; Mr. May, purple; Mrs. Hornby, light red edge; Miss Turner, red edge; Mrs. Allcroft, rose edge; and Juliana, red edge. Mr.

Only was second; his box contained amongst other flowers Rev. C. Matthews, Miss Fisher, Ensign, Gem of Roses, and Regulus. My own box was third, and was by no means satisfactory. Some of my blooms were not fully out, and I have not the slightest idea of how to dress a flower, and if I had the idea I doubt if I could do it. Mr. Douglas was again first in Carnations. His flowers were Campanini, Marx, and Guardsman, and I am sorry that I did not take the names; but in the list given in the Journal in the article on Mr. Turner's nurseries will be found a list of some really good flowers.

It was amusing to hear the remarks as friend after friend "poked fun" at me. "Ah, 'D.' you are in your element now." "Ah! there is a text for you," as an exhibitor stated that in old times they used to give as high a prize for a stand of Carnations and Picotees as for a collection of stove and greenhouse plants. Well, so it is a text. These flowers require great care, time, and expense. They are attractive to many whose means will not allow them to cultivate larger plants, and they have a beauty of their own, evanescent indeed, but still peculiar and attractive, and they ought to have more encouragement than they at present receive. Should our Metropolitan Floral Society be able to hold on its way I hope that it may be able to give still further encouragement to this lovely tribe. "Ah! but," someone said, "the flowers are not so good as those of former days." This I utterly deny—they are not only as good but a great deal better; and when the person who said this was brought up in front of Mr. Turner's stand he was fain to "eat his leek" as far as size, smoothness of edge, and delicacy of marking. In Picotees especially—I am not sure that the improvement is so great in Carnations—there is, I believe, vast improvement; but the rules for exhibiting have been greatly relaxed since those days, and I do not see quite how they could be enforced with these larger and fuller flowers. In those days, although they were exhibited on cards, yet the judges used to lift up the flowers, and if when they came out of the cards the petals were slit or the petals hung about the bloom were disqualified; but now a petal may be burst to the bottom, petals may be "anyhow or nohow," but the magic art of the dresser transforms it. Let John Ball take such a flower and have it for about two minutes, and you would never know the flower to be the same. Petals are pulled out altogether, others twisted into more convenient places, and the flower assumes a more symmetrical appearance. It may be a matter of question how far this is desirable, and indeed the code of honour amongst florists' flowers is, to say the least of it, peculiar. If a man gouges out the eye of a Dahlia he is disqualified, but he may pluck and pull as he likes at a Carnation or a Pink and it is all right. As I do not know how to manipulate one it may be retorted on me that it is the old story of the fox who lost his tail; if I say that I do not at all see that the flower gains in beauty and I am quite sure it deceives the multitude. My stand looked of course untidy besides those wonderfully dressed flowers, but I honestly prefer a well-filled-up centre, even although it may appear a little confused, to those whose every petal is laid out in order and the centre is nowhere. Indeed, I would re-echo Moore's lines—

"Lesbia wears a robe of gold,  
But all so tight the nymph hath laced her,  
Not a charm of beauty's mould  
Presumes to stay where nature placed it.  
But oh! for me my Nora's gown  
That floats as wild as mountain breezes,  
Leaving every beauty free  
To sink or swell as Heaven pleases."

And as I look over the few pots of plants I have I do not think as I examine their blooms, that I should gain much by altering their whole contour. It is the old story of nature versus art. The exhibited bloom is a work of art, the other is nature's production.

Let me also bear witness to the attention that these flowers always receive, and let us hope in the brighter days dawning upon us they may resume their former place of consideration.  
—D., Deal.

### MUSHROOMS IN 1875.

In your foot-note to "A. R., Bromley," you say that "the year has been prolific of all species of Fungi. Even in the north of England the markets were supplied largely with the common Mushroom as early as the first week in July." Now, as a native of the north, and an old Mushroom-gatherer, I fancy you are labouring under some mistake. Last year the districts of the north, comprising Cumberland, Westmoreland, and portions of Lancashire, supplied many tons of Mushrooms to the principal markets; but this year, so far, I question whether an aggregate of a dozen measures have been gathered in the three counties. The temperature so far has never been suitable. We have had plenty of showers, but they have not been followed by sufficient heat to develop good crops of Mushrooms.

During the last week we have had hot weather, and it is

possible that Mushrooms may spring, but I do not entertain any hope of 1875 being a plentiful year. In my experience I never recollect two good successive years of Mushroom growth, even when the season is favourable. The land appears to need a few years' rest before producing another plentiful crop. A few hints to Mushroom-gatherers may prove useful in preventing accident. Never gather Fungi from a damp marshy place, especially under trees or hedges. They are poisonous. The edible common Mushroom is of a bright salmon colour on the under side in its first growth; afterwards of a black colour. In this latter stage it is best for making ketchup. The edible Mushroom when broken gives forth a fragrant smell, and has a thick healthy appearance. The poisonous Fungi are fleshy, of a pale sickly colour underneath, and the smell is nauseous. Anyone who has ever experienced the smell of the edible Mushroom can never mistake it for the poisonous one.—BETA.

[Our note was not founded on mistake, for we saw at Scarborough and other places near the east coast of Yorkshire Mushrooms in profusion. Every little fruiterer had baskets full on sale, and they were hawked about by women and children every morning.—EDS.]

### ROYAL HORTICULTURAL SOCIETY.

AUGUST 4TH.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. Mr. Miles, The Gardens, Wycombe Abbey, sent two Pines, distinct varieties, for the purpose of showing what is being sold in trade for Charlotte Rothschild. One was true, having the cylindrical broad-shouldered fruit, the other similar to a Queen, and especially to the Ripley Queen. It was stated by several members of the Committee that this mistake is very prevalent. Mr. Whittaker, Crewe Hall, Crewe, sent a seedling Melon—oval, and with a rich yellow-netted skin. The flesh is red, but the flavour was not superior. Mr. Stevens, gardener to G. Simpson, Esq., Wray Park, Reigate, sent a seedling Melon Wray Park Gem, which was quite unripe. Mr. White, gardener to Lord Listowel, Connamore, sent a Little Heath Melon. Mr. Perkins, The Gardens, Thornham Hall, Eye, sent a Victory of Bath Melon, of good flavour. Mr. Owen, Broughton Gardens, West Derby, sent a brace of seedling Cucumbers, which were much admired, but not an improvement on existing varieties.

Mr. William Paul sent a dish of Citron des Carmes Pear, and a dish of St. Etienne Pears came from the Society's garden at Chiswick. It is a very early yellow variety, and ripens in the end of July.

FLORAL COMMITTEE.—C. Noble, Esq., in the chair. The appearance of the Council-room on this occasion proved that the great Show on the 31st of July was no mere spasmodic effort on the part of the horticulturists, but the first expression of improvement designed to be permanent. The Exhibition to-day is but a reflex of the confidence which is now established, and which, we doubt not, will be sustained. Of this the collections of plants from Messrs. James Veitch & Sons, Mr. B. S. Williams, and Mr. Bull are an emphatic augury. Added to these were Roses from Mr. W. Paul, Waltham Cross, and Messrs. Paul and Son, Cheshunt, and Hollyhocks from Mr. Chater, so that the room presented quite a gay appearance.

The group of plants from Messrs. Veitch comprised a beautiful plant of *Adiantum princeps*, to which a first-class certificate was awarded. This is a very elegant Fern, somewhat similar but in all respects superior to *A. formosum*. A similar award was also made to *Asplenium ferulaeum*, which is one of the most graceful plants of this graceful family. Its fronds are about a foot in length, are beautifully arched, and as fine in the pinnae as are the most delicate *Davallias*. This is undoubtedly an acquisition and must become a great favourite: it is a native of Columbia. Thoroughly distinct from these, and indeed distinct from others of its genus, is *Dracena Taylori*, a hybrid from *D. magnifica* and *D. Mooreana*. It is of robust habit, with broad foliage of a metallic hue, and is altogether a striking variety. It received a first-class certificate. A like award was also made to *Dracena elegantissima*, a dark-coloured plant with narrow leaves of sub-erect habit. It is of dwarf growth and elegant outline, and one of the best of the family for table decoration. First-class certificates were also awarded for hybrid *Rhododendrons* *Duchess of Teck* and *Prince Leopold*, the former being of a soft buff colour, the latter a buff suffused with crimson. Each truss contains about a dozen flowers, in form very similar to *Weigela*; they are a very valuable race, from *Lobbii* and *Princess Royal*—the latter having been raised from *D. javanicum* and *D. jasminiflorum*. A species of *Alseodaphnia* from the Philippine Islands, provisionally named *Philippinense*, had also a first-class certificate awarded. It is a very fine species, the pinnae being twisted, giving it a distinct appearance. Exhibited by the same firm was a distinct form of *Pitcher Plant*—*Nepenthes marginata*—the rim of each pitcher being white, the body of a dark brown. Also, taken from the open

ground, was a basket of *Olearia Hastii*, a small shrub-like plant 6 inches high, densely covered with white Saxifrage-like composite flowers. They also exhibited fine plants of *Cissus Hendraei*, *Crotons*, *Zamia Wallisii*, *Platyocorium Wallineki* (first-class certificate), *Gloxinias*, and a singular and not uninteresting *Orchid*, *Pescatorea lamellosa*.

In Mr. Williams's collection *Alseophila australis* Williamsii had deservedly a first-class certificate. It is thoroughly distinct, and altogether a magnificent tree Fern of a weeping character. Another Fern, *Woodwardia radicans cristata*, is equally distinct and had a similar award, as also had *Streptocarpus Greenii*, a plant with *Gloxinia*-like leaves and lavender-coloured Mimulus-like flowers; it is very ornamental. Mr. Williams had also a well-grown plant of *Adiantum farleyense*, for which a vote of thanks was given. The rest of the group embraced *Palms*, *Dracenas*, *Ixora Dixiana*, *Hemantus puniceus*, *Dipladenia amabilis*, *Anthericum majesticum*, *Bertolonia Van Houttei*, &c., all in admirable condition.

Mr. Bull's collection was less extensive, but contained some distinct and fine plants. First-class certificates were awarded to *Cibotium Manziense*, with very vigorous fronds, and *Dracena Rex*, a dark variety of bold massive habit. Mr. Bull also exhibited *Orchids*, *Macrozamia*, *Liliums*, and *Hyacinthus candicans*, with six spikes 5 feet high, and a hundred bell-shaped white flowers, for which a cultural commendation was awarded.

*Begonia Froebellii*, Aph. de Camille, had a first-class certificate awarded. This is a bulbous-rooted kind, highly distinct; it has rich scarlet flowers, and Hollyhock-like leaves. It appears to have been grown in the open air, and is very striking. It is exhibited by Messrs. Froebel & Co., Zurich, and is a native of Ecuador.

The *Roses* from Mr. W. Paul comprised good blooms of the varieties which have been previously exhibited; and Mr. Chater's *Hollyhocks* were very fine both in spikes and blooms.

Messrs. Paul & Son, Cheshunt, had a second-class certificate for *Rose Duke of Connaught*, a medium-sized bloom possessing the velvety richness of Lord Macanlay with good substance of petal, and an agreeable perfume. They had other varieties, the most noticeable being a box of *Madame Lesharme* of great merit. As seen in the condition as here exhibited this variety has a charm which cannot be gainsaid. We never saw it so good, or "*D. Deal*," look better pleased than when admiring these truly lovely blooms. They were grown in the open air.

Mr. Dean had cut blooms of his useful Stock Mauve Queen, striped *Petunias*, and a semi-double yellow *Anrioula*. Out blooms of *Rosa bracteata* (single white Macartney) from Mr. Chater proved how well adapted is this species for the decoration of vases for the table.

### EARLY SNOWBALL CAULIFLOWER.

THIS proves a great acquisition, and will take a leading place among Cauliflowers. It is wonderfully dwarf, with compact white heads well protected by the leaves, and is really as early as its raiser asserts. I have lately been cutting excellent little heads of about 4 inches in diameter that are perfect models of what a first-class Cauliflower should be. The seed of this crop was sown on March 8th. I confidently anticipate that it will also prove an important addition to our late-autumn and early-spring supply, its compact dwarf growth admirably adapting it for fitting into frames and also for wintering under handlights. Seed sown now would afford a capital supply for the October shooting parties.—EDWARD LUCKHURST.

### PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

*VANDA LIMBATA*. *Nat. ord.*, *Orchidaceae*. *Linn.*, *Gynandria Monandria*. Native of Java.—Flowers orange, scarlet, and pink. Introduced by Messrs. Williams of Holloway, with whom it flowered in July, 1874.—(*Bot. Mag.*, t. 6173.)

*DIETES HUTTONI*. *Nat. ord.*, *Iridaceae*. *Linn.*, *Triandria Monogynia*. Flowers yellow, crimson striped.—"Sent by Mr. Hutton from the eastern province of the Cape Colony to the Kew collection, where it flowered in the month of March of the present year. This genus *Dietes* is scarcely distinct from *Iris* by any botanical character."—(*Ibid.*, t. 6174.)

*CYPERIDIUM AEGYPTIACUM*. *Nat. ord.*, *Orchidaceae*. *Linn.*, *Gynandria Diandria*.—Flowers many-coloured, petals profusely spotted with purple. "It was discovered by Mr. Wallis, Messrs. Veitch's collector, in the Island of Luzon, one of the Philippines, and was flowered in Messrs. Veitch's establishment in March of the present year."—(*Ibid.*, t. 6175.)

*CROCUS MINIMUS*—*CROCUS FLEISCHERI*. *Nat. ord.*, *Iridaceae*. *Linn.*, *Triandria Monogynia*.—"These are two welcome additions to our stock of spring Crocuses grown in this country. *C. minimus* was in the country before, but has been lost for

many years, indeed till now, when Mr. George Maw has brought it again from Corsica. It is frequent in that island, flowering in low situations in January, and upon the mountains up to March, and occurs also in Sardinia. It is the smallest of all the spring-flowering Crocuses, and is most like some of the varieties of variegated, but it has been confounded in this country with *hibernus*.

"*Crocus Fleischeri* is another interesting addition to our stock of garden bulbs made by Mr. Elwes in his tour in Asia Minor last spring. It is a very distinct plant, and has never been in cultivation before. The points which best mark it from other spring-flowering species are the divided stigmas and very complicated bulb-coats, the fine fibres of which are plaited in regular vertical strands. It was discovered on limestone hills near Smyrna by the botanist whose name it bears, and we have it also from *Officia* gathered by Ancher Eloy, and from *Lycia* gathered by the late Professor Edward Forbes. The specimen drawn came from the rich collection of the Rev. H. Harpur Crewe."—(*Ibid.*, t. 6176.)

*TULIPA GREIGI*. *Nat. ord.*, *Liliaceae*. *Linn.*, *Hexandria Monogynia*.—Flowers scarlet; leaves regularly spotted. "During the last two years no less than three striking new *Tulips* have been added to the list of species cultivated in this country. Although they come from different localities, they all three resemble one another closely, both from a botanical and horticultural point of view. They are *T. botica* of Boissier, a native of Greece; *T. Eischleri* of Regel, a native of Georgia; and *T. Greigi*. This species was gathered in Turkistan by Sewersow and Fedtschenko, and was named by Dr. Regel in compliment to General Greig, President of the Imperial Russian Horticultural Union."—(*Ibid.*, t. 6177.)

*PLUM*.—*The Sultan*.—"This fine new Plum is a seedling raised by Messrs. Rivers & Son of Sawbridgeworth in 1871. Dr. Hogg, in the new edition of his 'Fruit Manual,' describes it as 'a culinary Plum of great excellence; ripe in the middle of August.'

"The following is Dr. Hogg's description:—'Fruit above medium size, round, marked with a deep suture. Skin dark purple, covered with a thick blue bloom. Stalk about half an inch long, inserted in a wide hollow. Flesh greenish-yellow, adhering to the stone, firm, briak, and sweet, with a pleasant flavour.' Our own notes of the fruits submitted to us run thus:—'Fruit round, about middle size, with a rather shallow suture. Skin puce-purple or dark purplish red, dotted with minute brown specks, and covered with a thin bluish bloom. Stalk set in a deepish cavity. Flesh deep greenish-yellow, separating tolerably freely from the stone, juicy, and with a pleasant flavour, similar to that of the Orleans Plum.

"It is a handsome and useful Plum, and one which, being of prolific habit, is likely to become a favourite with fruit-growers."—(*Florist and Pomologist*, 3 s., viii., 145.)

### POROUS GARDEN POTS.

So far from having any prejudice in the matter I am one of the first to welcome Mr. Simpson's able communication. I have no interest in condemning, neither do I condemn, glazed pots. I know careful and clever plant-growers can grow plants in them, but I know also they are not safe to recommend for indiscriminate use in the regular practice of everyday plant-culture. I fully admitted the disadvantages of very porous pots, and pointed out these disadvantages with the means necessary to prevent injury. What I meant to say was that the safe course for general—which includes many who are not experienced—cultivators is the medium course, and that the extremes of absolutely dense or poreless pots on the one hand and excessively porous pots on the other are neither of them the best to recommend for general use.

I must ask Mr. Simpson to believe that I have actually practised with all the plants he names, also many others, and it is sufficient that the Editors are satisfied of my competency and disinterestedness to speak on the matter. As to the time and place of experiments, that is in no way material. The question is neither chronological nor geographical, but one of practice and judgment as to which pot—open, close, or medium as to porosity, or clean or dirty as to condition—is the best and most reliable for general use. I have every reason to recommend a thoroughly well-made clay pot, and I believe the makers of such pots may go on manufacturing, as not in this generation will such pots fall into disuse and be superseded by vessels of metal or glass.

For a long time I had a prejudice against clean pots, but

four years under a cultivator of some of the best plants which have been exhibited at the London shows entirely converted me to their use. Every year I was permitted to use a limited number of dirty pots for every kind of plants, which were grown in quantity. Since then I have always used clean pots, and I am sure I should not have been at the trouble of cleaning them had I not been conscious of the advantage of doing so.

I am acquainted with the plants of Dalketh, and can testify as to their excellence, yet I venture to believe that if Mr. Dunn received a new and rare Orchid demanding special care that he would not put it in glass, nor if he had a Heath of great value that he would grow it in a vessel of iron. I have the utmost respect for the practice—general and special—of Mr. D. Thomson; but what he can do everybody else cannot. His work is very familiar to me, for, like Mr. Simpson, I am proud to have been drilled in the school which Mr. Thomson has done so much to make famous. Possibly between Mr. Simpson and myself there may not be much difference of opinion as to what each of us would do under given circumstances, but between that and recommending a principle for general adoption there is a great difference.

It is not what can be done as a feat of skill, but what is the most safe and reliable practice for the great body of skilled and unskilled culturists that I prefer to keep in view when speaking of and recommending a mode of practice. For instance, while I can read a book almost as well wrong end upwards as right, I do not recommend that practice to be taught in schools. I much prefer the "general practice," for which, in gardening matters, I am sorry to see that Mr. Simpson has so little respect. The general practice under which the plants, fruit, and vegetables are produced by British gardeners which adorn our principal exhibitions is, I hold, worthy of great respect, and is more authoritative as an example to follow than is a special feat under special circumstances, and by special skill which happens to be worthy of notice.

I quite believe Mr. Simpson when he says that his bedding plants in dirty pots are as good as those of others in clean pots, but I interpret that as a greater compliment to the man than the pot. I do not recommend clean, well-finished, and well-burnt clay pots because plants will not grow in any others, but because these I prefer are the safest and the best, and I believe they will so prove themselves after another fifty years of practice. I thank Mr. Simpson for his letter.—EX-EXHIBITOR.

For some years past our garden pots have been painted inside and out with creosote in a boiling state. The reasons why I adopted this plan were three: Firstly, to prevent evaporation and cooling of the surface; secondly, to prevent fungus growing on the outside; and thirdly, to strengthen the material by filling up the pores. The colour after creosoting becomes of a rich brown, and not unsightly. My pots are made on my own pattern—shallow, to facilitate applying fresh material on the surface. I think there is no valid reason for imagining that a plant requires a porous pot.

—OBSERVER.

### OUR BORDER FLOWERS—GEUMS.

THOUGH the Geums are a rather numerous family we seldom meet with many of them in cultivation. In looking along our hedgerows we often see *Geum urbanum*, but being so common it is passed by without much notice, except by some of the collectors of herbs; but not so with *Geum rivale*, for some think it worthy of a place in the herbaceous border, and look upon it as a rarity. It is improved in stature under cultivation, but I always admire it most in its own native habitat, for to see this plant in a moist plantation on the limestone near a river, covering the ground with its leaves and graceful pendant flowers, is a sight not soon to be forgotten.

When we turn our attention to what may be termed garden varieties, and look on *Geum coccineum*, we see one of the brightest-coloured flowers that eyes can look upon. It is of rather pleasing habit, continuing long in flower. *Geum strigosum*, approaching to dark crimson in colour is also a charming border flower. *Geum pyrenaicum*, a yellow-flowered variety, is desirable for change of colour. *Geum album*, though an old plant, is seldom met with. *Geum grandiflorum* is one of the finest of the tribe, and ought to be in every garden. *Geum triflorum*, a dwarf kind with yellow flowers, is a desirable plant for the rockery, and is a very pretty plant for the front row in the border; it does not object to partial shade nor a moist situation, but should not be saturated with water.

*Geum montanum* is of rather taller habit, and is very desirable for the rockwork or borders. There are many others of this family that are interesting, but are seldom met with except in some very extensive collections.

They will thrive in most ordinary soils, but a little extra care will not be lost upon them. They delight in a rich tenacious loam, with a little well-decomposed manure or leaf mould and sand added. They are easily increased by seed or division after flowering. Some of the taller-growing kinds require staking to prevent them from being broken by the wind.—VERITAS.

### EARLY WRITERS ON ENGLISH GARDENING.

No. 6.

JOHN ROSE.

THE next writer following in the chronological order is John Rose, whose little volume, the only one for which he furnished the materials, appeared first in 1666, and subsequent editions in 1672, 1675, and 1691. I was misled once to mention him as the alleged author of an essay "On the Admirable Virtues of Coral," but I then doubted, and am now of opinion that it was not his production.

The volume which certainly owed its birth to him is "The English Vineyard Vindicated, by John Rose, Gardiner to his Majesty at his Royal Garden in St. James's. Formerly Gardiner to Her Grace the Dutchess of Somerset. With an address where the best plants are to be had at easie rates." Such is the title-page of all the editions, and the work is bound usually with Evelyn's translation of "The French Gardiner."

Rose says that it was "the supremest glory" of his profession to be the King's gardener, and he dedicates his book on "the Prince of Plants to the Prince of Planters," a title the King deserved on account of his "magnificent and emolumental encouragement of the culture of trees and fruit."

The origin of the book is thus told by Mr. Evelyn: "Being one day refreshing myself in the garden of Essex House, and, amongst other things, falling into discourse with Mr. Rose, then gardiner to Her Grace the Dutchess of Somerset, and particularly the cause of the neglect of vineyards of late in England. He reasoned so pertinently upon that subject (as, indeed, he does upon all things which concern his hortulan profession) I was easily persuaded to gratify his modest and charitable inclinations to have them communicated to the world." The result was that Mr. Rose gave the information, and Mr. Evelyn reduced it to writing.

For vineyard culture Rose recommends the Black Cluster, White Muscadine, Parsley-leaved, Muscadella, (not the Muscadine), Black and White "Frontiniques," and "a new white Grape, ripe before the Muscadines, which I found in his Majesty's garden at St. James's, with a red wood and dark green leaf, and ripening as soon in standards as against some walls."

Mr. Rose must have had permission from his royal employer to rear and sell Vines, for at the conclusion of his cultural instructions he states that he had "furnished himself with so plentiful a stock of sets and plants of all those sorts which he chiefly recommended, that those who desire to store their grounds might receive them of him at very reasonable rates."

We have no means of judging what Rose's taste was in ornamental gardening, but probably it was not differing from that which prevailed at the time. One of his fellow servants of the King, Hugh May, controller of the works at Windsor, told Pepys that "having the best walks of gravel in the world, and the green of our bowling allies excoelling, we need only a little mixture of statues or pots, which may be handsome, and filled with another pot of such and such a flower or green as the season of the year will bear; and then the flowers are best seen in a little plot by themselves, besides their borders spoil the walks; and then for fruit the best way is to have walls built circularly one within another."

The title-page I have copied only tells that Rose had been gardener to the Dutchess of Somerset; that was at Essex House in the Strand, and there also he was gardener to the Earl of Essex, as he had subsequently been to the Dutchess of Cleveland at Dorney Court in Buckinghamshire.

We have more than one evidence of the liberal, not to apply the severer term lavish, payments made by the Dutchess of Cleveland, not only upon her own residences, but upon her dependants whom she specially approved. Rose was one of these, and she probably obtained for him the royal gardenership, for he was promoted to it whilst she was the prime royal

comenbine. She was enabled to be lavish by the income poured upon her by the King. "They have bestowed ten thousand pounds a-year more upon the Duchess of Cleveland," wrote Andrew Marvel, "and she has likewise near ten thousand pounds a-year more out of the new form of the county excise of beer and ale, and five thousand pounds a-year out of the Post Office. All promotions, spiritual and temporal, pass under her cognisance."

Immediately after the Restoration, in November, 1660, the office of Keeper and Gardener of the Garden in St. James's Park, with a salary of £40 a-year, was granted to Rose; and on February 21st, 1666, a warrant was issued to pay him, appointed keeper of St. James's garden in place of Andrew and Gabriel Mollett deceased, £240 a-year for wages for keeping the said garden. Finding that Rose's stipend was so liberal, knowing also that both the Duchess of Cleveland and Charles II. rewarded liberally the servants they best liked, and further knowing that Evelyn and other men of good position patronised Rose, I thought it probable he died possessed of property requiring to be distributed by will. I was not wrong in my conclusion, and I have inspected a copy of the last will and testament of "John Rose of St. Martins-in-the-Fields." It was executed on the 22nd of February, 1676, and proved on the 24th of September, 1677.

The nearest relatives mentioned are a nephew named William Walker, and a niece, Elizabeth Chamberlayne. To them, their children, and many friends he bequeathed small legacies, amounting to nearly £400, but the bulk of his property he devised to the parish of Amesbury (Almesbury in the Will) in Wiltshire, of which I conclude he was a native. In it and its vicinity he had two copyholds and two farms, and in that county resided some of his legatees. Only one of these was of his own name, "Captain John Rose, of St. Clement Danes," and he is only mentioned as his "friend."

He made his sister-in-law, Eva Stanton, executrix and trustee, devising to her the residue of his property and his freehold lands at Ditchet (Detchet) in Somersetshire for the purpose of presenting a gilt communion plate to the church of Amesbury; £10 to be at once distributed among the poor of that parish; and to secure £80 a-year to an orthodox schoolmaster for instructing twenty scholars there, natives of the town. His funeral expenses were not to exceed £100.

The will was proved in seven days after his burial, for on reference to the register of the church of St. Martins-in-the-Fields I found this entry, "1677. John Rose. Sept. 17th. Sepult. in ecclesia."

His interment in the church shows that he was a parish magnate, a conclusion deducible from Evelyn's notice of him; and we have the further testimony of a contemporary gardener, for Switzer in his "Iconographia" says "Mr. Rose was first gardener to the Lord Essex at Essex House in the Strand, and afterwards to his Royal Majesty King Charles II. at the royal gardens in St. James's Park. He was esteemed to be the best of his profession in those days, and ought to be remembered for the encouragement he gave to a servant of his, who has since made the greatest figure that ever yet any gardener did, I mean Mr. London. He (Mr. Rose) may be well ranked amongst the great virtuosos of that time (now dead) who were all well pleased to accept of his company while living."

Having discovered Rose's connection with the county of Wilts, and that Sir B. C. Hoare in his history of that county has merely mentioned his name, I induced "WILTSHIRE RACER" to visit Amesbury, and he thus tells of its results—

"Amesbury in South Wilts is an awkward place to get to from North Wilts. Just as there are many cures for the tooth-ache because none are certain, so there are many ways recommended to those who wish to go to Amesbury because none are very direct. 'How can I best get to Amesbury?' had been for some days my question to everybody I met. 'Take train to Devizes, then drive on eighteen miles across the Plain,' said one. 'Go to Wyke and then drive ten miles,' said another. 'Go to Salisbury and then drive nine miles,' replied a third. 'Or go —;' but I grew tired of the various suggestions and chose my own route, which was to take train to Wilton and then drive eight miles across the Plain.

"Anyway Amesbury is an awkward place to reach. Rather an advantage this, given fine weather, which I had, because an out-of-the-way place retains some distinctive characteristics which are being fast obliterated by the universal nearness of railway stations. Peculiarities of dialect must soon go when everyone travels, and everybody will be educated, and hence a universal sameness will succeed.

"Reaching Wilton by rail I proceed behind a tired horse—(June is a great month for excursions, and horses are woefully hardworked)—and ascend those downs called Salisbury Plain, so called, I suppose, because not a plain. How grand that old unaltered open country is, and at this time of the year it is not dreary as in winter. About me, around me, above me, beneath me, is a sea of green; here and there corn waving in the sunlight, but more frequently the grass as of yore, though the bustards are gone, and even the Bustard Inn is no more. But the corn patches are not enclosed, so all is open and free to the eye as in the days of the Druids. After ascending the downs for a time we bend downwards to the valley of the South Wilts Avon (there is a North Wilts Avon as well); and, as always by a river's brink, there is a richer soil, more trees, and man's dwellings. Long straggling villages all named Woodford—Lower, Great, and Upper Woodford—are in turn passed. I notice that even in these out-of-the-way nooks in the bettermost cottage gardens among the old Cabbage, old White, and the old Maiden's Blush, how modern-named Roses have begun to make their appearance; and in the windows, instead of the old gawky sparsely-flowering Geraniums, are now the modern large-trussed bedders, making the low casements bright with bloom.

"The country improves as I go on until I come upon trim cottages, pleasant farmhouses, and, oh! one charming Elizabethan residence. No longer the short herbage of the down, but rich grasslands. I soon enter Little Amesbury, a neat hamlet with one fine old house, and crossing a bridge over the Avon—rather a wide stream at this point—I am in Amesbury, one of the many small towns of Wiltshire. I have as yet no knowledge of the place, save as connected with the great annual coursing parties lasting a week, the last day of which the meeting is at Stonehenge close by; and I also have heard that there is a glove manufactory in the town, while in common with all educated Englishmen I know the fact that not only British but Roman remains are near. Across the bridge to the left stands the church, formerly conventual—a grand massive structure, Norman probably in part, but with early English windows, with tower in the centre.

"But I have one chief object before me—namely, to make inquiries about John Rose and his connection with Amesbury.

"I see that the little town lies pleasantly, that it has two streets wide and clean, and has a fair sprinkling of good houses in it. I halt at the principal inn, which with its archway and stable court has an old-posting-house look about it. I inquire at once of the landlord about the school, and am directed to a grammar school, being, I suppose, taken for a paterfamilias in search of a school for a young hopeful. But the schoolmaster's house has too modern a look. I ask, 'Is there no other school? Is there not an ancient building?' 'No, none.' 'Not one endowed by John Rose?' 'Yes, Rose's Charity: there it is on the other side of the street. A woman is entering the gates.' I follow, and instinct leads me on down the yard, and an open door reveals school desks and school appliances. The time is only half-past eight of the morning, so school has not yet begun, but at his desk sits the master, Mr. E. W. Flower, to whom I tell my errand. I find Mr. Flower ready to hear and ready to tell anything he knows about John Rose. I am very pleased to find the master of such a school properly enthusiastic about its founder. Very different have I sometimes found it, when the resident of an ancient house cared nothing whatever for its history. I produce a copy of last week's *Journal of Horticulture*, with in it No. 5 of "The Early Writers on English Gardening," and explain to Mr. Flower that what we have done for John Parkinson we wish to do for John Rose. Mr. Flower is also a horticulturist, and shows me several prize cards, evidences of his success. Here, then, I have the very man I want—a lover of a garden, and a devoted admirer of the founder of his school. Mr. Flower produces from his desk the deed of gift of the school and the orders and ordinances relating to it. In this document we see that John Rose was most anxious that the master of his school should be a good man; that the scholars should be well cared for in body, mind, and soul. No one reading the document could come to any other conclusion than that Rose was both a religious and a kindly man. John Rose's school was no doubt first kept in the south aisle of the church—i.e., inside the building, just as the famous Rev. Robert Walker of Seathwaite, mentioned by Wordsworth, kept his, and even used the communion table for his desk. Then it appears, so Mr. Flower informed me, that the school was kept in a cottage; then where the National School now is; and afterwards, as now,

where I found Mr. Flower. The house is in the principal street, one of the last on right-hand side. It is a red-brick unpretentious building, and was formerly an inn, down the yard of which, in what was once the coach-house, the school is now held, and a fair schoolroom it makes.

"In the churchyard there is a stone to the memory of William Cox, who died in 1849. He was the schoolmaster of Rose's school for fifty years—a man, as I was informed, to whom the youth of Amesbury owed much: indeed, he was a famous schoolmaster, whose memory is revered in the place.

"Having spoken of the school let me next speak of the man Rose. Mr. Flower introduced me to two local antiquaries—Mr. Edwards and Mr. Kemm, and all I could learn was that there has been a long-standing constant tradition at Amesbury that John Rose when a boy passed through the place on his way to London in a destitute condition, and that he was kindly treated by the inhabitants, and out of gratitude to them endowed the school. Amesbury is rich in residents who revere its history, and the two antiquaries I have named were enthusiastic with respect to John Rose, and were delighted to learn,

produce of the said estate over £30 per annum to be applied in maintaining a second school for teaching twenty children to read and repeat the Church catechism, the person keeping the latter school to be paid £21 per annum; and by order of the High Court of Chancery, whatever surplus money may remain is directed to be applied by the trustees in the payment of premiums for the apprenticeship of boys educated in the same school.

"I have noticed that the church was restored in 1853, at which time some alteration was made in regard to the communion plate, all which or part had been purchased with the £30 left by John Rose for that purpose. What the exact amount of the alteration is I do not quite know, but Mr. Kemm informed me that round the rim at the bottom of the foot of the present flagon is the following inscription:—'The silver alms plate was given to Amesbury church by John Rose, Esq., who died in 1677.' 'The silver remodelled 1853.'

The trust deed, in which the donor is described as "John Rose of St. Martins-in-the-Fields, gent.," is dated August the 7th, 1677, and from it the following is extracted:—"Forasmuch as God Almighty hath been pleased out of His infinite bounty to give so great a blessing to my honest labours and endeavours, as to lend me not only wherewithal to support me with the ordinary necessities of life but with an overplus of the goods of this life, I have held it my duty whilst I am alive, and before the said goods leave me, to separate a part of the same towards the education of poor children in the first rudiments of religion and learning." The deed directs that with the bishop's leave the school should be on the south side of the church, wherein was formerly a school kept. The scholars were to be "the poorest men's children of the parish of Amesbury," and the trustees he nominated were all his "beloved and trusty friends," eleven in number, all residing in the neighbourhood of Amesbury, and two of them occupiers of his two copyholds called Pandys and Battrees, and his two farms, all in the parish of Amesbury. He stringently provides that the schoolmaster shall be orthodox and of "honest life and good conversation," and able "to teach the grammar, fair writing, cyphering, and casting of accounts." The salary of the schoolmaster, £7 10s. quarterly, was to be paid out of the rents and profits of Rose's lands in Ditchet in the county of Somerset. Then follow directions for the removal of the schoolmaster in case of his evil conduct, and to provide for him if he becomes incapable after lengthened service. None of the twenty scholars were to be admitted unless they could read English and repeat from memory the catechism, nor remain scholars after the age of fifteen. Whilst they were scholars "the schoolmaster to have a care their faces and hands be washed, their heads polled, and their garments kept clean." If the lands yielded more than £80 a-year, the surplus was to be employed in providing a school to teach the poorest children reading and the catechism, and thus render them eligible for his grammar school.

I hoped that some record of Rose's birth might have been found in the Amesbury church register, but that hope is vain, for "WILTSHIRE RECTORS" informs me that the earliest register is dated 1654, at which time Rose must have been in the prime of manhood. However, he was a resident if not a native of the place, for Mr. Flower, the excellent master of Rose's school, has searched a record of the annual meetings of the trustees, and thus communicates the result:—"I met with the following entry, which, to my mind, proves most conclusively that he was an inhabitant if not a native of Amesbury: 'At a meeting (held September 29th, 1788) of the trustees of the Grammar School founded by John Rose, late of the parish of St. Martin-in-the-Fields, in the county of Middlesex, gentleman, deceased, formerly of Amesbury, aforesaid,' &c. I should mention also further that I met with the baptism of a child of the name of Rose, date about one hundred years ago, thereby showing that persons of that name (since the decease of John Rose) have been residents in Amesbury."—G.

Fig. 15.—John Rose.

what before they did not know, that an oil painting of him presenting the first English-grown Piss Apple to Charles II. was in existence, and that an engraving has appeared in this Journal.

"Unfortunately there is no record at Amesbury of Rose's birth or death; the former is not to be found at Ditchet, near Everescech, in Somersetshire, where Rose possessed property. Mr. Kemm had understood from his ancestors that Rose when a poor lad, on his leaving Amesbury, worked in the parish of St. Martins-in-the-Fields, London. I must add that the school is at Amesbury designated 'Rose's Grammar School,' and that a second school was established out of the proceeds of the charity, but on the death of the mistress some years ago it has been discontinued, and the salary formerly paid to the mistress now augments that of the master.

"Mr. Flower next takes me to the church, dedicated to the Virgin Mary, a lofty cruciform building, restored in 1853, chiefly, I believe, by the munificence of Sir Edmund Antrobus, Bart., of Amesbury Abbey, owned formerly by the Duke of Queensberry, the friend of Gay the poet, who spent much of his time here. It is a solidly and handsomely restored. At the west end is a table of endowments; that relative to Rose reads thus:—"John Rose by deed of gift dated 7th of August, 1677, vested an estate at Ditchet in the county of Somerset, consisting of a homestead and fifty-two acres, two roads, and thirty poles of land, in the hands of trustees for the perpetual endowment of a free grammar school in this parish for the instruction of twenty boys in grammar, writing, cyphering, and casting accounts. The master to be paid £7 10s. quarterly, and the

## HACKNESS HALL,

THE RESIDENCE OF SIR HARCOURT JOHNSTON, BART., M.P.

The village of Hackness is in a valley distinguished for its beautiful combination of woodland, hill, and water, for the Derwent flows along the valley. Hither retired Hilda, the foundress of Whitby Abbey, twelve hundred years since; and here probably William Rufus hawked, for the district was his. He granted a large portion to some of the Whitby monks, and their monastery in the time of Henry VIII. passed to the Hoby

family, and thence by marriage to the Sydenhams, who sold it in 1696 to John Vanden Bempde, Esq., whose daughter and sole heiress brought it by marriage to the family of the Johnstones, and the present mansion was erected by the first baronet of this family at the close of the last century.

The usual road taken in visiting Hackness Hall is along what is most inappropriately named Forge Valley, for few valleys of England are more beautiful, and now there is in it no forge. Its sides—beautifully wooded, but not so densely as to conceal the turf, wild flowers, and Ferns beneath—rise rapidly to a height of 800 feet; the Derwent flows beside the road, and on some of the turfey promontories of its windings were groups of pic-nickers and gatherers of wild Strawberries. The trees are mostly Beech, and towards the close of the valley near the Hall they are partly of the copper-coloured variety, and all of very large stature. That close of the valley is

superlatively beautiful, for the valley branches there, and peeping from among varied groups of varied trees, and widely apart on varied elevations, are the residences of the vicar, the steward, and the church, forming a combination that the pencil and not the pen can represent.

Having mentioned the wild flowers I will add that than in this vicinity nowhere are they to be found in greater profusion; of those of commonest occurrence I will only name the numerous species of Grasses and the Ladies' Bedstraw—the grey and purple flowers of the first and the yellow flowers of the other are in masses spread far and wide. Of the rarer species I gathered the Lesser Twayblade (*Ophrys cordata*) and the Nettle-leaved Bellflower (*Campanula trachelium*), the latter towering at intervals above all the others, and its fine delicate pale blue flowers rendering it aristocratic-looking among its humbler-statured companions. Prominent among these was

Fig. 16.—HACKNESS HALL.

*Geranium sylvaticum*, a northern perennial found from the midland counties northward until it reaches 2700 of elevation in the Highlands. On the moors near in one or two very restricted localities is found the rarer *Cornus suecica*.

Mr. Sowerby met me courteously at the gate admitting from the road to the kitchen garden, which is of four acres extent, and enclosed by a 12-foot wall. On these are Plums, Cherries, Apples, and Pears. Even the Nonpareil requires the wall. Of Pears Mr. Sowerby finds the Glout Morceau and Crasanne the most certain croppers, but the Jargonelle very uncertain, and the Van Mons productive but almost worthless. There are seven small lean-to Vine and Peach houses, and the crops were very abundant and healthy. Mr. Sowerby thins the bunches of Grapes very freely, and the berries are proportionately large. There is no early forcing, for the family are away until August, and for the early months of the year the late-keeping of the Lady Downes' is relied upon. The other varieties of Grapes are Muscadines, Black Frontignan, and Muscat of Alexandria. The crops of the Peach Royal George and Nectarine Violet Hâtive are excellent. One of the houses is devoted to flowering plants, Ferns, and fine-foliated plants for the house decoration. Another house is devoted to wintering bedding plants, and its entire roof is covered with *Stephanotis floribunda*, most profuse of flowers when I was there. The kitchen garden was well cropped, and on the walk-borders

were espaliers and dwarf standards of Apples, the boisterous winds sweeping the valley forbidding full standards.

From the kitchen garden we passed under a densely-foliated arched pathway to the lawn before the south-west front of the Hall. That arched pathway reminded me of one possessed in former years by my family, and which the gardener, quite innocent of punning, called "the subterranean path."

The lawn occupies six acres and there is no other dressed ground, nor is any more needed, for it is most beautiful. In whichever direction you look there is a foreground of bright turf enamelled with beds, mostly circular, filled some with Roses trained over their surface, others with Geraniums, and others with bedding plants such as Golden Pyrethrum, *Alternanthera*, with Lobelia and Sedums for edgings. Then, there are large rustic baskets filled with Geraniums and elevated on rustic pedestals, and Roses grouped and trained to stakes so as to form pillars about 5 feet high. This foreground is enclosed by groups of trees, there are no continuous lines, Weeping Limes, noble Beeches, and Conifers all fine and feathered to the ground. Among them I noted an *Abies Douglasii* 50 feet high though only forty years old. Over these groups of trees, for the mansion is on a very elevated site, the eye looks upon the river Derwent in the valley below, and over a tract of richly wooded country to an horizon many miles distant.

The prospect to the mansion's right including the church in

the near distance is very rich and varied, and its lofty and slender spire well relieves the rounded outlines of the trees around it. Many are the monuments within the church I would willingly dwell upon, especially that graceful group by Chantry, of the dying wife and her kneeling husband, grief-subdued and with face judiciously hidden, leaving to the imagination the sorrow of its expression. More than one poet has celebrated the beauties of this place, but space can be spared for only two verses, which I select because unexaggerated:—

"Ah! what enchantment Nature's hand supplies  
What witching scenery decks this blissful retreat  
What headlands green, and promontories rise,  
Of old patriarch Oaks the favourite seat!

Go, climb the heights, when clad in twilight grey,  
The soft still moon pulls off the veil of night;  
Thence, all these valley-dimpled plains survey,  
These beaked hills with waving foliage dight,  
Yon beauteous spire, the heath-impurpled moor,  
And ocean slumbering on the distant shore."

—G.

### SHIFTING GREENHOUSE PLANTS WITHOUT INCREASING THE SIZE OF THE POTS.

PROBABLY others of your readers besides the writer have found it desirable, and perfectly practical, to shift many of their greenhouse and stove plants annually, or every two or three years, without giving them more pot room—though I believe it is the usual practice to shift on, until both plants and roots are of unwieldy size. This practice is so far necessary in growing large specimens; but it is followed in not a few cases, I imagine, through timidity to reduce the roots of the plants sufficiently: and so such things as Azaleas, Heaths, Genistas, Acacias, &c., soon get too large for general use, and in the end have to be thrown away to make room for younger stock.

Here, the most of our plants of this kind are employed in house-furnishing, and having large numbers of small single vases in corners to fill with pot-plants; and not wanting to turn the plants out of the pots any time they are used, we try to keep them all in suitable-sized pots, that will just fit; and wishing to keep the old plants on as long as possible without increasing the stock, we have to deal with them in a summary manner in potting. Some of our Genistas, for instance, have been in the same 7-inch pots for six or seven years, and look as if they would keep their health and vigour under the same conditions for twenty years or longer. They are about 8 feet high when in flower, and 2 feet fully through at the base. The health of the plants is all we could desire, and they always flower most profusely.

The plants have just been clipped-down with a pair of hedge-shears to the diameter of the pot, and shifted—that is, they have been turned out, and had about 2 inches cut clean off the bottom of the ball, not including the drainage, and 1 inch sliced off all round, and put back into the same size of pot again. Had it suited our purpose, no doubt we could have had the plants twice their present size or more without increasing the size of the pot. Some dozens of Azaleas in 5 and 6-inch pots have been treated the same way, also Acacias and other plants. Plants so treated experience no greater check, I think, than if the balls had only been slightly loosened round the sides in the usual way. The knife makes a clean cut, and the solid piece of ball left in the centre seems to be quite sufficient to sustain the plant in a healthy state till it makes fresh roots. We have not operated so extensively on Heaths in this way, but have sliced pot-bound plants of Hyemalis and others without apparent injury, as the plants made their usual growths.—S. W. (in *The Gardener*).

**EARLY SEEDLING PEAR.**—A correspondent from Mount Airey near Philadelphia, under date of July 17th, sends us the following, says the "Gardener's Monthly":—"I send you herewith a branch of a Pear tree with ripe fruit, a seedling from the Seckel, the seed having been planted, and the tree grown on my place. The quality of the fruit is only fair, but coming in a few days earlier than any other variety, I think it has some value. You will notice that the foliage, and the growth of the fruit in clusters, resemble somewhat the Seckel."

[This is before the Doyenné d'Été, Dearborn's Seedling, or any early Pear we know. The flavour is but second-class, but on account of its early ripening it would be valuable as a

market fruit, where early Pears for stewing are always in demand.—Ed. *American G. M.*]

### NOTES AND GLEANINGS.

**LADY ASHBURTON'S STOVE AND GREENHOUSE PLANTS**, removed from Melchet Court, near Romsey, were sold on the 28th ult. by Mr. Stevens at his rooms in King Street. There were 268 lots. The following were some of the prices realised:—*Lælia anceps*, £11 11s.; *Oncidium concolor*, £15; *Lælia elegans* Turneri, £48 6s.; *Phalenopsis Schilleriana*, £38 12s.; *Cypripedium caudatum*, £16 16s.; *Anthurium Scherzerianum*, £32 11s. These were all very superior specimens.

THE annual meeting of the PELARGONIUM SOCIETY was held on the 22nd of July, on which occasion the members present dined together at the "Criterion." The Treasurer, Dr. Denny, was able to report a healthy state of the finances, a balance of £20 8s. 4d. remaining after paying the prizes awarded at the exhibition on the previous day, and all the working expenses. The sum paid out in prizes was £40. A hope was expressed that the Society, now that it had become better known, might draw around it more abundant support, so that encouragement might be extended to other classes of Pelargoniums besides the Zonals, which was the class specially in view when the Society was originally founded. It was also thought that the inducements offered by the Society might set hybridisers to work, and so be the means of obtaining new types of this useful decorative family. The Chairman, Treasurer, Hon. Secretary, and Committee were re-elected, the latter body being strengthened by the addition of the names of Mr. Andrew Henderson, Mr. G. T. Rollison, Mr. B. S. Williams, and Mr. J. F. West. A very pleasant evening was spent, in the course of which a most interesting discussion took place as to the influence of the pollen in cross-breeding and on other matters connected with the history and improvement of the Pelargonium. Mr. Pearson suggested that the Society should endeavour to find and to fix satisfactory and intelligible names for the different groups of Pelargoniums, instead of the inapplicable ones—Show, Fancy, Tricolor, Zonal, &c.—now in common use. In reference to the origin of the Fancy Pelargonium Mr. Cooling stated his belief that the first variety of this type, which must have been raised forty years ago, was one called Willoughbyanum, and that it had been bred from the ordinary varieties of that period crossed with such sorts as Moore's Victory, Fair Helen, &c., Willoughbyanum being one of the seedlings thus produced. Mr. Williams urged that the objects of the Society were too restricted, and that other flowers should be included; but this objection was met by the argument that to extend the scope of the operations would require more funds, and would create a divided interest, whereas it was better for the Society to concentrate its present efforts on the flower which had been selected, and that other elements would be found in the Show with which that of this Society would always be associated—that of the Royal Horticultural Society for example, as was the case this year.

UNDER date of August 2nd Mr. Mowbray, gardener to Viscount Kirkcaldy, Fulmer, Slough, writes, "The POTATO DISEASE is spreading very much around here. I find this day three peeks out of four bad, and I fear the damage will be extensive. The disease appears to be very virulent indeed in its nature."

Messrs. Hooper & Co. write to say that the probability of a prevalence of the Potato disease this autumn, and of the early decay of the haulm, leads them to believe that it will be in the interest of competitors to AWARD THE PRIZES AT AN EARLIER DATE than has been fixed—viz., November 10th. This change, however, must be contingent upon the consent of all the competitors, and they therefore request the favour of their stating whether it will be agreeable and convenient that the adjudication shall take place some time in the month of September or thereabouts, instead of November.

### NOTES ON VILLA AND SUBURBAN GARDENING.

**THE CHINESE PRIMULA.**—This being such a useful decorative plant I may be excused for once more calling attention to it, especially as the most simply contrived place can afford a home for this excellent plant. I shall presume—and no doubt shall be nearly right—that most of those who intend to grow it have already their plants up and pricked-off into pots or pans; and if that should be so, and they have made five or six small leaves

it will be proper to divide the plants carefully, and let each one occupy a small pot, being careful that the soil in this stage is not too strong; two-thirds fine loam and the remainder of leaf mould and sand is a suitable compost. After this is done replace them in the frame where they were first raised, and let them establish themselves. By no means does the *Primula* need that amount of heat that many persons feel inclined to give it; too much heat conduces to weakly-constituted plants.

A cool frame is one of the best places for these plants after they have established themselves at the stage stated above. They do not need much sun, but they should have all the light that can otherwise be allowed them. A free circulation of air about the plants is necessary, and in the summer months if the frame is hoisted on bricks, and the air allowed to pass under as well as above the plants, it will induce them to become stout and sturdy in their growth. The plants should be elevated so as to be as near the glass as is consistent with the conditions of growth, and allowing at all times room for the development of leaf and stem, which is so essential to all plants that are required to flower at so dull a period as the *Primula*.

Now the *Primula*, which is one of the best of plants for an amateur to grow, must not be starved, but should be grown in a generous way, and it will well repay the cultivator by its massive blooms. There are very few bad strains of this class of plants about, so that if grown well the individual flowers come very fine.

Nobody can grow *Primulas* in a cold damp house, and where they are perhaps overshadowed by large plants, and have neither sufficient light nor air. Great care, too, is necessary in the watering, which should be done as early in the day as possible, adapting the quantity to the requirements of the plant and the surrounding atmosphere. Guard against the soil becoming too wet and perhaps soddened, for if this often occurs, and for any length of time, the plants will become sickly and die-off.

There are many semi-double and double forms of the *Primula* in cultivation which are worth growing, as they last in bloom a long time. They are increased by cuttings; therefore those who undertake their cultivation should secure a well-established plant at the first. Drain the pots well, and use a soil composed of good turfy loam, leaf mould of the purest character, and a little old and well-rotted cow manure, with sand and charcoal added. Do not give them large shifts, and let them only be potted when the roots are fairly working at the outside of the ball of soil. The plants like plenty of light, but shaded from the full sun, as a dry parching atmosphere is injurious to them. Water must be given carefully. In hot weather in summer a cool north aspect is suitable to the plants, and they may be freely ventilated. These are the principal points in their culture, which if attended to will bring the plants in good health and vigour, and will bloom freely throughout the winter months. Be sure that in winter they have all the light possible, and to be very cautiously watered at that season.—T. RACORD.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### KITCHEN GARDEN.

ALL around us the farmers are digging their Potatoes and sending them to market. The progress of the disease suggests the propriety of sending them off as speedily as possible; this is being done, and the result is that £4 to £4 10s. per ton is only being realised for the best produce. Added to this low figure it must be noted that in some instances there is not more than half a crop from the attack of "curl" early in the season; numerous diseased tubers are also found, and a very large proportion have the white speck on them—always a sure forerunner of the disease. We have not found any symptoms of it in the garden as yet, but this is attributed to the dry borders in which the Potatoes are growing. The tubers intended for plants next season have been stored in a dry loft spread out thinly on the floor.

We do not usually save any of our own vegetable seeds, leaving this work to the seedsmen, who can do it much cheaper and better; but the new system of sending out the new Peas at 60s. a quart instead of 5s. as formerly has driven us to do a little of it. With care a packet containing a quarter of a pint gives us about three quarts of Peas, which is quite sufficient for the usual sowings of any new sort for the following season. The pods are gathered as they ripen, and are spread out in a dry place until the Peas are quite hard in the pod, when they are stored away in bags, or, what is better, tins; the preference being given to the latter, as the mice are apt to gnaw the bags, either paper or cloth, into holes.

We have taken advantage of the rains to put out the Strawberry plants; of course the ground was first trenched and well manured, as we have previously described. A hole is also taken out for the plant large enough to allow of some good loam being put in. This would not be necessary on good Strawberry soil, but in our light soil it is. The plants which have been previously layered in small pots are then put out in a shallow depression, to

allow of watering them if necessary. One would have thought that the continuous wet, followed by heavy falls of dew every night since, would have kept off red spider; but it has not done so, and the plants have been plunged overhead in soapy water. The weather being now fine, and the ground from the effects of rain having been surface-hardened, it was quite necessary to run the hoe over all borders and amongst growing crops.

We plant Sprouting Broccoli on vacant ground, and it is now a good time to plant vegetables of this description for winter and spring crops. Broccoli should be planted out on the beds from which the old Strawberry plants have been removed. Celery for the latest use should now be planted out. See that this crop does not suffer for want of water, but this may be overdone, especially on heavy soils, if the drainage is deficient.

### PINEAPPLES.

We cannot add much to the remarks in the "Doings" of the last two numbers under this heading, but it may just be hinted that those who have not yet potted their suckers should see to it at once. In fruiting houses, especially where only a small number of plants are grown, the aim of the gardener is to produce certain fruit at the time they are required. Sometimes Queens are stubborn and will not change at the time they are expected to do so, at another time they will not keep in good condition. We find ripe fruit keeps a long time if placed in a dry cool room; and to hasten the ripening one gardener of considerable experience pulls the plant out of the pot after the fruit has begun to swell, shakes nearly all the mould from the roots, and repots the plant in a small pot. This would certainly accomplish the end in view, but the fruit could not possibly be of such good quality; indeed, all fruit ripened hurriedly, whatever the means used, is never of such good quality as that ripened with the treatment best adapted to it.

### PLANT STOVE AND ORCHID HOUSES.

As all hardwooded plants are now maturing the wood, it is desirable that they should be as fully exposed to the sun as the leaves will stand without injury. In many gardens, and even those of considerable size, there is one house devoted to flowering and foliage plants, a miscellaneous collection of Orchids, or indeed any plant that is too tender for the greenhouse. It is not possible under such circumstances to do justice to all. Some plants require all the sun they can have at this season, others would be much injured by it; so a compromise is made. The house is not shaded enough for some plants and too much for others, and none of them receive the treatment they ought to have, and yet employers may fancy that their gardeners ought to rival the fine plants shown by people who make a specialty of them at the different exhibitions.

Hardwooded plants, such as *Ixoras*, *Gardenias*, *Stephanotis*, *Dipladenias*, and plants of this character ought to be removed to a house where they can have more light and air. In very hot weather it is quite as well to shade for an hour before and two hours after noon. We find room in the Pine houses for them, but they are not admitted unless they are quite free from bug. The plants are thoroughly syringed at least twice a-day. It is also a good time to put in cuttings of the hardwooded plants; the half-ripened wood if taken off at a joint, and the cuttings inserted in sand, and the pots placed under bell or hand-glasses, will root in time. Some species take much longer to do it than others.

Palms are subject to the attacks of red spider; if the leaves are not syringed daily this pest is certain to attack them. It must be sponged off, and the plants syringed daily afterwards. The Cocoa-nut Palm (*Cocos nucifera*), and the more slender-growing *Chamedores graminifolia*, are peculiarly subject to it. Any Orchids that have not been repotted or placed in fresh baskets ought now to be done. Many of the species that are grown in pots are apt to become sour at the roots, and decay sets in. A good plan is to wash the plant out of this unsuitable material, and to repot it in clean crocks only. Orchids during the growing season require plentiful supplies of water on the roots, and if the pot or basket contains peat or sphagnum in a state of partial decay this is certain to be destructive; it is not the nature of the roots to take up moisture from such a source, and they soon suffer in consequence. We have seen *Aërides* and *Vandas* turned out of large pots, and the only sound roots were those thrown out above the potting material. Our plan with this class now is to plant in potsherds entirely, with just an inch or so of live sphagnum on the surface. The roots thrive in this if there is no decaying organic matter underneath. The sphagnum should be kept in a healthy growing condition.

### FLOWER GARDEN.

*Verbenas*, *Pelargoniums*, *Calceolarias*, and other fragile flowers looked very seedy during the rains, but they are now flowering freely; the withered trusses and flower-stalks require to be removed, and all weeds have been picked off by hand. *Tricolor* and *Bicolor Pelargoniums* that have been planted for leaf-effect must have the flowers removed, or the arrangement of colours may be interfered with. *Lady Cullum* is exceedingly effective this season, and *Bright Star* of the silver bicolor class holds the highest position; the white is exceedingly pure. Our bedding

Zenals comprise old favourites that have done good service for many years. One often hears of the excellent qualities of the new varieties, but they come in such crowds that it is quite impossible to purchase all, and according to the vendor's description all of them have superior qualities. We still grow Amy Hogg and Christine for pink, Vesuvius for scarlet, and of crimson shades Stella and Wellington. It is not a long list, but they answer our purpose very well.

Phloxes are now in fine flower, the spikes are very strong; they are from two-year-old plants, the delicious perfume is wafted a considerable distance from the beds. A rich soil and plenty of water during the growing season is all the treatment they require beyond tying the spikes to a stout stick. Have been layering Carnations and Picotees. Nearly all our collection has been grown in pots, and as the flowers open they are removed to the greenhouse to protect them from the weather, but as soon as the flowers are over it is best to remove the plants outside again, as the "grass" becomes drawn up weakly; the surface soil in the pots is removed, and some sandy loam put in its place, in which the layers are pegged down. We have also tried to propagate some of the sorts from cuttings, but to be successful with them they ought to be put in about the latter end of June. It is then necessary to mark them with a corresponding mark on the plant from which they have been taken, as the flowers may be "run," when the plants from it would be worthless. Pippings strike best in a close frame under a north wall.

Auricles are now starting into growth, and it is necessary to remove all decaying leaves, which if allowed to remain sometimes taint the stem and lay the seeds of decay. Our plants were potted in June, but those who have not yet repotted their plants should lose no time in doing so. Pinks have rooted freely in boxes, and will be planted-out in some fine soil some time during this month to be transferred to the beds in October.

We are also budding Roses: this is interesting work for amateurs, and unless the weather be dull it is best performed in the cool of the evening. If the Manetti stock is used the buds should be inserted close to the ground. The same advice may be followed with the seedling Briar. Standards are budded on the young shoots that spring from the stem; the buds ought to be inserted quite close to the base. A spud ought to be always at hand to remove all suckers as soon as they are perceived; it is sometimes necessary to remove the soil so that the sucker may be wrenched out at the heel. Manetti suckers are not unfrequently mistaken by the inexperienced for growths from the Rose, and these are pruned and treated as the stems of the Rose itself. When this is the case the Rose will die out in two years, and nothing but Manetti remain. This we have seen where half a dozen young gardeners were kept.—J. DOUGLAS.

### TRADE CATALOGUE RECEIVED.

Louis Van Houtte, Royal Nurseries, Ghent, Belgium.—*Catalogue of Bulbs and other Flower Roots.*

### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

OTLEY.—August 7th. Mr. Jno. Lee, Hon.-Sec.

ROSEDALE-NEWCHURCH.—August 7th. Mr. M. J. Lonsdale, Newchurch, Sec.

LITTLEOVER (near Derby).—August 7th. Mr. B. Toft, Hon.-Sec.

CANTERBURY.—August 13th.

NATIONAL CARNATION AND PICOTEES SOCIETY.—August 18th and 14th, in Manchester Botanic Gardens. Rev. F. D. Horner, Kirkby Malsard, Hon.-Sec.

BURNOPFIELD.—August 14th. Mr. J. Hood, Sec.

LEAM.—August 14th. Mr. H. N. Illingworth, Sec.

CARTMEL, NORTH LANCASHIRE.—August 14th. Mr. W. Cragg, Hon.-Sec. COVENTRY (at Coombe Abbey).—August 17th. Mr. T. Wigston, 8, Portland Terrace, Sec.

DOVER.—August 18th.

NORTHLEACH.—August 18th. Mr. J. Walker, Hon.-Sec.

CHARD.—August 18th. Mr. T. L. Brown, Hon.-Sec.

EASTBOURN.—In the Devonshire Park.—August 19th. H. A. E. Bumble, Esq., 26, Hyde Gardens, Sec.

NIXON AND WHITWELL.—September 2nd. Mr. E. W. Berry, Hon.-Sec.

### TO CORRESPONDENTS.

\* \* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

HEATING BY PARAFFIN OIL (R. F.).—We do not see that your mode differs from others in which gas has been employed for heating. When you have proved that a paraffin lamp will give out sufficient heat to exclude frost we shall be pleased to hear from you again.

BEGONIA SEEDLINGS (Inquirer).—The flowers were quite withered.

POTATOES BEGINNING TO BE DISEASED (H. B. E.).—Take the crop up immediately, and store them in a cold dry out-house in layers alternately with sand. If you had taken them up in mid-July they would not have been diseased.

SPONARIA CALABRICA FAHLENG (J. H.).—We are unable in the absence of any particulars to assign a cause or remedy, it probably having been destroyed by the "white" grub you have found at the roots.

KEEPING CUCUMBERS AND VEGETABLE MARROWS (F. J.).—Beyond keeping Cucumbers in a pickled state, and Vegetable Marrows in the ripe form, we do not know of a mode of preserving them for a few months in a useable state.

SEEDLING FIG (J. H.).—The leaf is very deeply lobed and dissimilar in formation from any we are acquainted with. It is likely the tree would fruit were it planted-out against a south wall, or more certainly were it grown in a large pot and under glass, especially as it is now showing fruit at "every point." By all means ascertain what the fruit is before you discard it or increase it.

CUTTING-BACK LAUREL HEDGE (H. T.).—Defer the cutting-in until the close of March or the early part of April, and you may then cut-in the branches, old or young, to the extent required with every chance of their putting-out young shoots freely. Go over the growths early in August, and cut-in any irregularities.

THRIPS ON PLATYLOMA CORDIFOLIA (Constant Reader).—The frond sent us is infested with thrips, which causes the whiteness of which you complain by the insects destroying the tissues. This Fern and the other you name—viz., *Cyatium falcatum*, are very subject to attacks of thrips. Fumigation with tobacco is the best remedy, which to be effectual should be repeated on two consecutive evenings, and again in a week, and again whenever an insect is seen. If only these plants are infested the plants may be freed by a wet sponge, or the fronds immersed in tobacco water, which may be made by pouring boiling water upon the strongest shag tobacco—1 oz. to every half gallon of water. When cool it is fit for use. Excepting young plants and those in very small pots growing freely we do not advise Ferns to be potted at this time of the year, though it may be done satisfactorily with pot-bound plants.

CONSTRUCTING FORCING PIT (Amateur).—A low span-roofed one is most suitable for a majority of plants, and having a walk up the centre with about 4 feet width on both sides for plants. One side we should have a bed with hot-water pipes—i.e., two 4-inch pipes in the 4-feet width for affording bottom heat to such plants as may require it, for striking cuttings or for affording bottom heat to Cucumbers or Melons, whichever you may use the pit for when not employed for forcing. The walls we should have 4 feet high, and you may have 2-feet side lights, and the pit about 10 feet high in the centre from the floor to the ridge. The side lights should be made to open the entire length on one side, or better every other light on opposite sides, and lights of 2-feet width the entire length of the pit on one side of the ridge, and to open by cranks and lever, also the side lights. In addition to the two pipes for bottom heat you will require two on the same side for top heat, and also two on the opposite side, which we should have beneath the shelf on that side. Over the walk you may have a shelf, which will be very useful for dwarf plants or Strawberries, and under the stage you may force Sea-kale and Rhubarb, the former being covered-up so as to blanch the growths. The length of the pit may be what you wish.

LILYUM FOR OUTDOOR CULTURE (An Amateur).—The culture of Lilyums in the open border is very simple, they only requiring to be planted about 4 inches deep in rich, deep, well-drained soil, adding to the soil peat or leaf soil or both, with a liberal dressing of dung and sand, the latter in goodly quantity if the soil be heavy. A few kinds suitable for the open borders are—*L. Browni*, *bulbiferum*, *candidum*, *colchicum*, *chalcodictum*, *longiflorum*, *martagon*, *pulehallum*, *superbum*, *tenniflorum*, *tigrinum*, and *tigrinum splendens*. Both *L. auratum* and *L. lancifolium* var. *eximium* well outdoors in all but very cold situations.

GOOD AND CHEAP GLADIOLI (Idem).—Oracle, Flavia, Queen Victoria, Emile, Eurydice, Félicien David, Sir William Hooker, Le Titien, Milton, Racine, Lord Byron, and Stephanoen.

VINES UNFRUITFUL (Old Subscriber).—The time you name, 9 o'clock, for giving air, is not early enough, and is sufficient to account for the scorched leaf sent us. A little air should be left on all night whatever the weather may be, and it should be increased when the thermometer indicates 78°, which certainly will be attained before nine, and air admitted as occasion requires to prevent the temperature rising above 80° to 85° without full air, and it should be reduced at 80°, and at 78° the house closed, with the exception of little air left on constantly, which will prevent scorching of the leaves or scalding of the berries. The side shoots, if so thick as you describe, will be sufficient to account for the unfruitfulness; reduce them at once to 15 inches apart on each side of the rod. Stop the shoots at the sixth leaf, which will keep the shoots and leaves from overlapping; no leaves other than those removed by stopping or removing laterals to be interfered with. The charged refuse may be obtained by making a fire and placing upon it any refuse you may have at command, as garden refuse, trimmings of trees, rough suits of grass with some soil adhering, taking care that it only

smoulder, and not blaze or break through, covering it with the sods you propose using, which will do them no harm but good, and when it is charred through put out the fire. The top 8 inches of the pasture, not the "top spit," will be suitable for the border. The manure for the border should be half-decayed, or better fresh, with all the straws practicable removed. There is no need to thatch the border, a covering of leaves and littery manure may be given to protect the roots from frost, the littery part being removed in April and the short left.

**POTATO DISEASE—INSECTS** (H. N. O. Mallow).—The black ova sent have certainly not the slightest connection with the Potato disease. Their presence on the Potato root is accidental.—L. O. W.

**ACALIAS MAKING FRESH GROWTH** (T. W. L.).—Whilst making fresh growth, and until that is complete and the buds formed, they require to be kept close and moist. A temperature of 60° to 65° at night, and 70° to 75° by day, with a rise from sun heat to 80° or 90°, air being admitted moderately, and the plants shaded from bright sun. The pit would be more suitable for the plants than a greenhouse until the growth is made and the buds set, after which they should have air more freely, and the shading be gradually withdrawn. When hardened off they are best in an airy house, and shaded from bright sun.

**GLASS FOR CAMPELLIA HOUSE** (Solo).—Rough plate glass a quarter of an inch thick would do away with the necessity for shading; or plate glass ground on one side answers perfectly, the ground side being placed inside, and the smooth or unground side outside. If the roof be already glazed with clear glass you may give an efficient shading by painting the inside with a wash formed of skim milk and whitening of the consistency of whitewash. It will last good until the close of September, after which it may be washed off, shading not being required in winter.

**POPPIES** (A Lady in Cheshire).—There is a number of herbaceous kinds, but none corresponding to the one you describe. The Great Scarlet Poppy (*Papaver bracteatum*), with flowers 9 inches across, is grand; and so is the Iceland Poppy (*P. nudicaule*), with yellow flowers; but there is no perennial with the flowers approaching your description. It must be an annual, and its appearing twice in the same border and place two years consecutively is no proof of its perennial character, as they produce themselves very freely from self-sown seeds. It is not usual for them to appear year after year. We have known a bed of French Poppies reproduce itself for a number of years, and the identical kind you name we have had year after year, in a plot of Seakale the last year, and not a plant in the time has been allowed to seed; hence they have arisen from seed previously existent in the soil in a dormant state. It is the Peony-flowered, which you may obtain in ten colours. The Carnation Poppy may be had in twelve colours, treating them as hardy annuals. Fine indeed are such plants for shrubbery and herbaceous borders.

**DOUBLE PYRETHRUMS** (J. B. Nottingham).—Propagation is effected by division of the plants when they are beginning to grow, each slip or division being removed with a portion of root and planted in a shady border of light soil, and watered well established. More generally, however, cuttings are made of the growing shoots, and especially those situated at the base of the plants, having two or three joints, and inserting two-thirds the length of the cuttings in sandy soil in a shady border, and covering with a handglass.

**BEDDING GERANIUMS** (F. J.).—Inserting the cuttings in large pots half filled with compost is a novel idea, and beyond that has nothing to recommend it. Four to six cuttings may be wintered quite well in a 44-inch pot, potting them off singly in March. Better than pots where room is an object is to insert the cuttings in boxes, and 1½ inch to 2 inches apart, potting-off in February if you have heat, in March without it. Very good plants may be had either way, and very little inferior to those grown during the winter in pots singly.

**WASPS' NEST UNDER ROOM-FLOOR** (A. B.).—If you cannot reach the wasps' nest under the floor of your dining-room to destroy it by burning or otherwise, your plan of closing the gratings by which they enter, and thus starve them to death, is the only which we think can be safely resorted to. Prevent them from getting food outside and they will perish.

**INSECTS** (Lettice).—We think it very unlikely that you will be able to keep your south-of-England Glow-worms alive and breed them in Co. Antrim, Ireland. They feed on snails, slugs, and small worms.—L. O. W. We should put them in a garden and leave them to their own instincts.

**NAMES OF TREES** (O. W. M.).—The large leaf is the Variegated Sycamore (*Acer pseudo-platanus albo-variegatum*). The other is also an *Acer*, probably *Opulus*, but a smeared leaf is not sufficient to enable us to identify it correctly.

**NAMES OF FRUITS** (J. P. Allan).—It is the Flemish Cherry.

**NAMES OF PLANTS** (D.).—1, *Limonanthus Douglasii*; 2, Too withered (*J. W. L.*).—*Thalictrosum aquilegifolium*. (*A. Z.*).—1, *Lonicera japonica*; 2, *Sedum Sieboldii*; 3, Too shrivelled; 4, *Achimenes* sp. (*E. J. S.*).—1, *Polypodium aureum* var. *aristatum*; 3, *P. appendiculatum*; 4, *P. (Goniophlebium) subauriculatum*; 2, *Salagheia cuspata*; 5, *Pteris quadricarita*; 6, *Asplenium bulbiferum*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### LES BASSES-COURS DE L'ANGLETERRE.

#### CHAPTER 2.—FAVERSHAM.

44, PRESTON STREET, this time is our destination, and close to the station we found it. How we envied Mr. Dring who can throw a stone almost into the parcels office. We who have to go close on two leagues to send off a basket of eggs or fetch a bird from the station, certainly did wish we were a little nearer when we saw how conveniently our friend was situated.

Mr. Dring is an old friend of ours. He was almost the first friend in the fancy we ever knew, and though that was close on half a score of years ago, we never were able somehow to see the Houdans and Crève-Cœurs in their own Kentish home till we planned this visit. Mr. Dring is most assuredly one of those who does wonders in a small place. Those who see his name at

show after show winning cups and prizes can have no conception that only a back garden and an enclosed yard are his poultry premises. Surely if they did they would cry, "Let us go and do likewise," for certainly Mr. Dring holds a proud and prominent place in the poultry world arena.

A right hearty welcome we found awaiting us from both Mr. and Mrs. Dring, for Mrs. Dring is as "far gone" as her husband; in fact, Mr. Dring is proud to be able to tell everyone that a great part of his success is due to his good lady. When he is away amid the barrels of sparkling bitter beer, brewed from the finest East Kent hops, she is feeding the "coming K's" on every conceivable kind of tit-bit, or making some dainty dish for a promising brood of early chickens, or administering minute and frequent doses of "paste" to a Crève cook who is off his feed, or chopping-up green meat—making savoury salads in fact for the growing birds. Yes, Mrs. Dring is an enthusiastic fancier, and a knowing one. We heard once how she saw a Houdan cock in a far distant farm homestead, and quickly detecting its merits took home the trophy to her husband, which went afterwards the round of the shows, bringing in first prizes and cups *ad libitum*. Mrs. Dring on this occasion, too, was up to the mark, for she first found its pedigree, and so knew she would be in no way sulling the fair honour of the birds she had left behind her. All these things does Mr. Dring's good lady do. At the Palace she is as well known as he is, for basket in hand she goes round distributing chickweed and watercress, not only to their own birds but to any she sees in need of it. Truly a thorough fancier is Mrs. Dring!

44, Preston Street, is a corner house in the street. It has behind it what would be an ordinary-sized town garden. In the centre of this is a piece of green, and round it are the runs. The garden plots have long ago gone, they melted one by one into the chicken runs as the fever grew fiercer, and when we went there it was all "establishment." The houses and yards were as clean as this paper. They were a treat to see, and, of course, this is a great reason why Mr. and Mrs. Dring are so successful. We saw champion Houdans and Crève cooks in little houses, who took turns for a promenade on the garden green. The water for them was clear, their houses all sanded down with clean sparkling sand and pounded sea shells. We saw a long run going down two sides of the garden almost full of Crève hens. There were winners there at all the best shows. We noticed one pair especially, perfect beauties, huge in crest, black as jet, and with bodies like brave Coloured Dorking hens. They matched so well it seemed a pity to send them out separately. Every foot of space in this garden was made the most of. We even saw a trio of cockerels living in the summer house. This was evidently the last place given up to the birds, and we can imagine even our enthusiastic friend here giving a shiver as he saw his smoking snuggerly also given-up to the Frenchmen. We next crossed a road close to the house and found a garden which Mr. Dring hires, this was also wholly given up to the birds. The houses here were large and commodious and scrupulously clean. The runs were a fair size, and were covered nearly over with broken and pounded sea shells, and the birds seemed to thrive marvellously in them. There were birds put-up for breeding when we saw them in two of them, and the others were full of cockerels and pullets ready for the show-pen or the purchaser. We noticed one or two white birds which looked very striking among the coloured. These were bred from perfect winning specimens, and afford another instance of how the truest-feathered birds throw chickens different in plumage to themselves.

When we went indoors we were regaled on cold boiled Houdans, and delicious it was. If it ever comes to our lot to breed birds for the table we shall give Houdans the first turn. We never remember eating chickens with such delicate meat or of such fine flavour. Mr. Dring showed us, too, his cups—and a beautiful collection they were—each one looking as bright as if it had that moment been turned out of Elington's. We were, as old friends, privileged persons, for we were shown the account book; and though we will not divulge one line of that well-kept ledger, still we must say we were amazed to see how little Mr. Dring asks for his winning and stock birds. Really the birds seemed to us to be given away; but Mr. Dring assures us he finds it by far the best way to sell a good bird at a fair price, for the same customers then keep coming again. And certainly time after time we saw in that ledger the name of the same purchaser occurring, and that being, too, of a well-known exhibitor; so we are inclined to think Mr. Dring's method of dealing a good one.

Mr. Dring is fortunate in having a friend near him who lives in the country, and who frequently allows a few birds to be sent to him for fresh country air. This must be a great boon, for when a bird droops or ails from any cause nothing affords such a good "pick-me-up" as a run in a rich country field; and we can imagine even that Mr. Dring has often cause to thank his friend in the country for some small portion of his successes.

When we left, our worthy host drove us to Ashford, and the drive was most beautiful, passing the famous Eastwell Park with its fine undulating grounds. We carried away the recol-

lection of a most happy time, and were delighted to have had the opportunity of seeing our old friend's French people on their own dunghills.—W.

## BATH, WEST OF ENGLAND, AND SOUTHERN COUNTIES SOCIETY.

THE usual Council Meeting of this Society was held at the Grand Hotel, Bristol, on July 27th.

THE CROYDON MEETING.—Mr. Herbert Williams, as chairman of the Finance Committee, brought up a statement of the receipts at the recent annual meeting, and concluded by asking the sanction of the Council to the payment of prizes and other claims to the amount of £8059. The several proposals having been seconded were carried unanimously. It transpired in the course of the proceedings that although a loss of several hundred pounds was incurred by the Croydon Meeting, the Society will not have occasion to draw on its funded capital.

HARFORD MEETING.—With a view to the adequate encouragement of Channel Islands cattle at the Hereford Meeting, 1878, an addition of £100 was made to the amount granted for stock at the Bristol Meeting, thus raising it in the aggregate of £1800. The amount allowed to Stewards of poultry was increased to £225, with a view to offering the additional inducement of cups for Pigeons. To the department of horticulture £180 was allotted

## OIRENCESTER SHOW OF POULTRY, &c.

JULY 28TH, 29TH, 30TH.

MR. DARBY must be congratulated upon a most excellent Show, both as regards quality and numbers. We understand that a difficulty arose in procuring a Judge, when at the last minute Mr. John Martin was secured. The Committee will do well another year to arrange this matter earlier, and moreover advertise the Judge's name, that exhibitors may enter with confidence. In this instance the awards were not all satisfactory. The Show was held in a fine tent, Mr. Billett managing. The prize cards were a nice feature, being designs of Mr. Long's; the classes all illustrated on the face.

In *Light Brahmas* first were fair chicks, good in leg-feather, but by no means so large or so massive in shape as we have seen Mr. Haines show this season. The pen was also awarded the cup for the section over Dark Brahmas, Cochins, Dorkings, and Game. In our humble opinion either the first or second Buffs, the first Whites, or the first Dorkings were infinitely superior, and the most minute scrutiny failed to show us the justice of the award. Second were good old birds, but given to the exhibitor's worst of three pens; Mr. Bloodworth's No. 10 being very nice, the hen a beauty. Darks were a poor lot. First a big cock and fair hen; second a nice hen and a tallish big-combed cock of good colour. The best cock was 19 (Long), but the hen very poor. Buff *Cochins* were a grand class. First very rich colour; hen very good. Second rich, but a trifle square in tail. The first Whites were excellent in colour, shape, and feather; second rich Partridge. Black cocks were poor, but the hens fair. The first *Dorkings* were very fine, especially the hen; second a large cock, but poor hen. *Game* were not good. First a rich-coloured Black Red, not stylish enough; second a fair Brown Red. The first *Duckwing* was very high in tail, bad in colour, and badly dubbed; either of the Piles were decidedly preferable, being capital in colour and style, though their tails were broken; but the second was withheld from better birds than the winner. *Spanish* were poor. First a nice hen and fairly good cock. In *Gold-spangles* first was a neat cock and poor hen; second a moderate cock, with a hen of no merit whatever. The best pair were unnoticed, the cock being bare on his head. In *Silver-spangles* the first cock was a nice bird but very yellow, faulty in comb, and a little white in face; second a capital hen. 60 (Carr) were promising chicks. 63 (Long) was the best cock, but not so good a hen. In *Gold-pencils* the first cock had a good head, but no other qualities; the hen was better. Second a far better cock. Mr. Carr's was also a better cock, but not so neat in head. *Silver-pencils* were poor. In *French* first was a nice Crève cock with a poor hen. They took the section cup away from *Spanish* and *Hamburghs*. Second were Crèves, the cock small in crest. Mr. Lane's *Houdans* as a pair were the best of the lot, good in comb, colour, size, and head, but unnoticed. *Game Bantams* were poor. First Black Reds, fair; second neat Piles. The first *Silver-laced* were very fair; second moderate Blacks; a pen of capital White chicks being unnoticed. In the Variety class first were Black *Hamburghs*, second the same, third White *Minorcas*, fourth *Silver Polands*; the hen a fair one, but none of the *Polands* were of the quality we see further north. The *Duck* classes were very small, and the quality nothing extra. *Geese* numbered no less than twelve pens, but Mr. Derry's two pens did not put in an appearance, or he must have won. The first was a Grey and second White; the latter the better bird. *Bobbies* numbered fifty-seven in four classes—a good entry. *Lops* were not good, a Black winning first. In *Himalayas* first

was very good in nose, feet, and ears; second pressing close. In *Silver-Greys* first was grand all over; second dark in face. Messrs. Hacketts should have taken second honours with their very nice Rabbit. In the Variety class first and second were very well-woolled Angoras, and highly commended (Hackett) a nice Belgian hare.

In *Pigeons* the first Carrier was a good Dun; second good in eye-wattle. *Dragoons* were very numerous, 160 (Yardley) being our fancy; the first being, however, a nice bird, as was the second, although a little slight in beak. 166 (Woods) was a capital bird, unnoticed. In *Fantails* first and second were nice Blues, as was 172 (Yardley). Antwerps were easily won by Mr. Yardley with a Dun and a Red Chequer, nothing else approaching them. *Magpies* were very numerous and good. We thought the winner's highly commended pen No. 205 the best. In *Owls* first and second went to a nice White African and an English Silver, Mr. Vander Meer's Whites being coarse. In *Tumblers* first was a good Almond, second moderate ditto, a grand Kite being highly commended. In the Variety class first was a good Barb, second a very fine Runt. This was a very large but decidedly weak class.

There were a few rich Cayenne Norwich *Canaries*, and two or three good Mules. With these exceptions cage birds were decidedly a poor lot.

**BRAHMAS.**—Light.—1 and Cup, T. A. Dean. 2, J. Bloodworth. Dark.—1, Rev. G. W. Joyce.

**COCHINS.**—Ornamental or Buff.—1, C. Bloodworth. 2, J. Bloodworth. Any other variety.—1, C. Bloodworth. 2, B. Radcliffe.

## FOREIGN BIRDS.

**PARROT OR COCKATOO.**—1, Miss Bridges. 2, G. Parrott.

**LOVE BIRDS OR PARAKEETS.**—1, J. Bloodworth.

**ANY OTHER VARIETY OF FOREIGN BIRDS.**—1 and 2, E. Barnard.

## BISHOP AUCKLAND SHOW OF POULTRY, &c.

THIS meeting was on the 27th ult. in the cricket field. Although the prizes in poultry had been greatly enhanced in value, yet the number of entries were little more than half of those of last year, while the Pigeons and Rabbits showing an increase of fifty or thereabouts. *Game* were poor with the exception of a few birds, but the *Spanish* were very good. *Cochins* were a splendid lot, all the awards going to one yard, and also the extra prize. *Brahmas* good and well placed. *Hamburghs* were moderate classes, while the winners in some of the classes were as good as can be, the first in Gold and also in Silver-spangles particularly. In *French* were four pens, and *Polands* one of White-crested Blacks. Chickens brought eleven pens; the first good but not forward Buff *Cochins*; second *Dorkings*, and extra second a good pen of *Light Brahmas*. The Selling class was a mistake, no price being specified at which the exhibits could be claimed. *Turkeys* were very large and good, and the first-prize White *Geese* a grand pair. *Aylesburys* in *Ducks* were allowed a class to themselves, while all the rest were huddled in one class. Surely the list needs remodelling. Medals or the amount in cash of £2 and £1 were offered for birds in the county of Durham, but as separate entries had to be made in each class only five entries put in for the £5 thus offered.

*Pigeons* as seen before were a much better show. Carriers seventeen pens, with some good birds, and the winners Black. Pouters, the winners Blue. In *Tumblers* first and third were *Almonds*, and second a nice Black *Mottle* if clean, but now in

wretched condition. The first Almond had a most natural head: it was, if you please, but nobody knew unless he has something

### SHEWESBURY SHOW OF POULTRY, &c.

THIS Show was held on July 29th and 30th in connection with the Agricultural Society's Meeting. We expected to find many more entries, for the prize list was liberal and the entry fee low. The Committee, moreover, was composed of men all highly thoughtful of the fancy, and this has great influence with exhibitors. The weather has been very trying—wet days, cold winds, and scorching suns have followed, which do not keep the old birds in the best condition; we think the small number of entries, considering the liberality of the schedule, is to be attributed to some such cause.

Of *Dorkings* there were thirteen pens of Coloured; the first pen well deserved their position; the second contained a good hen, but cock only moderate; the third we could not agree with. We should have chosen three or four pens before that for the third place. In the next class Mr. Walker won the cup; his birds were Silver-Grays, and looked well. Second went to Whites, catalogued as five months old; third again going to fine Silver-Grays of much quality. *Cochins* were good classes. The first Buffs very fine, and the colour capital for the time of year; second and third also very good birds. 27 (Darby), empty; 36 (Tindal), a fair pen. In Partridges Mr. Tudman took all the three prizes and Mr. Brooke's cup, and probably deserved these honours. In the next class the first were Whites, containing the cock which has appeared so often of late. The second were good Blacks—i.e., good for Blacks; and third went to wretched Whites. We could see nothing in them. 44 (Woodgate) were in splendid condition, but look rather yellow. 46 (Tindal) a good pair; cock also yellow, but hen fine. *Brahmas* were two good classes, and were especially conspicuous for good chickens. The Rev. J. D. Peake's was a beautiful pen. We wonder if either this gentleman or his brother will produce pullets equal to what they did last season. The old birds in this class were mostly out of feather. In Light *Brahmas* all three prizes went to chickens of the year, but we did not quite like the awards here. The cup pen we believe came from Mr. Dean's yards very lately. *Games* were good classes, and we thought the cards were placed on the proper pens. The birds were principally adults, and many of them we have commented on before. *Spaniards* were moderate. They were not at their best, but we think we liked the third-prize pen as well as any. Mr. Beldon's second-prize pen were, however, fine in face. 186 (Alsopp) contained a good hen. *Hamburgs* were good classes. The Spangled only had one class, neither did the Pencilled. We do not doubt but that this prevented many from entering. The Spangled made the largest class, and were, perhaps, the best on the whole. Mr. Judson scored another triumph with his Golden-pencilled hen. She must be a perfect mine of wealth to him. There were only six pens of Black *Hamburgs*, but these were good. We suppose even Shropshire is too far for the Yorkshire and Lancashire people at this time of year—even when the Society offers them £10 10s. in prize money, and Mr. Darby offers a £8 8s. cup in addition for the best pen—to send and have a shot. *Frenchs*, too, were not large classes. The names of the winners show the quality of the exhibits. Mr. Lake showed a good pen of early Houdan chickens. We fear the Crève comb is daily becoming more common in the Houdan, and consequently believe the two breeds must be continually crossed even now. Certainly it is remarkable that nearly every French breeder keeps both varieties, and so the cross can be easily managed. *Malays* came thirteen pens strong, and a nice lot they were. A pen of six-months-old chickens won Mr. Tudman's cup, and deserved it; they soon changed hands for £7 7s. Miss Brooke's, too, were a good pair, and cheap at catalogue price. The old birds were beginning to look seedy in feather. The Variety class was very fine. The winning Silver *Polands* were a most magnificent pen, and are, we should almost think, the finest pair in existence. Second went to very beautiful White-crested Blacks; they were in good feather and splendidly shown. Mr. John Martin must have worked well at their crests, and they did him justice. Third good *Leghorns*. Highly commended, 198 (Judson), good *Silkie*. 201 (Darby) charming baby *Silkie*. Game *Bantams* only had one class. Mr. Hall's Reds were a smart pen; second going to capital Duckwing chickens; third fair Black Reds. In Variety *Bantam* class beautiful *Laced* were first and second, 219 (Greenswell), good Blacks, being very small, and we believe the Croydon winners. We cannot too emphatically speak against the folly of classing all *Bantams* but Game together; it is most unfair to Judge and exhibitor. 220 (Maye) and 218 (Beldon) good Blacks. *Turkeys*, *Geese*, and *Ducks* were all good classes. Mr. Walker sent a grand lot.

*Figeons* were only small in number, but the quality was good. The first Tumblers were good *Almonds*, and second *Agates*. In *Carriers* first and second were excellent Blacks and Duns. In *Fantails* the whole were of unusual excellence, as the names

will suggest. Nuns were also good; first Black, second Red. In *Bards* first and second were splendid; very highly commended (Yardley), capital *Yellows*. The first and second *Antwerps* were beautiful Short-faced birds. *Dragoons* were good, both capital Blues. *Pouters* were decidedly poor; first Blue, second White. *Owls* were fair, the winners both White. In the Variety class first were very good *Archangels*, second very fine *Bunts*, fair *Turbits* being highly commended.

*DORKINGS*.—Dark.—1, J. Walker, Rochdale. 2, T. Parlett, Galleyswood, Chesham. 3, Mrs. Bards, Gwynedd Barrow. 4, Rev. E. Bartrum, Berks. 5, W. H. Crabtree, Levensham. 6, H. Shaw, Oswestry. 7, A. Darby, Shrewsbury. 8, Any other variety.—1 and Cup, J. Walker. 2, T. C. Burnell, Micklethorpe. 3, O. E. Crosswell, Basshot. 4, Countess Dartmouth, Wolverhampton. 5, C. Countess Dartmouth. 6, O. E. Crosswell.

*COCHINS*.—Cinnamon and Buff.—1 and 2, H. Tomlinson. 3, Mrs. E. Alsopp, Worcester. 4, T. Groves, Shrewsbury. 5, B. Gwynn, Wem. 6, Mrs. A. Tindal, Aylesbury. 7, Brocks and Partridge.—1, Cup, 2, and 3, T. E. Burdman, M. W. H. Crabtree. 4, Brocks. 5, Any other variety.—1, W. Whitworth, Manchester. 2, W. Badger, Little Ness. 3, H. Tomlinson. 4, Mrs. A. Tindal. 5, G. Forty, Shrewsbury. 6, W. Whitworth. 7, R. S. S. Woodgate, Farnbury. 8, G. Forty. 9, T. S. Tones, Bridgenorth.

*BRAHMAS*.—Dark.—1 and Cup, Rev. J. D. Peake, Laleham Vicarage, Chertsey. 2, T. F. Andell, St. Helena. 3, W. H. Crabtree. 4, E. Kendrick, Jun., Lichfield. 5, E. Pritchard, Wolverhampton. 6, Horace Lingwood, Needham Market. 7, Pease, Swans. 8, R. E. Wood, Ulkester. 9, Light.—1 and Cup, H. East. 2, 3, and 4, T. A. Dean, Marden. 5, Mrs. H. Poulkes, Montgomery. 6, Haines, Palgrave, Diss. 7, T. A. Dean. 8, Mrs. A. Tindal.

*GAMES*.—Black-breasted Red.—1, J. Mason, St. John's, Worcester. 2, E. Winwood, The Grove, Worcester. 3, H. Horton, Malvern. 4, P. A. Beck, Welshpool. 5, Brown-breasted Red.—Cup and 1, H. E. Martin, Fakenham. 2, G. F. Ward, Wrenbury. 3, W. Farrin, Nantwich. 4, J. E. Prinos, Nantwich. 5, R. Ashley, Nantwich. 6, D. H. Owen, Oswestry. 7, T. Burdman, Whitby. 8, J. Masey, or any other variety.—1, F. Ward. 2, W. C. Phillips, Worcester. 3, J. Masey. 4, E. Bell, Burton-on-Trent. 5, D. W. J. Thomas, Brecon. 6, R. Ashley, E. Holland, Overden.

*SPANISH*.—1 and Cup, S. L. Edwards, Tarporley. 2, H. Beldon, Golestock, Bingley. 3, A. Darby. 4, Mrs. E. Alsopp. 5, D. M. Mills, Newport Pagnell.

*HAMBURGERS*.—Gold or Silver-spangled.—1, T. Blakeman, Wolverhampton. 2, J. Robinson, Garstang. 3, H. Beldon. 4, T. Dean, Keighley. 5, Carr, Swans. 6, J. Long, Bromley Common. 7, H. Beldon. 8, H. Beldon. 9, H. Beldon. 10, J. Long, or any other variety.—1, F. Peckham. 2, H. Poulkes. 3, and 4, H. Beldon. 5, Cup, and 6, H. Beldon. 7, J. Long. 8, J. M. Kivert, Wem. 9, C. Evans, or any other variety.—1, F. Lake, Sittingbourne. 2, W. Dring, Faversham. 3, W. H. Crabtree.

*HOUDANS*.—1, W. Whitworth. 2, F. Lake. 3, R. B. Wood. 4, S. W. Thomas, Swans. 5, J. K. Fowler, Aylesbury. 6, E. B. Wood.

*MALAYS*.—1, Cup and 2, Rev. H. Fairlie, Maybole. 3, Miss A. Brooke, Shrewsbury. 4, E. Hawkins, Seacombe. 5, H. Beldon. 6, A. Darby (Poland). 7, R. E. Fowler, Aylesbury (White Leghorn). 8, W. B. Etches, Whitby. 9, Scotch Grey. 10, J. Judson (Japanese Silkie). 11, A. Darby (Silkie). 12, J. J. Scott, Llanstydham (Golden Poland). 13, H. Beldon.

*BANTAMS*.—Game.—1, G. Hall, Kendal. 2, A. Darby. 3, G. F. Ward. 4, R. J. Hartley, Altrincham. 5, Any other variety.—1 and Cup, M. Leno, Dunstable. 2, Rev. J. Hill, Shrewsbury. 3, J. W. Lloyd, Elington. 4, W. Richardson, York. 5, H. Beldon. 6, O. E. Crosswell. 7, H. Beldon.

*TUMBLERS*.—1 and Extra. Rev. N. J. Ridley, Newbury. 2, E. Kendrick, Jun. 3, W. B. Etches. 4, J. Walker. 5, J. C. L. Rocks, Aston-on-Clan. 6, Grass.—1 and Extra. R. E. Fowler. 2, J. Walker. 3 and 4, T. Mills, Seacombe, Birkenhead.

*DUCKS*.—Aylesbury.—1, J. K. Fowler. 2, S. E. Harris. 3, J. Walker. 4, J. Walker. 5, G. Gulliver, Aylesbury. 6, J. K. Fowler. 7, J. K. Fowler. 8, J. K. Fowler. 9, J. K. Fowler. 10, J. K. Fowler. 11, J. K. Fowler. 12, J. K. Fowler. 13, J. K. Fowler. 14, J. K. Fowler. 15, J. K. Fowler. 16, J. K. Fowler. 17, J. K. Fowler. 18, J. K. Fowler. 19, J. K. Fowler. 20, J. K. Fowler. 21, J. K. Fowler. 22, J. K. Fowler. 23, J. K. Fowler. 24, J. K. Fowler. 25, J. K. Fowler. 26, J. K. Fowler. 27, J. K. Fowler. 28, J. K. Fowler. 29, J. K. Fowler. 30, J. K. Fowler. 31, J. K. Fowler. 32, J. K. Fowler. 33, J. K. Fowler. 34, J. K. Fowler. 35, J. K. Fowler. 36, J. K. Fowler. 37, J. K. Fowler. 38, J. K. Fowler. 39, J. K. Fowler. 40, J. K. Fowler. 41, J. K. Fowler. 42, J. K. Fowler. 43, J. K. Fowler. 44, J. K. Fowler. 45, J. K. Fowler. 46, J. K. Fowler. 47, J. K. Fowler. 48, J. K. Fowler. 49, J. K. Fowler. 50, J. K. Fowler. 51, J. K. Fowler. 52, J. K. Fowler. 53, J. K. Fowler. 54, J. K. Fowler. 55, J. K. Fowler. 56, J. K. Fowler. 57, J. K. Fowler. 58, J. K. Fowler. 59, J. K. Fowler. 60, J. K. Fowler. 61, J. K. Fowler. 62, J. K. Fowler. 63, J. K. Fowler. 64, J. K. Fowler. 65, J. K. Fowler. 66, J. K. Fowler. 67, J. K. Fowler. 68, J. K. Fowler. 69, J. K. Fowler. 70, J. K. Fowler. 71, J. K. Fowler. 72, J. K. Fowler. 73, J. K. Fowler. 74, J. K. Fowler. 75, J. K. Fowler. 76, J. K. Fowler. 77, J. K. Fowler. 78, J. K. Fowler. 79, J. K. Fowler. 80, J. K. Fowler. 81, J. K. Fowler. 82, J. K. Fowler. 83, J. K. Fowler. 84, J. K. Fowler. 85, J. K. Fowler. 86, J. K. Fowler. 87, J. K. Fowler. 88, J. K. Fowler. 89, J. K. Fowler. 90, J. K. Fowler. 91, J. K. Fowler. 92, J. K. Fowler. 93, J. K. Fowler. 94, J. K. Fowler. 95, J. K. Fowler. 96, J. K. Fowler. 97, J. K. Fowler. 98, J. K. Fowler. 99, J. K. Fowler. 100, J. K. Fowler. 101, J. K. Fowler. 102, J. K. Fowler. 103, J. K. Fowler. 104, J. K. Fowler. 105, J. K. Fowler. 106, J. K. Fowler. 107, J. K. Fowler. 108, J. K. Fowler. 109, J. K. Fowler. 110, J. K. Fowler. 111, J. K. Fowler. 112, J. K. Fowler. 113, J. K. Fowler. 114, J. K. Fowler. 115, J. K. Fowler. 116, J. K. Fowler. 117, J. K. Fowler. 118, J. K. Fowler. 119, J. K. Fowler. 120, J. K. Fowler. 121, J. K. Fowler. 122, J. K. Fowler. 123, J. K. Fowler. 124, J. K. Fowler. 125, J. K. Fowler. 126, J. K. Fowler. 127, J. K. Fowler. 128, J. K. Fowler. 129, J. K. Fowler. 130, J. K. Fowler. 131, J. K. Fowler. 132, J. K. Fowler. 133, J. K. Fowler. 134, J. K. Fowler. 135, J. K. Fowler. 136, J. K. Fowler. 137, J. K. Fowler. 138, J. K. Fowler. 139, J. K. Fowler. 140, J. K. Fowler. 141, J. K. Fowler. 142, J. K. Fowler. 143, J. K. Fowler. 144, J. K. Fowler. 145, J. K. Fowler. 146, J. K. Fowler. 147, J. K. Fowler. 148, J. K. Fowler. 149, J. K. Fowler. 150, J. K. Fowler. 151, J. K. Fowler. 152, J. K. Fowler. 153, J. K. Fowler. 154, J. K. Fowler. 155, J. K. Fowler. 156, J. K. Fowler. 157, J. K. Fowler. 158, J. K. Fowler. 159, J. K. Fowler. 160, J. K. Fowler. 161, J. K. Fowler. 162, J. K. Fowler. 163, J. K. Fowler. 164, J. K. Fowler. 165, J. K. Fowler. 166, J. K. Fowler. 167, J. K. Fowler. 168, J. K. Fowler. 169, J. K. Fowler. 170, J. K. Fowler. 171, J. K. Fowler. 172, J. K. Fowler. 173, J. K. Fowler. 174, J. K. Fowler. 175, J. K. Fowler. 176, J. K. Fowler. 177, J. K. Fowler. 178, J. K. Fowler. 179, J. K. Fowler. 180, J. K. Fowler. 181, J. K. Fowler. 182, J. K. Fowler. 183, J. K. Fowler. 184, J. K. Fowler. 185, J. K. Fowler. 186, J. K. Fowler. 187, J. K. Fowler. 188, J. K. Fowler. 189, J. K. Fowler. 190, J. K. Fowler. 191, J. K. Fowler. 192, J. K. Fowler. 193, J. K. Fowler. 194, J. K. Fowler. 195, J. K. Fowler. 196, J. K. Fowler. 197, J. K. Fowler. 198, J. K. Fowler. 199, J. K. Fowler. 200, J. K. Fowler. 201, J. K. Fowler. 202, J. K. Fowler. 203, J. K. Fowler. 204, J. K. Fowler. 205, J. K. Fowler. 206, J. K. Fowler. 207, J. K. Fowler. 208, J. K. Fowler. 209, J. K. Fowler. 210, J. K. Fowler. 211, J. K. Fowler. 212, J. K. Fowler. 213, J. K. Fowler. 214, J. K. Fowler. 215, J. K. Fowler. 216, J. K. Fowler. 217, J. K. Fowler. 218, J. K. Fowler. 219, J. K. Fowler. 220, J. K. Fowler. 221, J. K. Fowler. 222, J. K. Fowler. 223, J. K. Fowler. 224, J. K. Fowler. 225, J. K. Fowler. 226, J. K. Fowler. 227, J. K. Fowler. 228, J. K. Fowler. 229, J. K. Fowler. 230, J. K. Fowler. 231, J. K. Fowler. 232, J. K. Fowler. 233, J. K. Fowler. 234, J. K. Fowler. 235, J. K. Fowler. 236, J. K. Fowler. 237, J. K. Fowler. 238, J. K. Fowler. 239, J. K. Fowler. 240, J. K. Fowler. 241, J. K. Fowler. 242, J. K. Fowler. 243, J. K. Fowler. 244, J. K. Fowler. 245, J. K. Fowler. 246, J. K. Fowler. 247, J. K. Fowler. 248, J. K. Fowler. 249, J. K. Fowler. 250, J. K. Fowler. 251, J. K. Fowler. 252, J. K. Fowler. 253, J. K. Fowler. 254, J. K. Fowler. 255, J. K. Fowler. 256, J. K. Fowler. 257, J. K. Fowler. 258, J. K. Fowler. 259, J. K. Fowler. 260, J. K. Fowler. 261, J. K. Fowler. 262, J. K. Fowler. 263, J. K. Fowler. 264, J. K. Fowler. 265, J. K. Fowler. 266, J. K. Fowler. 267, J. K. Fowler. 268, J. K. Fowler. 269, J. K. Fowler. 270, J. K. Fowler. 271, J. K. Fowler. 272, J. K. Fowler. 273, J. K. Fowler. 274, J. K. Fowler. 275, J. K. Fowler. 276, J. K. Fowler. 277, J. K. Fowler. 278, J. K. Fowler. 279, J. K. Fowler. 280, J. K. Fowler. 281, J. K. Fowler. 282, J. K. Fowler. 283, J. K. Fowler. 284, J. K. Fowler. 285, J. K. Fowler. 286, J. K. Fowler. 287, J. K. Fowler. 288, J. K. Fowler. 289, J. K. Fowler. 290, J. K. Fowler. 291, J. K. Fowler. 292, J. K. Fowler. 293, J. K. Fowler. 294, J. K. Fowler. 295, J. K. Fowler. 296, J. K. Fowler. 297, J. K. Fowler. 298, J. K. Fowler. 299, J. K. Fowler. 300, J. K. Fowler. 301, J. K. Fowler. 302, J. K. Fowler. 303, J. K. Fowler. 304, J. K. Fowler. 305, J. K. Fowler. 306, J. K. Fowler. 307, J. K. Fowler. 308, J. K. Fowler. 309, J. K. Fowler. 310, J. K. Fowler. 311, J. K. Fowler. 312, J. K. Fowler. 313, J. K. Fowler. 314, J. K. Fowler. 315, J. K. Fowler. 316, J. K. Fowler. 317, J. K. Fowler. 318, J. K. Fowler. 319, J. K. Fowler. 320, J. K. Fowler. 321, J. K. Fowler. 322, J. K. Fowler. 323, J. K. Fowler. 324, J. K. Fowler. 325, J. K. Fowler. 326, J. K. Fowler. 327, J. K. Fowler. 328, J. K. Fowler. 329, J. K. Fowler. 330, J. K. Fowler. 331, J. K. Fowler. 332, J. K. Fowler. 333, J. K. Fowler. 334, J. K. Fowler. 335, J. K. Fowler. 336, J. K. Fowler. 337, J. K. Fowler. 338, J. K. Fowler. 749, J. K. Fowler. 750, J. K. Fowler. 751, J. K. Fowler. 752, J. K. Fowler. 753, J. K. Fowler. 754, J. K. Fowler. 755, J. K. Fowler. 756, J. K. Fowler. 757, J. K. Fowler. 758, J. K. Fowler. 759, J. K. Fowler. 760, J. K. Fowler. 761, J. K. Fowler. 762, J. K. Fowler. 763, J. K. Fowler. 764, J. K. Fowler. 765, J. K. Fowler. 766, J. K. Fowler. 767, J. K. Fowler. 768, J. K. Fowler. 769, J. K. Fowler. 770, J. K. Fowler. 771, J. K. Fowler. 772, J. K. Fowler. 773, J. K. Fowler. 774, J. K. Fowler. 775, J. K

ful exhibitor as J. K. Fowler is placed second. *Game fowls* were numerous, but not superior. After mentioning the winners *Game Bantams* were poor; but the any variety Bantams contained several good pens, especially the first and second prize-takers. The following is a list of the awards:—

**DORKINGS.—Coloured.**—1, J. K. Fowler, Aylesbury. 2, Mrs. B. Radclyffe, Hyde. 3, T. Gough, Buckingham. *Any other variety.*—1, E. Woodford, Kildington. 2, J. J. Terry, Buckingham.

**COCHINS.—Cinnamon or Buff.**—1, Mrs. B. Radclyffe. 2, W. W. Woodin. 3, J. K. Fowler. *Any other variety.*—1, J. K. Fowler. 2, A. F. Faulkner, Thrapston. 3, T. M. Derry, Gedney, Wisbeach. *Ac.* J. K. Fowler; 1, Rodwell, Maldenmoreton. *Any variety.—Cock.*—1, T. Atterton. 2, J. K. Fowler.

**BRAHMAS.—Light.**—1, F. Haines, Palegrave, Diss. 2, T. Bear, Aylesbury. 3, J. Terry. *Dark.*—1, J. K. Fowler. 2, H. Feast. 3, H. Wyman, Conington. *Ac.* M. Leno, Dunstable. 4, F. White, Leighton Buzzard. *Any variety.—Cock.*—1, J. K. Fowler.

**GAME.—Black and Brown-breasted Red.**—1, E. Winwood, Worcester. 2, S. Field, Ambroden, Leicester. 3, A. C. Swain, Redditch, Buckingham. 4, J. J. Jeken, Eitham. *Any other variety.*—1, E. Winwood. 2, H. Feast. 3, W. S. Ridge, Thornborough. *Any variety.—Cock.*—1, S. Field. *Ac.* A. C. Swain; G. Fitz-Herbert. 4, J. Jeken.

**SPANISH.**—1, D. M. Mills, Newport Pagnell. 2, E. Winwood. 3, C. Davies. **HAMBURG.**—*Gold and Silver-spangled.*—1, H. R. Platten, Fakenham. 2, H. Pickles, Earsy, Leoda. *Gold and Silver-pencilled.*—1, A. F. Faulkner. 2, H. Feast. 3, H. Pickles. *Any variety.—Cock.*—1, H. Pickles. *Ac.* A. F. Faulkner.

**BANTAMS.—Game, Black and Brown Red.**—1, W. Adams, Ipswich. 2, V. Hamford, Broughton, Upper Norwood. 3, H. Feast. *Any other variety.*—1, M. Leno. 2, W. Mayo, Shalstone. 3, E. M. Southwood, Fakenham. *Ac.* W. T. Hobbs, Buckingham. 4, T. Bradbury, Buckingham. *Any variety.—Cock.*—1, T. Bradbury. 2, M. Leno.

**FAMULAR FOWLS.**—1, J. Bennett, Buckingham. 2, J. Rodwell.

**ANY VARIETY.—Chickens.**—1, J. K. Fowler. 2, W. Wheeler, Buckingham.

**DUCKS.—Aylesbury.**—1 and 2, T. Bear. 3 and 4, J. K. Fowler. 5, J. Bennett. *Brown.*—1, G. Cox, Maldenmoreton. 2, J. K. Fowler. 3, E. Woodford. *Ac.* Rev. M. Withington, Fringford, Leicester.

**GEES.—White.**—1, J. K. Fowler. 2, T. M. Derry. 3, Mrs. B. Radclyffe. *Any other variety.*—1, H. Wyman. 2, Mrs. Osborn, Maldenmoreton.

**TURKEYS.**—1, W. Hawkins, Borton. 2, Rev. E. Withington. 3, J. Bennett.

#### COTTAGERS' CLASSES.

**FOWLS.**—1, B. Coleman, Buckingham. 2, E. Soton, Buckingham. 3, W. Hickman, Gawcott. 4, T. Hands, Buckingham. 5, E. Soton. 6, T. Thomas, Maldenmoreton; J. Gunthorpe, Buckingham.

**DUCKS.**—1, E. Soton. 2, P. Soton. 3, T. Hands. 4 and 5, J. Gunthorpe.

### CLEVELAND SHOW OF POULTRY, &c.

THE forty-second annual Show of the Cleveland Society was held at Guisborough on July 29th in the park and grounds kindly lent for the purpose by Rear-Admiral Challoner. The arrangements for poultry were very good, in fact this is one of the best-managed societies in the kingdom.

Spanish headed the list, and were a fair lot; the *Dorkings* being very good in all particulars. The winners in *Cochins* were good in both classes, in one Buffs, and in the other Whites. The entry in *Brahmas* was good, but with the exception of one pen they were a bad lot. *Game* were a moderate lot; the winners in Reds were of the Brown-breasted variety. Ducks-wings won in the following class, these being good, especially the hens. In single cocks the winners were Black Reds, the first an old excellent-coloured bird; the second better in style, but not equal in colour and rather crooked in breast. Only the first pen and second-prize cock were of any quality in Game; but the following class was very good, first Black, second Silver-laced, and extra second a pair of Nankin Bantams, very good and rare. *Hamburgs* good, old birds winning all the prizes; and in Gold-pencils all were noticed. Silver-pencils a fair lot; Gold-spangled *Hamburgs* good as regards the winners. Silver-spangled good as regards the winners only. The Variety class was very good, first being Houdans, second Malays, extra second Black *Hamburgs*, and third Sultans. *Aylesbury Ducks* were very good in both size and quality of bill; the Rouens good as regards the winners only. In the variety of Ducks the first were Pintail, second Teal, and highly commended Carolinas and Widgeon. *Geese* and *Turkeys* were better than of late years, the former approaching more closely to the specimens of eight or ten years ago, and which seem to have been brought out of the locality.

*Rabbits* had two classes; in the first Lop-eared winning the first, a Fawn-and-White, 22 by 4½; and second a Tortoiseshell, 20 by 4½. In the following class an even-coloured and fairly-silvered specimen of Silver-Grey was first; a Belgian Hare slightly yellow in shade second; and Himalayan highly commended in three cases.

**SPANISH.—Black.**—1, J. P. Carver, Langthorpe. 2, H. Dale, Old Ormesby. 3, E. C. T. Flintoff, Newby.

**DORKINGS.**—1, E. Barker, Stokeley. 2, A. Jackson, Broughton. 3, R. Seath, Conington, Yarm. 4, Lady D. F. Yeoman, Whitby.

**COCHINS.—Cinnamon or Buff or Cinnamon.**—1 and 2, G. H. Procter, Durham. 3, R. Sellers, Swinby. *Any other colour.*—1 and 2, G. H. Procter.

**BRAHMA FOWLS.**—1, J. P. Carver. 2, Miss Jacques, Earsy Abbey. 3, Rear-Admiral Challoner, Guisborough.

**GAME.—Reds.**—1, W. Youngshand, Darlington. 2, W. Bearpark, Ainderby Steeple. 3, G. Carter, Sandhill, Bedale. 4, E. J. Smith, Yarm. *Any other variety.*—1, W. Bearpark. 2, G. Holmes, Great Driffield. 3, T. Potts, Redcar. 4, W. Youngshand. 5, T. Potts. 6, W. Storey.

**BANTAMS.—Game.**—1, W. O. Dawson, Whitby. 2, G. Holmes. *Any other variety.*—1, J. P. Carver. 2, T. P. Carver, Langthorpe. Extra 2, Rev. J. G. Milner, Hamsterley Vicarage. 3, J. Peacock, Old Ormesby; Miss S. C. Fosse, Guisborough. 4, J. Peacock.

**PELTAS.**—1, W. Bearpark.

**HAMBURG.—Golden-pencilled.**—1, T. P. Carver. 2, E. Keenlyside, Aycliffe. 3, B. & G. Kison, Old Ormesby. 4, R. Seath; E. Barker, Stokeley; T. S. Turner, Stokeley. *Silver-pencilled.*—1, E. Keenlyside. 2, W. Bearpark. *Golden-spangled.*—1, E. Keenlyside. 2, T. P. Carver. 3, G. Holmes. 4, R.

Seath; E. Burn, Whitby. *Silver-spangled.*—1, E. Keenlyside. 2, G. Holmes. 3, R. Seath.

**ANY OTHER VARIETY.**—1, Rev. J. G. Milner. 2, Lady D. F. Yeoman. Extra 2, T. P. Carver. 3, Miss E. C. Brown, Middleborough. 4, Lady D. F. Yeoman; 5, Burn. 6, W. Byers, Guisborough.

**DUCKS.—Aylesbury.**—1, F. E. Gibson, Middleton-in-Teesdale. 2, T. P. Carver. 3, G. Holmes. *Brown.*—1, Rev. J. G. Milner. 2, T. P. Carver. *Any other variety.*—1, Rev. J. G. Milner. 2 and 3, T. P. Carver. 4, Rev. J. G. Milner; 5, Burn.

**GEES.**—1, G. Holmes. 2, J. Walton, Aekham, E. R. Dodsworth, Stainton. 3, Miss A. C. Temple, Applebridge, Great Yarm. *Geese.*—1, J. Walton. 2, G. Holmes. 3, Miss Dale, Guisborough; 4, R. Dodsworth.

**TURKEYS.**—1, Miss Kirk, Givendale, Ripon. 2, T. P. Carver. 3, R. Dodsworth. Young.—1, R. Dodsworth.

#### RABBITS.

**LOP-EARED.—Buck or Doe.**—1, J. T. Robinson, Darlington. 2, J. Taylor, Middleborough. 3, G. Knaggs, Borton; C. Stephenson, Middleborough; J. Lint, Farnor Burn.

**Buck or Doe.**—1, E. McKay, Darlington. 2, J. T. Robinson, Darlington. 3, T. Moore, Normansby; C. J. Foster, Middleborough.

JUDGE.—Mr. E. Hutton.

### CAPTAIN HILL'S BANTAMS AND PIGEONS IN THEIR HOME AT EALING.—No. 1.

It is not often that "poor letter H," that much-abused letter, made to be present when it ought not, dismissed also summarily when it ought not—it is not often, I say, that poor H is by accident rightly treated, but it is sometimes. Thus, when on the Great Western the train stops at Hanwell the porters invariably call out "Anwell," but they blunder upon the right name, for there was once a curative spring there known as St. Ann's Well, whence the name of the place. Then, when the same train stops at Ealing, the porters there call out "Healing," they blunder again rightly, for that village was known in olden times for its healing waters, whence its name. One part of the parish of Ealing is known as Castle Hill Park, and has its station of Castle Hill. To that station I betake myself in order to reach the residence of Captain Hill, who has of late gained high honours with his Pigeons, especially his Pouters, having taken first and cup in Blue cocks at the last "Pigeon Derby," the Crystal Palace Show, besides other successes. I knew also that Captain Hill had a very large number of valuable Pigeons, so that very readily I embraced the opportunity kindly afforded of seeing his birds at home.

I reach Castle Hill station one glorious summer morning. The district near is known as Castle Hill, in older times Castle-bear Hill. The chief house of the district, and one which has some historical interest, is Castle Hill Lodge, once the property of the Duke of Kent, father of Her present Majesty the Queen. A picture of it is now before me as it was in the Duke's time; not a first-class mansion, the building being low and not large, but the front pleasing with its central portico with four Ionic columns surrounded by a triangular pediment. This house has long since passed out of royal hands, and the whole neighbourhood became the property of a building speculator, to, I believe, his injury. He formed plans not yet at least realised. Some handsome blocks of houses were finished, some handsome separate houses were built, and the rest of the ground mapped out for building, but not built on. There are walls for gardens, but inside no gardens; gateways to approaches with no approaches, and no houses to be approached. It is easy to point a moral to the man who began to build and had not the wherewith to finish. No doubt it will all come right some day, for there is such a fine air at Castle Hill, and it is such thorough country, though so near London as six miles. Then I stumble over, direct in my way, the foundations of a new church, and people are sure to follow a church, and come at least outside its walls. My short walk is brought to a close, for a handsome villa is before me, with the word "Edina" on its gateposts. "Edina" is the poetic name for Edinburgh, as Burns sings—

"Edina! Scotia's darling seat!  
All hail thy palaces and towers,  
Where once beneath a monarch's feet  
Sat Legislation's sovereign power."

It is a graceful and patriotic thing that a native of Edinburgh should thus name his residence. After a kindly welcome—and I must again quote Burns's poem, for—

"Thy sons, Edina, social, kind,  
With open arms the stranger hail,"

I am after awhile taken to see the birds. These were not close at hand, but some half mile distant, giving one a charming walk down a sloping vale—a gentle slope, where haymaking was going on—that pleasant work, which somehow seems always half play—outdoor work in which children mingle, and girls once a-year join, and think it rare healthy fun, as it indeed it is. Somehow or other walking from Edina through the hay the words of the fine old Scotch ballad would keep coming into my mind and almost to my lips—

"'Twas within a mile of Edinburgh town,  
In the rosy time of the year,  
Sweet flow'rets bloom'd, and the grass was down,  
And each shepherd wou'd his deer."

The scene was somewhat classical, for before me, four miles off and very conspicuous, was the spire of the church of Harrow-on-

the-Hill, suggestive of great names in the world of politics and literature. Passing on the right Castle Hill Lodge before mentioned I near a large lot of buildings, forming two sides of a square—just a right angle—being, in fact, the mews belonging to the villas near; rather a Cockney arrangement for houses so far in the country, where one would suppose each owner would prefer his stable to be near at hand for that after-breakfast stroll into the stable so dear to an Englishman's heart while enjoying full often his matutinal cigar.

On approaching the mews I see on the sunny side troops of Bantams strutting about as only Bantams can strut. These were Captain Hill's, whose long residence in Japan naturally led him to have a taste for the Japanese Bantams. Before me is a black cock (imported) of that breed of a most brilliant lustre. Black, and no mistake, with such flowing sickles and saddle, and with scarcely any legs. I learnt that in Japan the wholly black birds are chiefly prized, and not such as are so frequently shown in England parti-coloured. It is a part of Capt. Hill's plan to keep anything unusual. Thus there is a black cock with golden hackles, bred from Japanese. These used to be seen frequently in England a few years since. Then the birds had thrown a Nankin-coloured hen. Do not these instances throw some light upon the origin of our old English Bantams, and that some of their varieties were imported, and that Bantams may not be such an erroneous name after all? Truly Capt. Hill's Japanese Bantams are very interesting, as being actually birds from Japan. I pass on to find Game Bantams, that last-made English variety of times.

Here, too, among some very correctly-feathered birds, such as good Brown Reds, Black Reds, and some admirable Duckwings, are preserved some odd productions—White Game bred from Brown Reds; very light Wheatears, almost cream-coloured all over, and one quite Cuckoo-feathered, showing that even in the best strains the colours of Game Bantams are not yet fixed, for these were birds from first-class strains. But I must not pause too long among these charming pets, but must proceed to the Pigeons.—WILTSIRE Rector.

#### SELECTION.—No. 2.

There is a species of pluck in some men which prevents them from retracting any statement they have made until an irresistible amount of evidence is brought to bear against them. This is not, I would say, so much from want of manliness as from their firmly believing that they are right, and that no one outside the scientific circle understands anything of their subject. Such has been the case with some of our early as well as late writers on ornithology.

The early writers on this question informed the world that the Stock Dove was the parent of all the varieties of our fancy Pigeons, but by-and-by it was discovered that the Stock Dove was not a Pigeon at all, that it was a true Dove, one of the family of Graspers—that is, a bird which can sit safely and comfortably on the rooking branch of a tree, whereas the Pigeon family are all what I may call flat-footed; they cannot rest on a small round perch, but must have ledges or shelves as their resting places. However, the theory of one original parent being started, it seems it must be kept up, and the small Blue Rock Pigeon of our seacoasts was next pronounced to be the parent of those beautiful and elegant birds we now possess called "fancy Pigeons."

Later writers on ornithology have all, so far as I recollect, supported this theory, and copyists down to the smallest fry of the present day in our country have struck upon the same chord without giving us the history of their experiments or inquiries; and I do often feel annoyed at some of our small copyists persistently drumming this theory into our ears when I have the knowledge that they know nothing whatever about it. They put me in mind of a London policeman whom I asked to direct me to a street I knew to be in his neighbourhood, and who, after a few moments' thought, replied—"I have not a second idea sir." But let us take a calm view of this theory, and what can we or anyone make of it? We are told our fancy varieties of Pigeons can be destroyed by crossing; but what of their production? We have not the most feeble proof nor the ghost of evidence that they are produced from one common parent; and to sum up the whole life of this theory it amounts to, So-and-so thought so, and so do I—a frail and doubtful reed to lean upon, a mere vision of the night which must be dispelled by the light of day, and we as practical fanciers must not sleep to dream,

"For the soul is dead that slumbers,  
And things are not what they seem."

Still our theorists go a step further, and as if to finally clench their theory, they insist that the common doveote Pigeon is a "sport" or descendant of the Blue Rock Pigeon. This I deny, and hope to prove it very shortly in these columns under the title of "The Blue Rock Pigeon." Ornithological writers I think have misnamed this latter bird, and with all my reverence for men of letters in natural history I will venture to give it a new scientific name, the one I think it deserves. But allow me

to presume for the sake of following up this theory that the doveote Pigeon has sprung from the Blue Rock Pigeon. What then? Will anyone come forward and tell us they have bred any one variety from the common Pigeon? or that they ever saw the slightest move towards any one of our varieties now known?

I have visited old doveotes which have stood since before the days of Oliver Cromwell, and where I have reason to believe the descendants of the Pigeons then are there now, but I could see in flocks of hundreds no varieties but in colour, and the oldest inhabitants had never known other than are now seen. But to pursue this theory a step further, is it not common sense to expect that naturalists as well as intelligent Pigeon fanciers should find some, if not all, of our fancy Pigeons in a state of transition from the common Pigeon to the fancy Pigeon now? If not, when did the various developments cease? Further still, we are told that all our fancy Pigeons have descended from the Blue Rock Pigeon; if so, why is it that there are only a select few varieties? If the Blue Rock Pigeon is the parent of all known varieties, we may safely expect a new variety now and then; in fact, varieties *ad infinitum*.

In connection with this take a glance at the history of some of the florists' flowers; with each new spring there come new roses, fuchsias, &c.; each flower springs from one common parent, and many of them so distinct from each other, particularly in fuchsias, that the unlearned in flowers do not distinguish them to be of one family. How is it, then, that we cannot attain to this infinite variety in Pigeons? For two hundred years we have not had one new variety, and for aught I know not one new variety for thousands of years, and with all our knowledge of science, our opportunities and means, we cannot introduce one new variety now. I will admit that as the unknown parts of the world come to be explored we may find some variety now unknown; but when found it will be like those now in our possession—perfect, not in a state of transition.

Having from early life taken an interest in this subject, I have not only consulted books, but Pigeon fanciers of all ages, many of them old men who have long since passed away, and their experience one and all was that no variation had ever been observed in the produce of the common Pigeon except in colour. I have also consulted some of the "doctors" who support this theory, but to my questions I received only evasive answers. Notably among these was the late Sir W. Jardine, with whom I had much intercourse on natural history subjects. He was a firm believer in this theory, but my questions did not suit the constitution of the doctor. When he was pressed for a single example of variation from the Blue Rock, or one specimen in transition, I was put off with, "When you have studied the subject as I have done you will agree with me." I have done so for twenty-eight years since then, and I am still of the opinion that neither the Blue Rock nor doveote Pigeon have any connection with the varieties now known.

Now let us take a glance at the mere cobweb upon which naturalists hang this theory. It is all upon the bars on the wings and tail, and certain spots on the plumage, particularly the light-marked line on the outer webs of the outside feathers of the tail of the Rock Pigeon, and which we certainly trace on all the blue specimens of our varieties. This we need tell no Pigeon fancier does exist in our blue-coloured fancy Pigeons of whatever variety. This is the first, last, and only reason which naturalists give for the theory they have adopted and promulgated. I could forward several species of birds in which certain markings run through the whole, but will only trouble you with one. The Doves and the nearest allied to Pigeons have, as a rule, one common mark; the Cushat or Ring Dove has a line of white-coloured feathers running on each side of the neck; the Collared Turtle Dove the same, but of a black colour. The true Turtle of the Holy Land has also this mark on the neck, as well as a number of the smaller foreign Doves, still they are not connected with one common parent. Our theorists give no examples, no dates; their reasoning is ingenious, but more cannot be said for it. After all the writings and readings of scientific works on this subject, we are no wiser to-day than our great-grandfathers were, who had not the opportunities possessed by us.

Time prevents me going further at present, and I must have regard for space, but in an early issue I hope to forward my ideas of the origin of fancy Pigeons under the title of "Selection No. 8."—J. HURD.

#### BELGIAN CANARIES.—No. 8.

BELGIAN Canaries when sent for exhibition should be placed in wire cages, wooden or box-cages being ill-adapted to show-off their points to advantage. They being of a somewhat retiring or steady nature, compared to most other breeds of the Canary, will, when exhibited in cages having wooden sides and backs, seek the ends of the perches nearest the back of the cages, and it is with some difficulty that the person appointed to judge the birds can succeed in getting them into proper form so as to

fully convince him as to the merits or demerits they may possess. Not so, however, when they are shown in wire cages, for then when properly handled they are under certain command, and true Belgian position may be the more fully developed.

I have said "when properly handled." Some may imagine I intend this remark to apply to the birds. Not so, it is the cages I refer to. The mere fact of looking at Belgian birds upon the stage amounts to very little. They require an attentive scrutiny, and each cage should be lifted off one by one steadily and with the greatest care. If upon the first approach to any particular bird you find it exhibit a temporary nervousness, or inclined to become fidgety or flighty, leave it alone and pass on to another. The bird will gain a little confidence by the time you next approach it, with your hat off as a matter of course.

There is a vast difference in the appearance of Belgian birds. Some when at ease and undisturbed will possess good general position; others require getting into position, and it is sometimes necessary to "fiddle" them up somewhat ere you can bring them to your liking. The birds not only require to be looked at in your hands level with your face, but held up somewhat higher than your face to see that they are neatly formed from chest to vent, being well braced-up, or as a Nottingham fancier once remarked to me whilst examining a clipping specimen, "He's a one rap'n, George." I replied, "Yes, he is," for I always allowed Mr. William C— of Nottingham to be a judge of Belgian birds. I formed this opinion from the time he showed me some of the best Belgian birds I ever witnessed, at a place known as Robber's Mill, in the suburbs of Nottingham. It was there I saw the very best Buff Belgian hen I ever have examined, and I believe that the aforesaid William C— had something to do with the famous Buff cock (the Crystal Palace champion of years past), I referred to in a previous chapter.

But I am diverging somewhat. In picking-out the points of a Belgian you must not only look at the bird straight and up at it, but lower it to your waist, holding the cage in both hands and taking a glance over the bird. By this means you will the better mould the bird's points and positions in your eye, and be enabled to arrive at the conclusion as to which are entitled to your choice. To some this may appear tedious, but such is the nature of Belgian birds that it is necessary to exercise patience and time. But some birds are quickly decided upon.

If a Belgian bird becomes suddenly frightened, and during a temporary paroxysm should dash about the cage, that bird requires steady to its perch and work before its merits can be decided upon. One matter in particular, often thoughtlessly committed by visitors to bird shows, is that of suddenly pointing the finger close to a cage containing some bird of special merit. I have known serious results and even deaths to ensue thereby.

It is better when Belgian birds in particular can be conveyed to an exhibition under the immediate care of the owner or some person deputed to see them safely delivered in the show-room. They would thus escape the ruthless tumbling about they sometimes have to encounter whilst being conveyed by rail. I have been concerned frequently by witnessing at railway stations hamper of cages containing birds turned and tumbled about upside down, and any other way, regardless of the frail occupants, whilst being transferred from the parcels' van to the platform.—GEO. J. BARNESBY.

### THE BEE SEASON.

THE unprecedented wet weather is likely to create a famine among the bees. The accounts that reach me from various parts are deplorable—plenty of bees but no honey. One man from Buckinghamshire, an extensive bee-keeper, although a cottager, tells me he and his neighbours do not know what to do with the bees, and would sell a quantity at 6s. per hive, for there is no other fate in store for them but starvation or brimstone. My hopes of supers are almost gone. Three weeks ago I had several looking promising, but instead of growing heavier I have had the mortification of daily finding the honey vanishing. How our honey fair and show will come off in September I do not know, although I have heard of some very fine supers filled from the fruit blossoms long ago. Let every bee-keeper look to his swarms and stocks, and feed them where light. Few are conscious of the enormous loss of bee life when weather is bad even for a few days. Although there may be honey in the hive the bees will not let their young mature if no food comes in—that is to say, not to the full extent of natural increase, and this is more especially the case with weak stocks which want population most. As an instance I will mention that in a unicombed hive in which I was carrying out some experiments on the 14th, 15th, and 16th of July, I noted twenty cells in which I saw the queen lay eggs, and on the 25th of all these cells but one or two (I was doubtful of the identity of one) contained a tenant. All the others, some of which I had previously seen with larvae

were empty, and inspection of the comb convinces me that destruction more or less had taken place all over the hive, and which I have no doubt will be confirmed a short time hence by the diminished population.

By means of this same hive I have been curiously noting the transformation of a stock of black bees into Ligurians. On Whit-Tuesday evening I released into the black stock a Ligurian queen, whose first young bees emerged on the morning of the following Sunday fortnight, eighteen days and a half only having elapsed since the first egg could have been deposited. The following day many Ligurians appeared, which they daily continued to do, and the blacks to diminish, until on the 20th ult. I could not find a black bee in the hive, as some of the black queen's eggs had only been hatched six weeks. This time may be taken as the limit of the worker's life in summer. It was also interesting to see how the old bees were pushed out in the cold by the more youthful. For several days before the last disappeared the poor blacks were always to be found at the bottom of the comb, being, I imagine, jostled out of place by their stronger sisters. Helping the distressed is evidently not a bee's virtue, unless, indeed, a sister bee is clothed with honey, when self-interest induces them to lick her clean to mutual advantage.—JOHN HUNTER, *Eaton Rise, Ealing.*

### DRONE MURDER.

ONE would fancy that the year 1875 has been one of great disappointment and suffering to drone bees. They seldom leave their hives but in fine warm weather, when they take long excursions into the country. Drones travel one or two miles at least farther from home than working bees. The inclement weather has kept them much at home this season. Their lot and history at best are not enviable; their sufferings and doom, when seen and understood, excite feelings of commiseration. Many times this year have we felt touches of sorrow for poor drones famishing together in huddled masses on the boards of their hives from sheer hunger and want. Driven and kept from the honeycombs in their hives by the bees they have been hungered to death. Why they are not killed outright, or more mercifully dealt with, no one is able to say. Some theorist may ask, "Is not murder by starvation resorted to, to save the stings and lives of workers?" It may be so, but so far as we know it has not been proven that bees lose their stings when killing one another. One thing we are sure of is that the bees of one hive have killed an equal number of strangers clumsily cast amongst them without apparent injury to or the death of one of themselves. If bees kill bees without apparent injury to themselves, and queens kill queens without suffering, why not drones be destroyed by stinging? We are not given to theorising and offering explanations of things unknown, and there are many secrets in bee history yet unfathomed, and many that never can be fathomed; and this slow process of drone-destruction methinks is one of them.

Even the massacre of drone life before birth though explainable is a wonderful thing. When bees are short of provisions, when in times of scarcity the bees find that their stores are nearly exhausted, they almost invariably tear the unhatched drone brood out of the cells and cast it overboard. In times of threatened starvation the bees do what they can to stay the evil day by destroying the most worthless members of their community. The loss of unhatched drones in itself may be considered an advantage, but it should be remembered that when bees approach or come to the verge of starvation they wisely refuse to set worker eggs. When bees ready to swarm, so far as numbers go, find their stores nearly all done, and weather unfavourable for gathering more, they generally cast out their white drones and set no eggs of any kind. They are thus cast back about three weeks, and they let weaker hives run ahead and swarm before them. The appearance of white drones outside of hives in the months of May, June, and July is a most striking indication that their inmates are on the borderland of starvation.

Many people are now wondering why their first and early swarms are casting out white drones by the handful. If they would but lift or weigh their hives, or otherwise examine them, they would find that they are on the confines of death. Much as one feels for poor drones on seeing them hungered to death, more is felt for the industrious working bees when they are neglected and starving. When weather is favourable for honey-gathering, or when they receive kindly and considerate treatment in the day of adversity from their masters, bees do not cast out white drones.

The first day of this month found hives in this neighbourhood in a much more unpromising state than they were on the first days of June and July. We repeat with emphasis the watchword given two weeks ago—viz., "Attention to feeding." Last year we resolved to reduce the number of our stocks to six or eight, which should be kept always at home for experiment, for what was once a pleasure to us is now a toil, such as taking three scores of hives to the Derbyshire hills. My resolution to lessen the number of our stocks was partially carried into execution.

## WEEKLY CALENDAR.

From observations taken near London during forty-three years, the average day temperature of the week is 73.5°; and its night temperature 50.5°.

## VARIETIES OF PERFUME IN THE ROSE.

AMONGST the whole world of floral productions surely there is no one flower so acceptable to mankind as the Rose; and this not so much for beauty of form, colour, and the exquisite infolding grace of its petals as for its proverbial sweetness. For bringing the subject of fragrance prominently before your readers we are indebted to our friend Mr. Camm, and doubtless we shall be no less so to our valuable Rose friend Mr. Hinton when he has gathered up and classified all the Rose hints and sweet varieties in the proposed election of sweet Roses. My object now in troubling your readers with my contribution is that the proposed election may have some kind of scientific classification that may be useful to us in a future consideration of the subject. A sweet Rose conveys to my mind an agreeable fact, but were that sweetness to be described it would lend much more interest and intelligence to the fact. Descriptive Rose catalogues could then be made much more intelligently descriptive on the one important subject of fragrance. Our French neighbours are very lively and imaginative in their varieties and descriptions of colouring. When our olfactory senses are in good training we may discover nearly as many shades of scents as there are shades of colour in the Rose; at any rate, a most interesting field of study would be opened up by first classifying the types of scent and then tracing out their hybrid subdivisions. In sweet-scented Roses we must all take an interest, and I am sure none more so than our lady gardeners, whose delicacy of discrimination in all matters of perfume will be of the greatest assistance.

The well-known perfumes of flowers, such as Mignonne, Musk, Heliotrope, Verbena, Violet, Orange blossom, and the like, all elaborated from the same elements, are, to my mind, very wonderful; they, however, keep their own peculiar scents all the world over; but the Rose, queen of all, is unsurpassed in the variety of its perfume.

Having during many years given much attention to this subject, I would endeavour to make a classification of distinct types of Rose scents, asking your readers to bear with me in this first attempt at classification, yet feeling sure to a highly-cultivated olfactory taste it is not overdone, that the families of Tea and Hybrid Perpetual might still further be subdivided in an interesting manner.

I would here enumerate some seventeen varieties, beginning with the well-known Sweet Briar:—

1. *Sweet Briar*—The garden variety.
2. *Moss Rosebud*—Common Moss and family.
3. *Austrian Briar*—Copper Austrian and family.
4. *Musk Rose*—Narcissus, Old Musk, and family.
5. *Myrrh*—Ayrshire Splendens.
6. *China Rose*—An astringent refreshing scent, old Monthly China, and many others.
7. *Damask Perpetual*—Rose du Roi, &c.
8. *Scotch Rose*—The early Double Scotch.
9. *Violet*—White Banksia.

No 150.—Vol. XXIX., NEW SERIES.

10. *Old Cabbage*—The well-known Double Provence.
11. *Otto Perpetual*—Charles Lefebvre, Mme. Knorr, &c.
12. *True Perpetual*—Cécile de Chabillant, Pierre Notting, &c.

13. *Old Tea*—The old yellow Tea or Magnolia Rose, and others almost unpleasantly strong for some tastes.

14. *Sweet Tea*—Goubault, Maréchal Niel, &c.

15. *Hybrid Tea*—La France; Bessie Johnson is closely allied to this.

16. *Nectarine or Fruit-scented*—Socrates, Jaune Desprez, Aline Sisley, &c.

17. *The Verdier*—Represented more or less by all the Victor Verdier hybrids, such as Eugénie Verdier, Marquise de Castellane, Comtesse d'Oxford, Mdle. Marie Finger, and very many others of recent introduction. Some compare this slight but peculiar perfume to that of Apples. I think it might be described as a delicate Rose scent with a suspicion of turpentine about it not unpleasantly blended.

The petals of the highly-scented varieties have on their inner surface minute perfume-glands or vesicles containing the highly volatile essence under the microscope distinctly visible; those on the foliage of the Sweet Briar almost to the naked eye; so that with the aid of the microscope and good olfactory practice the interesting question, Which are the sweetest Roses? may be readily settled. To my taste, and by the same rule, the following are the most deliciously and powerfully scented:—La France, Goubault, Devoniensis, Maréchal Niel, Bessie Johnson, Madame Knorr, Pierre Notting, and Charles Lefebvre. As a rule, nearly all the dark Roses are sweet-scented. To unstop Nature's finest bottle of Rose, remove the cap in hot weather from a "pasted" full-blown bud of La France, or even of the old Cabbage Rose, the flower will instantly expand, throwing out a surprising volume of fragrance. Roses after they have been gathered a short time appear to give off more perfume. Again, Roses blooming under glass usually give off more scent than those of the same kind blooming in the open air.—

HENRY CURTIS, *Torquay Rosery.*

## NOTES ON A FEW PEARS.

I THINK I know the gentleman alluded to by Mr. Taylor as a grower of Pears in Yorkshire. If I am right in my conjecture his name begins with M, and that of his village with G. Assuming this to be the fact, I venture to assert that that gentleman's garden is worth going fifty miles to see as a pattern at once of neatness, fruitfulness, and good management. There is not a foot of wall wasted, and his trees bear to the very ground. Before I went to see his garden I was conceited enough to suppose that I knew something about the growth and management of Pear trees, but a walk through his garden in his company most effectually dissipated that notion, and I came home with much humbler ideas of my own management.

But to return to Pears. First, of the Beurré de Capiaumont. It is given as a baking or stewing Pear in Rivers's catalogue, and is sold in the Manchester market for a

No. 1402.—Vol. LIV., OLD SERIES.

Pear of second or third-rate quality; but with me it is not only an extraordinary bearer, but of first-rate quality, although when in perfection it keeps but a very short time. When I first fruited it I stored it in a cool fruit room, and it always remained turnipy and tasteless. Now, as soon as gathered, it is hanged up in a warm room where the temperature is never below 60° Fahr. and frequently 70°, and in about ten days or a fortnight it is perfectly melting and high-flavoured, but very soon decays. The same treatment applies to *Beurré Clairgeau*, which with me is very good so treated, whilst its fertility is as remarkable as is that of *Beurré de Capiaumont*. I learn also (although I have not proved it) that *Beurré d'Amanlis* is much improved by the same treatment.

*Beurré de Rance*. This Pear requires peculiar treatment here. My first attempts to mature it were failures. As I had found that warmth was essential to the maturation of the *Beurré de Capiaumont*, I tried it with the *Beurré de Rance*, and found that it dried up without melting. The next season, I put the crop in a large earthenware jar and put on a cover, and set it in a warm room. At Christmas, thinking my Pears ought to be ripe I opened the jar, and then discovered that the moisture which evaporated from the Pears had condensed on the cover and falling back on the Pears had rotted them all. I now adopt a modification of this plan. I put the Pears in the jar, but only allow them to remain there a month, and the maturation having then fairly begun it goes on, and they are very good about Christmas; but my neighbour (the vicar of Whalley) by keeping his in a cool fruit room has them in perfection in March. Whether the soil has anything to do with this I do not know, but my trees grow in something like a clay puddle.

*Beurré Bosc*, *Beurré Superfin*, and *Marie Louise* are always good, and so is *Thompson's*, but this last is a shy bearer with me out of doors; in the orchard house it bears profusely. All my previous remarks refer to trees against east and south-east walls. As standards they would be worthless, even the *Seckle* and the *Beurré de Capiaumont* as standards are mere Orbs. As wall trees, and adapting the treatment of the fruits after being gathered to the varieties, I manage to have some good fruit every year, but shall be glad of a few more wrinkles.—T. G., *Clitheroe*.

### A VISIT TO PILTDOWN.

HAVING often desired to visit the Messrs. Mitchell's well-known nurseries I have at length accomplished this during a visit to Eastbourne. Uckfield is their railway station, from which Piltown is a pleasant drive or walk of two miles and a half. I was surprised to see so many fields of Hops on the roadside.

"Until St. James is past and gone  
There may be Hops and there may be none."

St. James is now most unquestionably past, and it is happily also certain that there will be Hops.

The first object that catches the eye on approaching the nurseries is that magnificent *Araucaria*, one of the finest in England (two stand together by the roadside), thirty-two years old; of which the finest, with the figure of its late owner standing beside it, was at one time very familiar on the cover of the Mitchell catalogue. It was a melancholy feeling, having to pay a first visit and to find him gone who had so often invited it.

"Redit on placidum moroseque benigni."  
(Remembered is the calm face and manners kind.)

The portly form and pleasing manners seemed brought irresistibly back to me.

After a most hospitable reception and excellent luncheon, to which I was welcomed by the widow of my old friend, I sallied forth with the two young proprietors on our tour of inspection. The Rose Farm, as Cheshunt was happily entitled by a relative of my own on a late visit there—the Rose-growing space here is about forty acres—not, of course, that the whole is under Rose culture at one time. The soil is sandy, with clay underneath, I apprehend an unusual but very convenient combination; while on one side three acres bordering on a large adjacent Rhododendrons are chiefly peat, and appear to grow very excellent Rhododendrons.

At first, as in duty bound, I went to inspect the Pinasters, of which I know so little that mentioning them at all is a perilous undertaking. The *Araucaria* avenue is a marvel, and in memory a joy for ever. The trees of this class are wonderful, and such a long double row of them, and of such size, is,

I understand, nowhere else to be met with. They seed freely at Piltown, and a considerable number of fine young seedlings are in process of raising. Fine specimens of the *Retinospora pisifera aurea*, *Thuja dolabrata*, and a variegated *Weldingtonia*, a sport raised at Cork, are to be seen among many others.

Having thus, like the school children, disposed with all haste of the bread and butter first, I come now to the cake—i.e., the Rose department. I had been apprehensive that Dame Flora, like most other ladies, would be taking an outing in August, and that there would be comparatively little to see, but my first glance over the hedge when approaching quite put an end to that fancy. Nowhere and at no time have I seen a more beautiful collection of Teas; budded on the low Brier they are grown to very great perfection, and were at this time full of bloom as well as shooting very strongly. Among old friends *Madame Blacket*, *Moiret*, *Niphotos*, &c., were in great beauty. *Belle Lyonnaise* and *Madame Berard* I found were held in great favour; they are certainly much the best seedlings we have yet had from dear old "Glory" as it is sometimes called. *Jean Pernet*, good. *Duc de Magenta*, an improved *Robson*. *Le Nankin*, a delightful new yellow, which everyone should have. And, to mention but one more, *Souvenir de Paul Néron* received, and certainly merited, very high commendation. It appeared something like a much stronger and more free-growing *Madame Bravy*.

Among the H.P.'s *Capitaine Christy* was very good, *Mdlle. Bonnaire* quite strong and free-growing as a standard. What white Rose can come near her when really well grown? The Shah was well spoken of. *Mdlle. Marie Finger*, fine. The Duchess of Edinburgh (H.P.) we agreed was disappointing, but to mention all the beauties would be to transcribe half the catalogue.

English seedlings are now coming so fast to the front (at Cheshunt they appear to have almost a glut of these), that I made especial request to be conducted to that department. The Messrs. Mitchell have several which they have worked on Briers, and which will no doubt apply for certificates in due course. Before long they will, I incline to think, be very likely to introduce us to good English Tea Rose seedlings. In Tea Roses their special strength lies, and of these we have at present a very limited number. They intend this year, if the sun allows, to have a considerable sowing.

After fresh hospitality I concluded a most pleasant day by returning to Eastbourne with a box of irresistible Roses, and strongly recommend, to all who can manage it, a similar excursion.—A. C.

### THE MORELLO CHERRY SHORT-PRUNED.

I ADMIRE Mr. Taylor's trenchant Saxon—it is straight, plain, and practical. I have profited by the instructions he has given, and have been able to confirm much that he has advanced; but I cannot endorse his simile at Mr. Abbey's expense, that it is as reasonable to train an Oak tree on a balloon trellis as to cultivate the Morello Cherry on the spur system of pruning. I grant that the laying-in of young wood is the mode suggested by the tree itself, and by that plan immense crops of fruit are produced; but I also know that immense crops are producible when the tree is managed on the spur system of pruning.

The finest trees I have ever seen are trained on the fan-shape, and the branches are regularly and closely studded with spurs formed by systematic summer-pinching. The fruit from these trees is also the finest I have ever seen, and is produced in great abundance, and, further, if I am not mistaken, a greater amount of fruit is provided at a lesser outlay of labour than by the orthodox system of laying-in the young wood. The tasking-in of young wood and the cutting-out of old wood is a tedious process, and, as a consequence, we find in gardens where work presses that the Morello Cherry trees are worse tended than any other trees. Trained on the spur system the summer dressing and winter pruning is quickly done, and it is certain that by this plan a satisfactory and abundant supply of superior fruit may be produced.

The trees managed on this system which I am acquainted with are, in my opinion, models of good culture. The branches are just so far distant from each other that the foliage of one branch does not overlap that of the next (a golden rule in "judging distance" in tree-training), and the branches 20 to 30 feet in length are wreathed with fruit from base to extremity. Not a fault is to be seen in these trees, neither by

excessive crowding nor bare patches, and they afford proof absolute and incontrovertible that the spur mode of treating the Morello Cherry is not only practical but profitable.

I think the system is worthy of extended adoption, as leading to trees not only more handsome in appearance than are those generally met with, but as requiring less time in routine management, and in producing fruit both abundant and fine.

I know nothing of the Black Currant on the spur system, never having proved it, but I do know trees of Morello Cherries which have been closely pinched for over twenty years, and judging them by their fruit I have never seen trees to equal them in value; and I think that if other cultivators will test the practice they will agree with me that the plan is recommendable.—A NORTHERN GARDENER.

### A CORNISH ROSARIAN'S NOTES.

THE taste for "whoppers" in Roses is, Mr. Badolphe tells us, "a coarse taste," but in his list of select ones for button-hole purposes he names amongst others "fully expanded" Charles Lefebvre, Duke of Edinburgh, and Marguerite St. Amand. This looks uncommonly like "whopper" worship. He must surely have had in view the decoration of some gorgeous "Jeannes," such as Leech's pencil has immortalized, or the tribe of portly coxcombs whose floral adornment sometimes takes the form of Hollyhocks and Sunflowers. Ordinary mortals, however, may well be content with Homère, Camary, Devonianensis, Safrano, Jules Margottin, Louise Wood, and the Moones in bud, and with Céline Forestier, Boule de Neige, and one or two others partly expanded.

Fragrance in a Rose is undeniably a very valuable quality, but it seems to me Mr. Pesch puts it fairly when he says, "We think far more of beauty of colour, form, and freshness, to say nothing of size, so long as it does not lead to coarseness, than we do of mere scent;" and in the Journal I see he has since laid down the distinction between size and coarseness clearly and soundly. The odour of the Teas as a class, delicate as it is, strikes me as being inferior to that of the Perpetuals of the Marie Reily, Senateur Vaisee, and La France class with their rich fruit-like perfume, and to the honest scent of the old Cabbage; but *chacun à son goût* here too.

Mr. Camm in his article on "cut-backs" plainly states what I think will be found to be the experience of most growers. I have never yet seen a batch of maiden plants, as a whole, carry blooms comparable to those from the same number of cut-backs. Mr. Baker's plan I have pursued, and can recommend where it is practicable—viz., three quarters: one for stocks, one for maidens, one for cut-backs; and then, whether you have exhibition stands or simply garden decoration in view, the continuous supply this plan affords meets both. Mr. Baker's victories show what an amateur may do, and if he would let us know how many plants he has under cultivation we should be the better able to estimate his success.

Mr. Pesch says, "Under proper cultivation Roses on their own roots will also give quite as fine blooms as on the Dog Rose." Is this so? We see little or nothing written about Roses on their own roots. I rear some annually, but cannot say much in their favour for high-class flowers. I shall be glad to read the experience of others.

Mr. Lachhurst, in some notes on Tea Roses, says of Triomphe de Rennes, "Pretty little flower of a delicate yellow shade, but is unworthy of a prominent position." Just the opposite of this would be my comment on this Rose; its blooms with me are frequently 4 inches across, and on the Briar especially it is vigorous, free-flowering, and well worthy of a "prominent position" in any collection.

As to Madame Lacharme, whatever doubts may hang about her reputation one thing is certain—she continues to make a number of people agree to differ. Hitherto wherever I have seen this Rose in this moist part of England it has shown itself unfit for outdoors, but I can understand that under glass it may be valuable. I have tried it on the Manetti and on the Briar, and on neither has it behaved as a Rose ought. The flowers, which have persisted in not passing the half-open state, showed tokens of a modest discernment which were creditable to them as compared with the conduct of the soiled shabby-looking flowers that did open.

Mr. Mayo, in No. 735, says that he included Felix Genaro in his list of last year's election of best fifty, but the published list does not bear him out.

Mr. Beasbey, in one of those pleasant contributions of his in No. 729, speaks of "cutting Roses if you are so minded

every day of the year." Will he and others who have paid attention to the best form of house culture give us a few notes under this head?

I had written a few notes about the Devon Rosery, where I recently spent a few pleasant hours with Mr. Sandford, the energetic and intelligent partner of Mr. Curtis, but they have been mostly anticipated by "D., Deal's," narrative. I think the nursery will be better worth seeing next year, for a finer lot of stocks than the budders were upon I never saw, and the season has so far been favourable; whilst in last year's work there were many failures. A fortnight back no Rose in the establishment would compare with Capt. Christy; the plants were superb. If the bloom of this Rose were inferior instead of being superior to most, it would be then worth growing for its ample, deep-coloured, finely-shaped foliage. François Michelon, Etienne Levet, and Capt. Christy were, I found, being propagated to the utmost; of the latter I noticed six hundred stocks in one plot. Marquise de Mortemart I never saw before as I saw it there. Its blooms, in spite of the delicacy of the plant, were sufficient to induce anyone to try it. It was grown next to Madame Lacharme, and the Madame was nowhere. Cheesnut Hybrid much struck me. If this be a true Tea its colour, substance, and vigour ought to be turned to good account. I fancy it has a tendency to coarseness; some of the flowers reminded me somewhat of Anna Alexieff.

"D., Deal," speaks of the demand for cut blooms, and I found that for about a third of the year they usually sell sufficient to pay their weekly charge for wages of about £15. Mr. Sandford also told me their trade had so increased that they were in treaty for an additional three acres of ground adjoining the present seven.

"D., Deal," praises the scenery of Torquay and its neighbourhood, and beautiful it is. After I left the rosery I strolled down the Torre Avenue with its grand Limes in full bloom; and as the soft air swept up from Torbay, bringing with it their sweet fragrance, and the soft murmur of the bees in their delicate tassels, it recalled snatches from the choric song of the "Lotos Eaters" and its associations of beauty and repose. But although you may "hear the cuckoo and the blackbird close to the very shore," and the coast be "clothed to the water's edge with luxuriant foliage" here, yet to one on a summer's holiday I would recommend by way of contrast the experiment of going, as I did, by the nearest route from Torbay and its semitropical pictures to "Intagel by the Cornish sea" and to quaint Boycastle, the Eglogian of "The Three Feathers," and its wild coasts. It may be the partial judgment of one who believes strongly in the beauties of his county, but I will venture to predict that the scenery of the latter will give the truest enjoyment. The bluff headland and the towering cliffs, the calm inlets, the cry of the sea bird, the breezy downs with their Heather, Gorse, and wild Thyme; and above all, before you always the sea in its full sublimity, recalling not the Sybaritic ease of "Lotos Eaters" but the prowess of a race of sea kings. These I regard as far away beyond anything Torquay and its neighbourhood, lovely as it is, have to offer.—*CONNUZZI.*

### SHIFTING GREENHOUSE PLANTS WITHOUT INCREASING THE SIZE OF THE POTS.

SHAVING an inch off the root-bound ball of earth, moulded by the pot in which the plant has been grown, is recommended by Mr. Douglas on page 99, and by "S. W." on page 118. No further testimony is needed as to the practicability of the plan. I have adopted another mode principally with Azaleas, and nothing could have answered the purpose better.

The plants for want of support were in anything but robust health; they plainly required larger pots; but these, for special reasons, could not be given them. Not having them head of the slaving process, I adopted the following plan of giving fresh soil.

Instead of slicing the earth all round, I with a sharp knife cut out three equidistant wedges, commencing at the top of the balls and cutting down to the bottom, after the manner of carving a piece out of a cheese. The balls were returned to the pots, and fresh soil was rammed firmly into the spaces from which the wedges had been taken. The plants improved considerably, and the following year wedges were cut from other portions of the balls and their places occupied with fresh soil, and the plants were brought into perfect health without any increase in the size of the pots. The plants were not in the least injured by the operation of cutting. By continuing the

practice year by year plants may be kept healthy for an indefinite period without changing the pots in which they are growing. This in the case of plants which have to be fitted into ornamental receptacles is a matter of great importance, and the modes mentioned can hardly fail to be useful to a large number of cultivators.

Whichever plan is adopted it is important that the ball of earth is not dry at the time, or the water will not afterwards penetrate it, but will run in channels through the fresh soil. For the same reason, also, it is important that the new soil be made firm—as firm, if possible, as that of the old ball. A complete renovation of the plant will then follow without materially increasing its size.

By the plan stated I had Azaleas in 7 and 8-inch pots for ten years in a satisfactory state of health, and I have not the slightest doubt that the same plants can be kept healthy for another ten years without increasing the size of the pots in which they are growing.—EX-EXHIBITOR.

### HYDE PARK.

ALTHOUGH the continuous showers which fell in July have left their marks on many plants—fostering a coarse growth in most of the Pelargoniums, and imparting a gross habit to Lobelias—still, despite these drawbacks, Hyde Park has probably never been more effective than it is at the present time. It is worthy a visit by all who are interested in garden decoration, and will afford both pleasure and instruction to most examiners, and an acknowledgment from all of the general high-keeping which pervades the ornamental department.

Entering by the Marble Arch to glance at the series of beds parallel with Park Lane we find that, in addition to the rain, the shade of the trees has checked the growth of the edgings of *Alternantheras* on the one hand, and has induced a preponderance of foliage on the Pelargoniums on the other. Under these conditions the old variety *Venus* shows to advantage, but the yellow foliage of *R. Fish* and *Creed's Seedling* is of a dingy greenish hue. *Murillo*, a glowing crimson Nosegay, is clearly an effective bedder, being rich and free; and *Vulcan*, an orange-scarlet Nosegay, is very bright but irregular in growth. *Chilwell Beauty*, rosy crimson, is distinct and fine; *Mrs. Mernier*, of the type of *Rose Rendatler*, as here seen is no improvement on the old variety; but *Master Christine* is fine both in truss and colour. *Shakespeare* is a very effective orange scarlet, free, and with bold trusses; and *Mr. L. George*, glowing crimson scarlet, is very rich. *Mrs. Stubbs* is also a good crimson Nosegay. *Mrs. Turner* has immense trusses of rich deep pink, and although the growth is irregular its effect is very striking. Of the Gold Bicolors the best beds are *Black Douglas* and *Golden Harry Hieover*; *Beauty of Calderdale* and *Perilla* being coarse and overgrown. Many of these beds are edged with *Verbenas*, but the season has not been propitious for their growth.

Commencing at Grosvenor Gate we find some very fine beds. Great improvements have been effected here. The turf on which the beds are formed is made to slope towards the centre, along which are plunged a row of specimen Bays and stately Palms. These are in admirable health, and the beds, which are arranged in pairs along both sides, are well filled. It is futile to attempt a description of the tapestry beds, which are elaborate and well finished, and which require more than a passing glance. Of the Pelargoniums, *Lady Emily*, which is so fine as a pot plant, is not good here as a bedder; but *Amaranth* is remarkably fine. *Mr. Gibbons*, a rich pink having a fine truss, is also very good; and there are fine beds also of *Cleopatra*. *Sibylla* is another good pink variety, and *Culford Pink* is distinct in this section. Amongst the high-coloured sorts *Fire King* forms a splendid bed, and *Briton* is intensely scarlet and very tall. General *Outram*, *Wellington*, and *Bonfire* are all valuable bedding varieties, being good in habit, floriferous, and rich. One series of these beds is edged with *Albion's Oliffs* silver variegated Pelargonium, *Iresine Lindenii*, *Lobelia*, and *Echeveria*, and the other with *Lobelia White Perfection*, *Alternanthera*, and *Golden Feather*, and these edgings by their extreme length are very beautiful. In some instances the old *P. Manginii* is employed as an edging, and is very satisfactory; but *P. L'Elegante* is a complete failure. There are also some mixed beds, which afford agreeable relief to the formal masses and rigid lines of colour. Palms brightened with *Calceolarias*, *Perilla* and *Golden Abutilon*, *Gesania splendens* and *Iresine Lindenii*, *Golden Pelargonium R. Fish*, and *Purple Verbena* are the best examples of these combina-

tions. Beds of *Coleus* are, fortunately, not numerous, and the plants have scarcely moved since they were put out. Taken altogether there are fewer blanks than could reasonably be expected, and the general neatness of this part is creditable to those who have the charge of it.

In what is known as the subtropical department are some fine beds of flowers. A large bed of *Erythrina* in variety is just putting on its coral dress, and in pleasing contrast is a group of light *Fuchsias* edged with *Salvia argentea*. Beds of *Liliums* are just unfolding their thousands of flowers and filling the air with fragrance, and some *Pelargonium* beds are very fine. *Mrs. Turner* edged with *Purple Queen Verbena*, *Mrs. Kent*, *Colonel Wright*, *Mrs. Gibbons*, and especially *Oxton*, are varieties of *Mr. Pearson's* fine strain of the highest rank for bedding purposes. Associated with these are subtropical plants in profusion, *Rhododendron* beds in which are dotted *Lilium auratum* and banded with bright *Geraniums*, and standard *Acacias* based with succulents and *Alternantheras*, forming a varied feast of beauty, which on the undulated ground and beneath the shade of the trees is cool yet cheering, and particularly attractive.

On the broad expanse of turf beyond the drive are also some striking beds of a subtropical nature. These are large and isolated, and are very ornamental. We note, as composing one of these beds, large plants of *Seaforthia elegans*, *Dracenas*, and *Ficuses*, with an undergrowth of *Variegated Maize*, *Abutilons*, *Coleus*, and dwarf Palms; the whole bounded with *Pelargonium Bonfire* and edged with *Tussock variegata*. The bold foliage of this *Coltsfoot* and its clear white marking is exceedingly fine, not only for distant effect, but it will bear close examination. It is a hardy edging plant of the first order for large beds. Other beds are planted with *Ferdinandia eminens*, edged with *Eucalyptus globulus* pegged-down; *Ridinus*, edged with *Melanthus major*, and surrounded by *Pelargoniums*; and a bed of *Cannas*, banded with *Princess of Wales Pelargonium*, very fine cerise trusses; another bed of *Cannas*, surrounded by a zigzag of *Cineraria maritima compacta* and *Iresine Herbertii*, and edged with *Lobelia*, which is remarkably effective; also good beds of *Golden Pelargoniums Harry Hieover*, *R. Fish*, and *Creed's Seedling*.

In contrast to this, where foliage and flowers are combined, is a charming example of subtropical gardening in the dell near the Albert Gate. This is both extensive and excellently done. It is an admirable example of tropical scenery. At the bottom is the stream flanked by Ivy-mantled banks, along which the *Osmunda regalis* grows luxuriantly, and stretching beyond is the rising ground lightly studded with forest trees, up the trunks of which is trained the *Monstera deliciosa*. Between these are grouped tall specimens of *Dracena australis*, *Mosses*, and tree Ferns. *Cyathea*s spread their noble fronds over the smooth turf, which is further studded with Palms and *Cycads*, and lightened by groups of *Arundo donax variegata* and *Phormium tenax variegatum*. From the base of these variegated plants rises a group of *Aralia spinosa*, and at the visitor's feet are bright beds of *Pelargoniums* of *Rose Bradwardine* and *Triomphe de Stella*. The whole arrangement is a triumph of decorative art, and those who have planned and those who have executed it merit the approbation of all lovers of high-class decorative gardening.

If the prevailing showers have dimmed the bloom of the flowering plants, they have more than compensated by decking the park in a spring-like robe of green, and in furnishing a setting to the picture which to be seen is to be enjoyed and appreciated.

### NECESSITY THE MOTHER OF INVENTION.

ACQUAINTED to a good garden, which, thanks to this Journal, every year becomes more productive as well as more attractive, I find myself in a country vicarage where "the Leeks, the Garlic, and Onions of Egypt" are supposed to abound, but unhappily do not. Surveying my resources for a month's sojourn the day after my arrival, I observe a few rows of Peas which seem to have almost done their work, and certainly are past their prime; there are in addition some Kidney Beans which evidently intend to bear as soon as I leave. I wonder whatever is to become of me and mine unless we can contrive to exist either on Carrots, of which the supply seems scanty, or on "Taters," as certain rustics call them. A few days have passed, and already I learn that I am better off than I supposed. A dish has been brought to table which looked rather like a kind of Cabbage, but was not. Challenged to try it,

mixed with melted butter and seasoned with salt and pepper, I was compelled to call it excellent, and yet could not guess what it was. "Boiled Lettuce," was the triumphant reply; and I strongly advise those who have nothing left of the Cabbage kind in their garden to try boiled Lettuce! The fox in the fable advised the other foxes to make themselves like him and to cur-tail their dimensions; I advise your readers to add boiled Lettuce to their list, and so increase their resources.

The dish, I am informed, is by no means an uncommon one in France, and syrup of Lettuce is accounted among our neighbours there to be a good cure for coughs. I cannot but think that our poor people would not waste their Lettuces as they often do if they knew that, even when running to seed, they make an economical and wholesome dish.—E. M. B. A.

#### NOTES BY A ROSARIAN.

I HAVE been too much out of health to run about to Rose shows this year, so I have read greedily the many letters on Roses in the Journal. So much has been written that I felt inclined to say nothing; but your number to hand, with its two letters on our favourite flower, induces me to trouble you with another letter on the old subject. I will try and condense my remarks as much as possible.

First as to cut-back Roses I entirely agree with my friend Mr. Camm. On this soil, and it is a perfect Rose soil, I have all my best blooms from cut-backs; in fact there are many Roses, such as Dupuy Jamain—this year one of the finest Roses in my collection—which I never grew good on a maiden, either Briar or Manetti. They come too single the first year. I grow about 1500 plants, and bud one thousand every year. But the fact of cut-backs being the best will not release the real Rose-grower from the work of budding, as Mr. Duddridge truly says—there are many Roses that will not stand the transplanting, especially when accompanied with packing and a railway journey. I have this year had splendid blooms of Horace Vernet, Xavier Olibo, Marquise de Mortemart, and other tender Roses of the same stamp from plants budded in 1873 by picking off every bud in 1874 and earthing them up in the autumn so as to cover the bud a good 2 inches. I have also found the Briar cutting grow these weak varieties better than the Manetti.

*Tea Roses.*—Out of seventy varieties grown here I can recommend as the twelve best Souvenir d'Elise, Souvenir d'un Ami, Niphotos, Bougère, Rubens, Madame Willermoz, Marie Van Houtte, Comte de Paris, Cheahunt Hybrid, Catherine Mermet (Alba Rosea, Madame Sertot, Madame Bravy, which are identical), Souvenir de Paul Néron. As to Button-holes, I am surprised to see no mention of Madame Charles, a darker shade than Madame Faleot, David Pradel, Souvenir de David, a red Tea, Isabella Sprunt, and Rêve d'Or. These all force well.—EDWARD HANDLEY, *Glastonbury*.

#### BIRDS AND CATERPILLARS.

I HAD within the last few weeks a curious instance under my observation, showing how much gardeners are indebted to birds, especially to sparrows, for the removal of caterpillars. A row of Poplar saplings about 5 or 6 feet high had been visited by one or more females of the Puss Moth (*Dicranura vinula*), whose singular round eggs were freely distributed on the leaves in twos or threes. The caterpillars began to hatch-out early in July, and scattered about, as is their wont; a few dying, as frequently happens, within a few days after they had emerged from the egg. For two or three weeks there was nothing particular to record about them, but as they began to increase in size, becoming more perceptible on the leaves, there soon was perceivable a gradual decrease of numbers. The fields edging the road where these Poplars grow is frequently resorted to by small birds, which naturally suggested the idea that these had not failed to examine the trees. Several plump caterpillars that had just passed the last change of skin, and were to be seen sitting in their dignified attitude of repose, after they had demolished a good number of leaves disappeared suddenly. As it so chanced, I did not visit the spot for some days; when next I did so, at the commencement of August, there was scarcely a puss caterpillar to be found. The numerous bird-droppings on the saplings convinced me that the insects had been assiduously picked off by our feathered friends. Had these caterpillars been killed by ichneumon their skins would have been discoverable, or the cocoons of their parasites. Nor is it probable that they had all been

washed off the leaves by the heavy rains, even if a few had. The caterpillar of the Puss Moth holds on to a leaf or twig with singular tenacity, though lacking the hind pair of claspers found in most caterpillars. Indeed, so tight is the grip taken, that I have seen a hasty attempt to remove one end in the tearing away of the body from the claspers.—C.

#### GARDEN BROOMS.

In my recent peregrinations I have seen two useful garden brooms—one for sweeping the leaves off grass, the other for cleaning gravel. The grass broom (it is useful also for broad drives) I saw in use in the beautiful grounds at Drumlanrig Castle. The gravel broom I noticed at work in the Lower Grounds of Aston Park, Birmingham, which I am glad to see are being noticed in the Journal in a manner in which they are worthy.

As autumn is approaching, and with it the increased work of lawn and walk sweeping, a note of these appliances may be useful to those who know of nothing better than the old garden besom, and wood or iron rake, with which they clean, it may be, their acres of grass or gravel. With either of the brooms I am about to describe more than double the amount of work can be done with less exertion to the worker than can be effected by the implements usually in use. That is not an exaggeration, for, if needed, Mr. Thomson at the one place, and Mr. Quilter at the other can, I doubt not, attest to the correctness of the statement; but as being more convincing than that even, a gardener can make one and obtain the other and so prove their value for himself.

The Drumlanrig Duster—for that is an expressive name—is simplicity itself. It is made by the garden men in inclement weather or when wanted. A stout stick is cut 7 to 8 feet in length, forked at the tapering end. The tines of this fork may be a foot long, and their extremities may be about a foot apart (I speak from a passing glance, not having handled the broom). From point to point of the fork tines a cross-piece is tied, making a triangle. This forms the framework for tying on twigs of birch, which are done much in the form of a fan; indeed, the broom is a birch fan with a long handle. For dusting off leaves which lie lightly on grass or gravel, a more simple yet effectual contrivance than this cannot well be imagined. Of course, it is principally useful where a large expanse of ground has to be swept, and where the men have room for a full swing. Very few twigs of birch are needed for each broom; the number of these and their disposition may be left to the intelligence of an ordinary workman, who will comprehend at a glance now the idea is given him what a useful autumn friend is this Drumlanrig Duster. Make one and try it.

Now to the Birmingham Brush-rake, for that is exactly what it is. Imagine the head of an ordinary whalebone broom elongated to about 36 inches, and instead of being shafted, as is usual for brushing, affix a long handle in the side, and use the long-headed brush as a rake. The very mention of this brush-rake recommends the article, and it was surprising to see what a large expanse of gravel could be effectively cleaned in a little time. The head is, however, made lighter than the whalebone brooms which are in ordinary use. Both these simple garden cleaners are in the fullest sense labour-saving implements, and are worthy of mention and more general adoption.

It would be useful if others who have made an improvement in garden tools of any kind would describe them for the benefit of those who have more work to do than they have time to do it, and who have need of all the aids that can be rendered.—W. J. B.

#### CARNATIONS AND PICOTEEES AT SOUTH KENSINGTON.

READERS of the Journal would think on reading "D., *Deal's*," notes taken at South Kensington on the 21st July, that the flowers exhibited by me were "wonderfully dressed," and that if the cards had been removed the petals would have fallen down. Now, I can say that my flowers, to which four first prizes were awarded, were not dressed in the sense that "D., *Deal*," implies. When I opened the boxes at the Show Mr. Hooper of Bath and Mr. Atkins's gardener were present, and they both exclaimed, "What splendid flowers these would be if they had been dressed!" Mr. John Ball also told me they were very fine, but he also hinted that a little dressing would improve them. I pulled one out from the card to show that

the pod was sound, and the petals stood out as well without the card as with it. Some of the flowers had badly formed petals at the centre; these were removed—perhaps one or two in each flower, and the largest proportion did not require this; but every exhibitor would do the same.

No one would show a Pelargonium with bad trusses or badly formed flowers. Stove and greenhouse plants go under the same manipulation. Small and badly formed Grapes are also removed from the bunches, and even a badly formed petal is pulled out of a Dahlia; and "D., Deal," himself could not show where the defect had been.

But all this is very different from "plucking the centre out of a Dahlia," or "plucking and pulling" a Carnation to the extent of *deceiving* would-be purchasers. I can assure "D., Deal," that anyone with ordinary judgment might grow flowers and have them on their own plants the same as they were shown by me at South Kensington; and I thus publicly wash my hands from trying to deceive the public in the manner stated by your correspondent.—J. DOUGLAS.

### SALINE MANURES TO PREVENT THE POTATO DISEASE.

By a chemical analysis made by M. Sprengel it appears that 100,000 lbs. of Potatoes contain of fixed ingredients in lbs.—viz.,

Potash .....	300
Soda .....	324
Lime .....	88
Magnesia .....	33
Alumina .....	5
Oxide of Iron .....	23
Silica .....	34
Sulphuric acid .....	54
Phosphoric acid .....	40
Chlorine .....	154

Total of fixed ingredients ..... 814½ lbs.

My garden soil consists of a good rich loam well manured; but as I had in previous years found the disease amongst my tubers, it occurred to me, having reference to M. Sprengel's analysis, that both the soil and the manure I had employed might be deficient in potash, soda, lime, and magnesia, chemically prepared, and as I term them, "the astringent properties of manure."

In some measure to counteract the over-feeding effects of the sulphates and phosphates of animal manure which previously stimulated the growth of the Potato to a very considerable size, and produced at the same time a superabundant quantity of haulm and stem, I assumed that the careful supply of these fixed chemical ingredients would in some respect regulate, consolidate, and restrain the plant and the tuber in their growth, and by the formation of a healthy skin rectify the disease.

The favourable result has been that this year I have not found one bad Potato amongst my crop, although the market gardeners in this neighbourhood, without any exception, are suffering heavy losses amongst theirs.

These are the quantities which when well combined together are adapted for an acre of ground.

Potash (salt of tartar), 1 lb. ....	2 4
Carbonate of soda, 2 lbs. ....	2 6
Lime slaked (at 8d. per bushel), 1 peck ....	0 2
Magnesia, 1 lb. ....	2 6
	5 8

These being retail prices, the cost would be much less bought in quantity wholesale.

This compound reduced to powder should be carefully mixed together with the ordinary manure applied to an acre, and spread upon the land in the autumn, or at all events before Christmas time, for next spring sowing.

The amount to be used per acre may seem very small, but then it should be noticed that in this particular instance these ingredients are merely remedial, and are not required as fertilisers to stimulate quantity, but rather as a check to regulate and restrain the prurient growth of the Potato to maturity, and under more salutary influences to eradicate disease.

Such has been the effect upon mine this year—viz., to produce a yield firm, entirely healthy, and clear in the skin, of an average size, and not as previously was the case, some very large and others very small, and to curtail the leaf and stem.—CHARLES F. HAYWARD.

[The foregoing notes, written to the Rev. M. J. Berkeley, are extremely deserving of attention.

"The day has long passed when it was disputed whether saline bodies are promotive of vegetable growth. It is now determined that some plants will not even live without the means of procuring certain salts. Borage, the Nettle, and Parietaria will not exist except where nitrate of potash is in the soil; Turnips, Lucerne, and some other plants, will not succeed where there is no sulphate of lime. These are facts that have silenced disputation. Still there are found persons who maintain that salts are not essential parts of a plant's structure; they assert that such bodies are beneficial to a plant by absorbing moisture to the vicinity of its roots, or by improving the staple of the soil, or by some other secondary mode. This, however, is refuted by the fact that salts enter as intimately into the constitution of plants as do phosphate of lime into that of bones and carbonate of lime into that of egg-shells. They are part of their very fabric, universally present, remaining after the longest washing, and to be found in the ashes of all and any of their parts when subjected to incineration. Thus Saussure observes that the phosphate of lime is universally present in plants.—(*Sur la Végét.*, c. 8., s. 4.) The sap of all trees contains acetate of potash. Beet-root contains malate and oxalate of potash, ammonia, and lime; Rhubarb, oxalate of potash and lime; Horseradish, sulphur; Asparagus, super-malates, chlorides, acetates, and phosphates of potash and lime; Potatoes, magnesia, citrates, and phosphates of potash and lime; Jerusalem Artichoke, citrate, malate, sulphate, chloride, and phosphate of potash; Garlic, sulphate of potash, magnesia, and phosphate of lime; Geraniums, tartrate of lime, phosphates of lime and magnesia; Peas, phosphate of lime; Kidney Beans, phosphate of lime and potash; Oranges, carbonate, sulphate, and muriate of potash; Apples and Pears, malate of potash; Grapes, tartrate of lime; Capsicums, citrate, muriate, and phosphate of potash; Oak, carbonate of potash; and the Lilac, nitrate of potash. Let no one fancy that the salts are a very trivial portion of the fabric of plants. In the Capsicum they constitute one-tenth of its fruit; of Carrot juice one-hundredth; of Rhubarb one-eleventh; of Potatoes one-twentieth; whilst of the seed of the Lithospermum officinale they actually form more than one-half. Their constituents being as follows:—

Carbonate of lime .....	48.7
Silica .....	14.1
Vegetable matter, phosphate of lime, &c. ....	39.5
	102.3

These amounts of earthy saline matters are nearly as much as exist in human bones; but if we turn to the marrow, it only contains one-twentieth of saline matters; the blood only one-hundredth; muscle only one-thirty-fourth; yet no one will argue that these saline constituents, though smaller than those in vegetables, are trivial and unimportant."—(*Johnson's Science and Practice of Gardening*.)

These facts are evidence which cannot be controverted, that plants require a supply of different inorganic foods. Nor is the mode in which these are supplied a matter of indifference. Professor Johnstone proved this. A field of Potatoes was manured alike with forty cartloads of dung. The addition of

Nitrate of soda alone gave an increase above dung alone of .....	3½ tons.
Sulphate of soda alone gave no increase.	
While one-half of each gave .....	5½ tons.
Sulphate of ammonia alone gave .....	1½ tons.
Sulphate of soda, no increase.	
But one-half of each gave .....	6½ tons.
Nitrate of soda alone gave an increase of .....	3½ tons.
Sulphate of magnesia alone gave .....	1 ton.
And one-half of each gave .....	3½ tons.

The suggestion to our minds is this: probably a due supply of saline manures to obtain the natural solid constituents of the Potato, and storing the tubers before the late summer rains increase its watery constituent, may prevent the disease.—*Eda.*]

### ROSE CUTTINGS.

SEEING a few words on growing Rose cuttings on page 89 of the Journal, I think the following may be useful, having been very successful in striking them.

At the beginning of August plant the cuttings in large pots sunk in a shaded border, water well, and cover the pot with a propagating glass. In the middle of October move the pots to a south border, sink them, and earth-up round the glasses, so that no air is admitted, and in frosty weather have a mat thrown over the glasses at night. In this way I have grown

the most delicate Teas, as well as other Roses, with scarcely one failure, and planted out in April strong plants in the open border. They have blossomed well the first year.—A SUSSEX LADY.

### AUTUMN-SOWN ANNUALS—CALLIOPSIS.

MOST of the hardy annuals which are adaptable for autumn sowing are of procumbent growth, and are mainly suitable for early spring-flowering, but the Calliopes are of erect growth, and are not in full beauty until the middle of the summer. They are amongst the brightest of garden flowers, and are exceedingly rich if cultivated in masses, when they are, especially for distant effect, very striking. At the back of herbaceous or mixed borders, or for relieving the sombre aspect of the shrubbery, few, if any, annual plants can compare with these. Neither are they transient, for they continue in beauty almost throughout the summer. They are of the easiest growth, and are not affected by extremes of wet or dry weather to the same extent as are most flowering plants; and, further than this, they will flourish not only in the country, but will also contribute their brightness to town gardens. Their colours—yellow, red, and crimson, separate or in combination—are very brilliant; while in foliage and habit they are, if not elegant, certainly agreeable.

Seed of these plants is generally sown in spring, but in that case the plants are late in coming into bloom. To have them early, continuous, and fine they must be raised from seed sown in autumn; but still sowing must not be deferred until September, which is the right time for Nemophilas, but not for Calliopes. The latter are of very slow growth in their early stages, and, to afford them time to attain a safe size to pass through the winter, seed should be sown at the present time, or not later than August 15th. By late-autumn sowing, and also by spring sowing, I failed with these glowing annuals; but by sowing at the same time and in the same manner as winter Onions I have never failed to have an abundance of plants for planting in March, which commence blooming in June and continue throughout the summer months. If thinned out early the winter's frost never injures them.

Those who covet a great display for a little outlay of money and trouble cannot do better than sow thinly in drills at the present time. The seed must be very slightly covered. The varieties, which are all showy, may be selected from any seedsmen's catalogue according to the heights of plants and the colours which are desired.—A TOWN GARDENER.

### REPORTS OF ROYAL HORTICULTURAL SOCIETY'S FLORAL COMMITTEES.

THE size of the Exhibition on July 21st, and the limited time afforded to report it, rendered it impossible that everything could be noticed. Further, many plants were removed from the Council-room shortly after two o'clock, and others had no exhibitors' names attached, and at that time no one was in attendance to supply information. On August 4th a fine example of *Hymenocallis* candida was credited to Mr. Bull owing to its being near, and apparently belonging to, his collection. The exhibitor's name, Mr. G. F. Wilson, was not attached. The system of numbering will inevitably at times lead to misreporting. Mr. Douglas has stated on page 90 that the system of "attaching numbers instead of names to the plants exhibited can answer no good purpose whatever."—*REPORTER.*

### POROUS GARDEN POTS.

SINCE my former communication was penned I learn from Mr. Thomson of Drumlanrig that he considers his general collection of stove plants, which are potted in glazed pots, to thrive even better than they did in the common earthenware pots, and that he has commenced putting his Orchids in glazed pots also. I would also thank "EX-EXHIBITOR" for his last letter; but I must respectfully decline to accept his simple "I know they [glazed pots] are not safe," as a satisfactory assurance in the face of my own experience and the well-established facts I have already given. His surmises, too, as to what Mr. Dunn or anyone else might do under possible circumstances are surely irrelevant in a question of facts and experiment.

I wish to avoid carrying the discussion into the region of possibilities and mere assumptions. As far as we go let us tread on stable ground. Further, I must disclaim the compliment that the health of our bedding plants, &c., in the

dirty pots is due to extra attention or management, for such is not the case. "OBSERVER" concisely sums-up the advantages of glazed pots, and I must agree with him that there is no valid reason for imagining that a plant requires a porous pot. I accept with readiness the Editors' guarantee of good faith on "EX-EXHIBITOR's" part, and have no hesitation in believing that he states his own convictions, but they are unsupported by reasonable evidence.

It is hardly likely that glazed pots at present prices will supersede the old earthenware; that, however, is not the question, which is—Will a plant thrive as well in a non-porous pot as a porous one? As yet, practical trial answers in the affirmative, and we have not the least reason for supposing that success in any instance is due to an extra effort of skill on the part of those who have tried the experiment.

"EX-EXHIBITOR" is "sorry to see" I have so little respect for "general practice." I believe I share the general feeling of most practical gardeners of estimating every practice by its utility, and not by either its general adoption or its continuance.—J. SIMPSON, *Wortley.*

### ROYAL HORTICULTURAL SOCIETY.

A SPECIAL General Meeting of the Royal Horticultural Society will be held in the Council Room, South Kensington, on Friday, August 13th, 1875, at 8 o'clock P.M., to receive from the Council a statement of the result of their negotiations with Her Majesty's Commissioners, and to consider if they shall approve and sanction the agreements provisionally entered into between the Corporations.

#### HEADS OF PROPOSED NEW AGREEMENT BETWEEN THE COMMISSIONERS FOR THE EXHIBITION OF 1881 AND THE ROYAL HORTICULTURAL SOCIETY.

1. The subsisting agreements to be continued in full force where they are not inconsistent with this agreement.
2. The Commissioners to have the power of determining clauses 6 and 7 of this agreement at the expiration of the third year from its commencement if the income of the Society for that year, from entrance fees and the subscriptions of Fellows and other annual subscribers, shall not amount to £20,000, and the Commissioners shall in that case take upon themselves the repayment of the sum of £7000 hereinafter mentioned, or so much thereof as shall remain unpaid, and the interest thereof.
3. In the event of the Commissioners exercising the power by clause 2 hereof agreed to be given to them, they shall, notwithstanding anything herein contained, be entitled to any right of re-entry which they may, prior to exercising the said power, acquire by virtue of the subsisting agreements, unless the Society shall in the year 1876, out of monies which under those agreements would be applicable to the payment of the rent thereby reserved, and on or before the day on which such rent ought to be paid, pay in respect of interest on, and in reduction of the principal of, the said sum of £7000, the full sum of £2400, which but for this agreement ought to be applied in the payment of such rent; in which case such conditional right of re-entry as is given to the said Commissioners by the subsisting agreements shall be deemed not to have arisen.
4. Save in so far as their claim thereto may be necessary to preserve such right of re-entry as is referred to in the last clause, the Commissioners shall remit to the Society the sum of £2400, which under the subsisting agreements would be payable as rent in 1876.
5. The Society may borrow such sum, not exceeding £7000, as shall be necessary for the discharge of its existing liabilities other than its debenture debt, and for the thorough repair of its buildings at South Kensington.
6. The Society shall not accept any more life compositions without the written consent of the Commissioners.
7. Until the present debenture debt of the Society shall be fully paid off, all sums of money which under the subsisting agreements would be payable to the Commissioners as rent, shall be applied (a) in payment of the interest to accrue upon such sum as may be borrowed by the Society under clause 5 hereof, and in repayment of the principal monies so borrowed until they be fully repaid; (b) for the mutual benefit of the Commissioners and the Society in such way as shall from time to time be determined by the Expenses Committee and be approved of by the Commissioners.
8. Whilst the said clauses 6 and 7 remain in force, the Society shall, on the authorised bank holidays or on such other days not exceeding five in number in any one year as may be

agreed upon by the Society and the Commissioners, admit the public to the South Kensington Gardens free, or at such charge as may be fixed by the Commissioners.

### CATERPILLARS INFESTING GOOSEBERRY BUSHES.

UNFORTUNATELY some perplexity arises from so many persons well acquainted with horticulture, yet ignorant of entomology, confounding the true caterpillar of the Gooseberry moth with the false caterpillar of the Gooseberry Saw-fly. The lime remedy might sometimes be very effective in the case of the former, but is of small service, I think, with the latter species. Then, again, the Gooseberry moth is so conspicuous in its mature state that there is little difficulty in hunting them up in an ordinary garden; the pupa also are very recognisable on the leaves and twigs, and as the larva hibernates many may be destroyed in the winter months. There is really no excuse to be made for the gardener who suffers his bushes to be laid waste by this caterpillar; but the false caterpillar, or Gooseberry grub, producing the fly is not so easily mastered. I fail to see in any plausible theory the value of weeds in approximation to the bushes, though not questioning the apparent facts of the case given by "BETA."—J. R. S. C.

### VERONICA CANDIDA.

REALLY good "edging" plants are not by any means plentiful, more especially hardy ones. This *Veronica* must be included in the most select list of such plants. It is perfectly hardy, and besides having very pretty grey foliage, and being very effective when not in bloom, it is, when in bloom and yielding its dense pyramidal spikes of bluish-purple flowers, which contrast so strikingly with its very light-grey foliage, a very beautiful plant. It is a pity not to let it display its effective blooms; but if wanted for a grey edging only, it is best not to let it bloom. But anyone who has a dense long line of it in bloom once, will be very loth to denude it of its bloom for the sake of its foliage alone. It grows about a foot high, including the bloom-spikes, is rapidly increased by division, requires to be lifted and replanted every third or fourth year, and thrives in any ordinary garden soil.—D. T.—(*The Gardener*.)

### MR. JOHN STANDISH.

PERMIT one who knew our friend for many years to drop a pebble on the cairn to his memory, and to add a few remarks to those very true ones which appeared on page 97. I do this the more because it was through his introduction to those awful personages who rule in Fleet Street that I became a writer in the *Journal*, and to whom I owe some of the pleasantest hours and the heartiest friends that I have enjoyed or possess. I had many opportunities of judging of his character, and I am sure I echo the opinion of all who knew him when I say that a more hospitable and kindhearted man it was impossible to meet.

As a horticulturist, however, we have most to do with him. In one way he was a successful one, but I fear pecuniarily not so. He was a most thorough hybridist, and I can recollect how heartily (besides the flowers you have already named) he entered into the improvement of the *Gladiolus*; but although he raised some fine flowers, yet he was outstripped by Souchet who had the start of him, and later on by Kelway. But he still clung to it; and when Mr. Bull introduced *Gladiolus cruentus* from Natal he thought he saw an opening for bringing in fresh blood, and he set to work with his accustomed energy. We differed as to the probable results, for I maintained, that if it were crossed with those already in cultivation, the fact of its only producing two or three blooms at a time would militate against what we were all anxious to obtain—a long spike of bloom opening at the same time. He thought differently, but as yet no results have been obtained. He had latterly gone into the hybridising of Peas, and had anticipated great results, alas! if achieved to be seen by others and not by himself. He was an enthusiast in his calling, as everyone must be more or less who wishes to succeed; but I never met a more thorough enthusiast than Mr. Standish. Everything must succeed, he thought, which he took up. He saw no difficulties, and with his wonderful energy he oftentimes managed to overcome them. It was a strong proof of his energy that at his years he should have entered upon so arduous an undertaking as that of the Ascot Nursery, reclaiming a wild barren

heath, more especially as he had no family for whose interests he had need to work. What he has done there is known to many; and although I have not seen it for years, yet he has so frequently sent up its productions to London that most people know of it.

I think that one of the happiest moments of his life, in a horticultural point of view, was when he was enabled to exhibit at South Kensington the first instalment of Mr. Fortune's spoils in his second visit to China and Japan. Much elated, too, was he when he first exhibited *Lilium auratum*, and visions of grand results of hybridisation floated before his eyes, but as yet nothing notable has been done with it. He leaves behind him many friends who valued him for many excellent qualities, and both at home and abroad he will be greatly missed. His *bonhomie* made him a great favourite with the French nurserymen; and in a trip which I once made with him as far as Angers I was struck with the hearty manner in which he was received, and also with the fact that at fifty he had set himself so diligently to learn the language that he could make himself understood wherever he went. Rose-growers owe to him the introduction of Eugène Appert, a Rose still grown for its brilliancy, and Céline Forester; while his own achievements as a hybridiser have left their mark on many a flower. He would have heartily rejoiced at the altered aspects of the Royal Horticultural Society, but it was not for him to see, and those of us who are left may well learn a lesson from his energy, intelligence, and kindness.—D., Deal.

### NOTES AND GLEANINGS.

At a meeting of the Committee of the HORTICULTURAL CLUB held at the Club House, Adelphi Terrace, on Wednesday the 4th inst., George Deal, Esq., was unanimously elected a member of the Committee in lieu of the late Mr. Standish, and the following gentlemen were admitted members by ballot:—The Rev. E. Norman, Edgware; C. R. Stewart, Esq., Glasgow; H. C. Wilkins, Esq., Chipping Norton; W. B. Lewis, Esq., Weybridge; the Rev. C. C. Ellison, Bracebridge Vicarage, Lincoln; Capt. Christy, Buckhurst Lodge, Westerham; and H. P. Oakes, Esq., Newton Park, Bury St. Edmunds.

DURING the month of July seventy-two hampers or parcels of flowers were received by the PADDINGTON FLOWER MISSION. The distribution has been:—2315 bunches of flowers to St. Mary's Hospital, Lock, Great Northern, London Temperance, Samaritan Free, Hip Disease, and Gough Home for Children Hospitals; the Workhouse Infirmary, Annuitants, Victoria, Helvetia, Warrington, Mrs. Russell Gurney's, Dudley Stuart, Ladies', Aged Poor, Crippled Girls', Penitents', Deaconesses', and Gentlewomen's Homes; Hyde Park, St. Matthew's, Miss Boyd's, and Miss Cole's Orphanages; St. Mary's Kitchen, Cripples' Nursery; to firemen, policemen, and postmen, and many sick and infirm at their own homes; Servants' Training School, Ragged School, St. Giles's Workhouse, East Street Mission, and Christian Union Almshouses. The offices are at 3, Beinster Street, Cleveland Square, W.

THE PRE-HISTORIC LAKE-VILLAGERS undoubtedly raised Barley, Wheat, and Millet, several kinds of each of these cereals having been found in the lacustrine deposits. Some of these species of grain were cultivated in Egypt, and therefore are believed to have found their way from that country to Switzerland. Rye was not known to the colonists, and Oats not before bronze had come into use. Barley and Wheat appear either in grains, sometimes in considerable quantities, or, more rarely still, retain the shape of ears; and even carbonised Wheat bread, in which the bran and the imperfectly crushed grains can be distinctly seen, has been found at Robenhansen and Wengen. This unleavened pre-historic bread, which is very coarse and compact, occurs mostly in fragments, but sometimes in the form of small roundish cakes about 1 or 1½ inch thick, and was doubtless baked by placing the dough on hot stones and covering it over with glowing ashes. Millet was employed in a similar manner for making bread. It is probable, however, that the lake people consumed their farinaceous food chiefly in the shape of porridge. Carbonised Apples of small size, identical with those growing wild in the woods of Switzerland, have been found abundantly, and in a tolerable state of preservation. Mr. Messikommer discovered on one occasion more than three hundred of them lying close together. They are often cut in halves, more rarely in three or four parts, and were evidently dried for consumption during winter. Whether a larger kind of Apple found at Robenhansen

was cultivated or a wild-growing species remains undecided. Professor Oswald Heer of Zurich, who has published an interesting work on lacustrine vegetable remains, inclines to the former view. Wild Pears were treated in the same manner, but they are far less common than Apples, which must have formed a much-sought article of diet. Among other vegetable remains accumulated in the lake mud may be mentioned Hazel-nuts and Beech-nuts, both in great plenty; also Water Chestnuts, which doubtless were collected and eaten by the lake-men, as they are in Upper Italy at this day. Their present occurrence in Switzerland appears to be restricted to a tarn in the Canton of Lucerne. There have further been found abundantly the stones of Sloes, Bird Cherries, and wild Plums, and seeds of the Raspberry, Blackberry, and Strawberry, showing that these fruits of the forest were used as food. According to Dr. Keller the lake colonists of the Stone Age drew their sustenance chiefly from the vegetable kingdom. Their animal-food evidently was acquired by hunting rather than by the breeding of cattle, considering that in the accumulations around the piles the bones of wild animals outnumber those of the domestic species. Milk, we may assume, formed an important article of their diet.—(*Harper's Magazine*.)

#### AUCTION SALES OF IMPORTED PINE APPLES.

[We are indebted to that very useful Journal "The National Food and Fuel Reformer" for the following notes and illustration of one of Messrs. Keeling & Hunt's sales of West Indian Pine Apples.]

THE sale coming off is the last of the season, the number of Pine Apples to be disposed of by private contract or by auction being not less than 10,000. Mounting a ladder we enter a first-floor apartment, opening out in front to Monument Yard. We tread over a mass of leafy foliage, a number of men being busy in stripping the fruits. Others are engaged in assorting them according to size and quality, and placing the Apples in heaps on racks—"lotting them," as the phrase is. The display, from the nature of the fruit and mode of arrangement, is very effective, and is apt to remind one of a prize show. In the centre and along the sides of the room the fruit rises in pyramidal slopes, the separate heaps, relatively to the mass displayed, answering to the natural excreescences of the rind. The air is heavy with the aroma exhaled from leaves and fruit, and partially developed in the sea passage, for, however airily stored in vessels constructed for the purpose, a certain degree of fermentation, acting artificially as a ripening process, takes place in the holds; and, indeed, were the fruit not plucked before reaching maturity it would never see these shores. As it is, every season—the season for Pine-Apple arrivals extending from the middle of May to the end of July—thousands upon thousands are never landed, having experienced premature decay *en route*, and so are passed from the decks of the fruit schooners on to barges and pitched into the Thames. With an eye to effect, huge bunches of unstripped Pine Apples with fibrous ligaments appended are hung in rows round the roof of the show room, and here and there are set in pots, to appear at some of the splendid banquets of the City guilds.

We now learn something of the extent of the trade. The cargoes of Pine Apples imported last year were fourteen, and the number of Pine Apples 800,000, of the value of £14,000. Last season the losses in Pines that had to be pitched overboard amounted to 40,000. Eleuthera, Cat, Nassau, and Providence Islands in the Bahama group are the chief sources of supply. New Providence has in its eastern districts the largest field of Pine Apples probably in the world. From one spot can be seen at a single glance a million and a quarter of Pine Apples growing. The schooners are some 120 tons each, specially built or selected for the purpose, and are amongst the swiftest sailers, their average run being from twenty-four to thirty days. The extent of the trade acting as an encouragement to growers and shippers, the fruit is brought to this country in as perfect a state as possible. Being fitted up in a superior manner, the beauty and condition of the fruit is well preserved. No time is lost on their arrival in landing, assorting, and disposing of the cargoes. As soon as a Pine-Apple-laden schooner is telegraphed in London preparations are made for sale. All whom the sale concerns—and these embrace, together with wholesale dealers and retail shopmen, the noble army of costermongers, the latter each year taking a more and more important position as buyers—keep themselves well posted as to cargoes reported and landed. The earliest time

when West Indian Pine Apples were imported on any scale into this country was in 1844, and thus the London trade is of comparatively modern origin. Previously the United States merchants held in their hands the monopoly of supply. The competition that thus sprung up, and the enlarged market offered, induced speculators to improve the cultivation. The earlier Pine Apples were very inferior to those now offered, and would set one's teeth on edge. The West India colonists, thus stimulated, not only produce a superior fruit but in greater abundance. Steamers were tried some years since, speed being in their favour; but the heating of the holds occasioned by the steam, and a certain odour from the engine oil easily affecting the fruit and deteriorating its qualities, caused them to be abandoned. On being landed here it is a necessity to lose no time in stripping them. It is as well our readers should know that even the crowns, if suffered to remain, live on the fruit till they have sucked out all its goodness.

We see an announcement of the sale, by Keeling & Hunt of Monument Yard, of 10,000 Pine Apples, and are on hand as the hour approaches and mix with the throng. The time of opening is somewhat delayed, possibly owing to private negotiations. The Pine Apples, the appearance of which we have described, being the last sale of the season, the occasion has brought out some of the principal dealers. Covent Garden is in full force; there are here shop fruiterers from north, east, and west, and from the Borough, and others up from the country. The costermongers have evidently a strong contingent—not that every peripatetic Pine-Apple crier is here, for much of this sale's business is done through representative men, a number clubbing together in the first instance, and buying at auction rates, with a slight commission. Costermongers though they be, none of rough element develops itself, except, perhaps, in sundry jokes, for street parlance has nothing about it of Addisonian elegance or Chesterfield propriety. The great effort of each one having secured a catalogue is, if possible, to get another.

At last, amidst much buzzing and some apparent confusion, the sale commences; not, however, till some apparent sensation has been excited by the entrance of the "Prince of Buyers," the leading Covent Garden salesman in the trade, who is regarded by the mass with an awful reverence, something like that which in the financial line would be accorded to a Rothschild. He takes a central place, with a quiet self-possession accordant with his position. The next movement is on the entrance of a "promoted costermonger," an individual who has advanced himself from a wheelbarrow to a shop, and who as the purveyor of a score of second-class hotels, and with a wide business connection with his former brethren, is destined to be a formidable competitor. Other notable individuals drop in, as rapidly and methodically, the lots are put up and knocked down. The first lots being the best, the bidding for these was with the leading men; presently the chorus of voices swells, till the whole crowd becomes animated and anxious, the rougher sort interspersing their bids with humorous sallies at their opponents, and now and then following this up by pitching at each other crowns of Pine Apples. The auctioneer does not attempt to praise the stock; each man is an expert, but a keen watch is kept on relative proportions secured, especially by leading buyers. To look at the everyday appearance of the buyers a stranger would scarcely imagine that there are men here who could buy shiploads. Presently the bidding grows fast and furious; the good nature that has hitherto prevailed is no longer in the ascendant; the keenness of competition asserts itself, and red faces, contorted visages, and angry looks attest the agitation that prevails.

It requires an expert and practised ear to follow the progress of business as bass and treble notes blend tumultuously, now suddenly settling down, and then renewed, on a new lot being offered, with redoubled energy. Such is the interest exerted by the sale—such, shall we say, market necessities, that the room has long since become crowded. Bids grow to vociferations, especially with the choice lots, and by the time the sale is ended enough physical energy appears to have been expended to make a hue and cry for all the foxes in the kingdom. Some of the buyers have evidently gone in for quality, and buy none but the best; others go in for quantity, doing no business unless they can buy cheaply. The prices brought were fair, and it was really remarkable how cheaply some of the lots went off; but then the fruit trade, and especially the costermonger trade in Pine Apples, is an extremely risky one. With these the ability to sell quickly—and Pine Apples will not last—depends on the weather; and with a Pine Apple once

cut open its aroma rapidly disappears, and dissolution follows. After all, the best Pine Apples in the world, as the best Grapes, come from our English hothouses, and may always be

had "at a price," as the saying is. As these are not for everyone, it is well we secure from 50 to 60 per cent. of the Bahama growth, for Americans are as fond of Pine Apples as ourselves.

Fig. 17.—Bahama Pineapple & HUNT'S HALL ROOM.

Pine Apples from the Island of St. Michael's (Azores) have been sent to London for the last six or seven years, increasing in quantity every season. They arrive (packed in crates containing one to three Pines) by the clipper steamers and schooners employed in the Orange trade during the months of November to April inclusive, are of very fine quality and size, weighing from 5 to 8 lbs. each. In flavour they equal the Pine Apples grown in England, and realise from 15s. to 30s.

per Pine. One sold some seven years ago realised as high as 106s.

#### THE LOWER GROUNDS, ASTON PARK, BIRMINGHAM.—No. 2.

BARROWLY returning to this noteworthy garden, it may be mentioned as an instance of the influence of the Royal Hor-

horticultural Society in giving an impetus to horticultural enterprise, that from the date of the visit of the Society to Birmingham in 1872, the Lower Grounds have become increasingly popular. Before then they were appreciated by the numerous visitors, but their fame was only local, and they were regarded as a rendezvous for recreative purposes more than as an exemplification of superior gardening. But the patronage of the great Society stirred up a zeal for horticulture, and Mr. Quilter, quick to perceive the public taste, and prompt to provide for the gratification of his patrons, determined that the establishment should not only be a garden in name but in fact.

The building which had been erected for the Royal Horticultural Society's Show was left standing. It was strengthened in every possible way, and half of it was covered with glass, the other half left to be covered with canvas to be ready for special purposes and occasions. The glass portion was

divided into two divisions, the one part to afford a promenade in bad weather, and the other to be decorated as a conservatory. This portion, which is 120 feet wide and nearly 800 feet in length, is now made gay with flowers at every period of the year, and besides contains permanent plants of considerable interest and value. Not in many private gardens can be seen such thoroughly healthy examples of *Dicksonias*, *Alsophyllas*, *Araucaria excelsas*, *Strelitzias*, *Aralias*, *Seafortthias*, *Yuccas*, *Agaves*, *Chamerops*, *Coryphas*, *Phormiums*, &c., to say nothing of *Camellias* and *Azaleas*, as are here planted out in this spacious conservatory. The vigour of these plants and their cleanliness betoken that both time and skill are expended on them, and this for the gratification, not of an occasional influx of horticultural visitors, but for the steady stream of the general public who have been taught to admire and become interested in the higher forms of vegetation. Horticulture has thus been brought home to the great mass of the people in

Fig. 18.—ASTON PARK—THE SUBTROPICAL GARDEN.

the best form and manner. To keep this edifice gay and to provide the means of protecting the thousands of plants which are employed in the embellishment of the grounds, other extensive ranges of glass structures are erected. These are admirably adapted for the purpose of miscellaneous plant-growing, and are occupied by collections of plants in the good order usually found in the best-managed private establishments.

But not only are choice collections of plants cultivated for indoor decoration, but the grounds also contain the best examples of flower-garden embellishment. In order to keep pace with the times not only must there be bedding, and ribboning, and carpet gardening, but there must be also a sub-tropical department. Now this, be it noted, is no mere apology for that advanced and deservedly popular mode of garden adornment, but is carried out fully and well. The site chosen is extensive and singularly appropriate, and is, indeed, an agreeable promenade on the banks of the lake, and is alike sheltered from the winds and shaded from the sun by the canopy of foliage of the overhanging trees. It is an agreeable retreat greatly patronised. It was easily formed by taking advantage of the natural features of the place, and turning them to account—features that are existent in many other places, and the idea here given is one that might with advantage be acted on by others who are seeking to beautify their home surroundings.

The plants employed in this section of the Grounds are not inferior to those found in the London parks, and comprise Palms, Ferns, Cannas, Abutilons, Ricinus, *Ferdinandias*, *Dracenas*, *Ficuses*, *Yuccas*, *Solanums*, *Grevilleas*, *Wigandias*, *Acacias*, *Aralias*, &c., which are prepared and arranged by Mr. Spinks in a manner which has won considerable approbation. Besides the sub-tropical there is also the flower garden proper, and which at the present time contains an exceedingly fine example of bedding-out, and which is worthy of inspection by all who are interested in choice and striking floral arrangements. This garden is novel in its way. It is a square of about two acres within lofty walls, and was once the old kitchen garden of Aston Hall. Along the centre of the garden are thrown-up embankments on either hand crosswise and lengthwise, and in the centre is a fountain and a circular embankment. These raised mounds are planted in geometrical patterns, and the effect is singularly striking and good. The quarters of the garden are turfed and formed into sunken panels, and a series of flower beds fringe the walks. It is impossible to give an idea of this remarkable enclosure, the plan of which was so well conceived, and the working of which is so thoroughly carried out. It is an original example of flower gardening, and is admired each season by thousands of visitors.

All who have the opportunity should visit these now historical grounds, and see what can be accomplished by a ready

will and well-applied skill, and to note how perseverance and enterprise in a horticultural pursuit have won success.—W.

## NOTES ON VILLA AND SUBURBAN GARDENING.

### KITCHEN GARDEN.

CONTINUE to earth-up all the forward Celery as time will permit, in order to have it well blanched for use at an early date. The later plantings may be allowed to grow much more before earthing, for as it is required for keeping, the stems become more hardened by long exposure to the air. Plant out a good lot of Endive of sorts on some of the best of the Potato ground. The same sort of ground will do for a bed of Prickly Spinach to be sown now. Onions should be sown shortly for handglasses, and in a short time another little lot sown, to be kept over the winter in frames or under other temporary protection. Cabbage plants for the spring bed must be raised at once and the ground be prepared for the plants. Lettuces may now be sown in quantity, to be planted out for autumn and winter use; good sorts are Lane's Bath Cos and Hardy Green Cabbage Lettuce. For this planting I like the soil to be firm at planting time, but it ought to be pretty good; merely pointing the surface soil up of sufficient depth to insert the plants will do. I of course allude to a soil that has always been well worked. Under such conditions the plants do not grow so large, but they become firmer in texture, and are therefore better able to bear the winds and wet of early winter.

Continue to plant out Savoy, Coleworts, and Asparagus Kale. The frequent showers we are having will start them well. Sow seed of Tripoli Onions for spring use. All the forward Potatoes have been taken up, and so far are nearly free from the disease. The late sorts have not escaped, but if they were ripe I would take them all out of the ground, or treat them the same as Mr. Durey does at Hothfield. He pulls the haulm out and earths the rows up sharp and high, leaving the tubers there for a long time. He says they keep better in this way than any other.

### FRUIT GARDEN.

The wood of wall fruit trees in general should be constantly kept nailed-in. Strong shoots of Peaches and Nectarines often throw out many laterals, which should be pinched out at the lowest bud, and all other wood not likely to be wanted may be cleared out with advantage to that remaining. Always be careful of the foliage. Place a net over all trees with fruit ripening; the hexagon netting is the best, as it admits plenty of light and air, as well as keeping away flies and wasps. Plant out young Strawberries at once from those which were layered in pots. Take care not to plant too deep. The crown of the plant should be left well up, so that it may receive all the sun and air possible. Those required for forcing must be potted-on in the same way, only the soil must be made firm in the pot, and afterwards the pots be stood upon a hard bottom, so that they cannot root through; they will then make good plants with well-formed crowns.

### FLOWER GARDEN.

Should the weather prove fine now the bedding plants will be in great beauty for some time to come; and as most of the Pelargonium class have grown considerably they will need a little regulating, and in some cases cutting back. These shoots so taken off may be struck, as it is now time to think a little about propagating for next season's supply; but before doing that it is advisable to first determine what alterations, if any, are needed in the arrangement and associations of colours, and marking any deficiency in the growth of any plant, so that a more perfect system may prevail another year. By this mode much inconvenience will be spared in keeping useless plants over the winter. Give a finish to all parts of the garden by attending to neatness and order. Edgings of beds should be smooth and trim, and walks clean and free from weeds, and a garden will yield additional enjoyment.—T. RACON.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### HARDY FRUIT GARDEN.

THE fruit room should now be thoroughly cleansed, if it has not been already done; the walls whitewashed, and the stages, floor, &c., thoroughly scrubbed with a stiff brush and hot soapy water; the doors and windows ought to be opened in fine weather afterwards to allow of it becoming thoroughly dry. The earliest Apples and Pears are now ripening, and are gathered as soon as the stalks part freely from the branches; the trees require looking over every day, as a very slight wind causes the fruit to fall off.

The Apple first to ripen is the White Joanneting; it is best gathered from the tree and used at once. Early Red Margaret is the next, followed by Red Astrachan, and but very little later the Irish Peach; the last-named is only a week or ten days later than the Red Margaret, but it is by far the best for flavour. Some of the fruit was ripe about the last day in July, and a large

basket was gathered on the 5th of August. At the same time as Irish Peach the Early Harvest was gathered. This is also a very excellent Apple. A tree of each of the above should be grown in the most select collections, except, perhaps, the Astrachan, for the tree is of very vigorous growth, which is not a point in its favour, except for orchards; its fruit is the most beautiful of all, but the beauty is only skin deep, the fruit being too acid for dessert purposes.

Doyenné d'Été Pear is nearly over, but an old tree of Jargonelle that ripens its fruit ten days before another that was planted ten years ago is now producing ripe fruit. The old tree has passed the meridian of its life, and does not make much growth. In taking a tabulated estimate of the time of ripening of different varieties the probable age of the trees ought always to be taken into account.

Old trees on walls have not required any attention as to nailing or stopping of growths. A tree in full bearing does not make much growth, for when the fruit has taken its second swelling all the vigour is required to ripen-off the fruit. Young trees continue to grow until stopped by autumnal frosts; the growths should be nailed into their places, also the autumn gales, which are not far distant, make sad havoc. Leading growths must have special care taken of them, as on the care exercised in training them correctly the symmetry of the tree depends. All robust growths should be stopped up to the present month; after the 1st of August no young growths should be stopped.

Many of the old-fashioned gardeners, and some of the more modern school, would not stop the growths, but permit them to run 6 feet or more, and then cut back in autumn or winter. A wall tree under proper summer pinching will cover a wall in less than half the time that it would take to do so by the old system of allowing all the leading growths to mature without stopping. Take, for instance, a Pear tree horizontally trained to a brick wall 12 feet high; it has a leading growth in the centre, and two side branches opposite to each other to start with. Now we want to place branches opposite to each other, and at 9 inches apart to the top of the wall. To do this the leader is cut at 9 inches from the first pair of branches; a number of eyes will start, but three growths only are saved, one to form a leader and the others for side branches. Now, if the leader is not stopped no more side branches will be formed that year; it may grow 6 feet or more, but no side branches will be formed. It is again cut down to 9 inches at the winter pruning, and the same process of training is repeated annually, and only one pair of branches is formed each year. Now, instead of letting the leader run away let it be pinched back, and three pairs of side branches may be formed instead of only one pair, so that by pinching the tree will do as much in one year as it would in three by the other method.

Apriots are now ripening, and some of the earliest Plums. It will be necessary to protect them by hexagon netting from birds, and the choice Apriots must be covered with gauze to preserve the fruit from flies. It is a good plan to mulch the borders with litter; this prevents evaporation and protects the fruit that falls from being bruised.

### VINERIES.

We do not have much warmth by day, and it has been so chilly at night that it is quite necessary to use artificial heat both in the Hamburgh and Muscat houses. A circulation of air is kept up by opening the front and back ventilators a little, and this circulation is further promoted by the heat in the pipes. Grapes colour best in well-ventilated houses, and a constant circulation is necessary. We fancy that black Grapes finish best in dull weather, sunshine in abundance being requisite for Muscats and all the white varieties. Trebbiano, White Nice, White Tokay, and others of this class seem to require more heat to ripen them than the Muscat of Alexandria, and, as a rule, when they are ripened the flavour is not superior to the Almería Grapes that are sold at a shilling a pound in the winter. In Essex Muscats can in most seasons be ripened very well without any artificial heat after the fruit is set. This year the sun heat has not been sufficient to ripen them.

It is now a good time to have the early vineries painted. If this is deferred until later the work cannot be done so satisfactorily; the lights ought to be taken off, so that the paint may reach all the crevices. In fine weather all the permanent work may be done; the lights to be placed in a dry place and reserved to the last in case the weather should be wet. Early vineries suffer more than later houses; much heat and moisture early in the year is very trying to the paint. They ought to have three coats of good paint outside and two inside every three years.

The pot Vines intended for early forcing have now nearly ripened their wood. Water more sparingly at the roots, maintain a drier atmosphere, and ventilate more freely. The buds are now being formed for the future crop.

### CUCUMBER HOUSE.

It seems almost needless to say anything about culture at this season, as any cottager with an ordinary box-light can easily supply his family with Cucumbers at this season, but we are

tempted to notice them because the variety Tender and True raised at Loxford has been exhibited badly at a time when Cucumbers can be grown without difficulty. When this is the case the first thing is to blame the seed. Now until this year the true stock has been grown at Loxford from cuttings, but the stock was lost last winter, and we were in the same position as any other gardener, and had to trust to seeds obtained from Messrs. Veitch of Chelsea, and the Cucumbers obtained from their seeds were not different from the original stock. It was truly said by a good judge "that there are no bad sorts of Cucumbers; the fault is always in the culture." The miserable specimens of Duke of Edinburgh exhibited at South Kensington for Mr. Monroe's prizes go a long way to justify this expression. Cucumber plants in houses require to be kept free from insect pests, and the house ought to be ventilated pretty freely all through the summer months.

#### GREENHOUSE AND CONSERVATORY.

If a good supply of flowers have to be kept-up during the winter and spring months, the plants intended to produce the supply must now be attended to. Of the most useful may be named *Cyclamens*. These continue to flower freely from Christmas until the end of March, and may now almost be said to be indispensable for cutting from. We are now repotting them, 8-inch pots are the largest used, and our largest plants have been in that size for two years, so that the corms are large. The ball is reduced to allow of some of the potting material being placed under it, and about an inch in width all round the sides. Younger and smaller plants that are now in 5-inch are repotted into 6-inch pots. It is not necessary to allow very much pot room for the Cyclamen, but the pots are well drained, and the drainage is protected by good fibry loam being placed over it. The plants grow and flower well in a compost of turfy loam three parts, one part leaf mould, and a liberal addition of sand if the loam is not naturally sandy. A little rotted stable manure may be added, but it is not necessary. The plants will not succeed if they are not placed near the glass and slightly shaded from scorching sun.

*Primula amana* and its varieties serve to keep the houses very gay in April, but the plants are frequently neglected after the flowering period; red spider, a desperate enemy of this plant, being allowed to feed unmolested on the leaves. The plants ought to be placed in a cool frame in a shady position, and the leaves must be kept green until growth is completed. They are also being repotted in similar compost to the Cyclamens, and the other treatment as to size of pots, &c., is not materially different. Cinerarias are another useful class of plants for winter and spring flowering. Plants raised from seed grow most freely, and if the seeds are sown in April very large plants may be produced by September; a succession may then be obtained from October until April. Specimen plants of *Chrysanthemums* that have been allowed to grow without much training until now are having the rambling growths brought down. Those plants intended for cut flowers have the upright leading shoots trained to sticks, and the side growths pinched back.

Fuchsias and Zonal Pelargoniums in endless variety now serve to keep the show houses gay.—J. DOUGLAS.

#### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

NATIONAL ORNAMENTAL AND POOTER SOCIETY.—August 18th and 14th, in Manchester Botanic Gardens. Rev. F. D. Horner, Kirby Malsard, Hon.-Sec.

BURNOPFIELD.—August 14th. Mr. J. Hood, Sec.

IDLE.—August 14th. Mr. H. N. Illingworth, Sec.

CARTWELL, NORTH LANCASHIRE.—August 14th. Mr. W. Cragg, Hon.-Sec.

COVENTRY (at Coombe Abbey).—August 17th. Mr. T. Wigston, 8, Portland Terrace, Sec.

DOVER.—August 18th.

NORTHLEACH.—August 18th. Mr. J. Walker, Hon.-Sec.

CHARD.—August 18th. Mr. T. L. Brown, Hon.-Sec.

MASTBOURNE—in the Devonshire Park.—August 19th. H. A. E. Rumble, Esq., 26, Hyde Gardens, Sec.

GLASTONBURY.—August 19th. Rev. E. Handley, Hon.-Sec.

PONTPOOL.—August 19th. Mr. Ernest Deacon, Hon.-Sec.

ULVERSTON.—August 20th. Mr. Geo. Higham, Hon.-Sec.

CONISTON.—August 24th. Mr. Jas. Dickinson, Hon.-Sec.

HARTLEPOOL.—August 24th. Mr. Connelldor H. Magoris, Hon.-Sec.

NEWBURY.—August 24th. Mr. H. Seymour, Hon.-Sec.

BURTON-ON-TRENT.—August 25th. Mr. W. Shave, Sec.

ISLE OF THANET (St. Peters).—August 25th.

#### TO CORRESPONDENTS.

\* \* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

HEAVIEST STRAWBERRY (S. W.).—We have no remembrance of the statement you mention. An experienced gardener informs us that he once knew two berries of the Oscar weighing 10 ozs., the largest of them weighing 5½ ozs.

TRAY OF POT-HERBS (J. Hirst).—Not knowing the exact terms in which the prize is offered, we can only say that Angelica, Borage, Chervil, Marjoram, Mint, Pennyroyal, Parslane, Sage, Savory, Tansy, Tarragon, and Thyme are pot-herbs, and that the prize probably will be given to the most numerous and best-grown collection of them.

EARLY RIVERS PRACH WITH SPLIT STONES (P. P.).—This variety is peculiarly liable to be affected in this way. We have fruited annually for the last five or six years in the orchard house, and seldom have less than half of the fruit with split stones. This year only two or three fruits were sound and the tree had a good crop. We do not know any remedy. The cold wet season is probably the cause of it being so bad this year.

PRACH LEAVES GLAZED (G. S.).—We believe that the syringing is the cause. You say the trees are not syringed after being removed to another house, but they must surely have been syringed previous to this, else how are the leaves free from spider? If "the roof is frequently syringed with whitewash," this would be washed into the tank, if you have any; or if you use hard water, the sediment might be in that. If this is not the case we cannot account for it on the data you have given us.

PRACH FAILING (A. A.).—The stems and leaves become yellow because the roots cease from supplying them with sap. If the surface soil over the roots was mulched, and water given copiously in dry weather twice weekly, there would be no such failure.

BRICKLAYERS' RUBBISH (Jones).—The limy portion of it is a useful manure, but the brickbats are useless except to fill underground drains or to add to the subsoil of Vine borders.

GRAPES DECAYED (Mrs. G.).—The Grapes sent are in a deplorable state. If they are a fair sample of the crop we can only say that it is valueless. Grapes so extensively diseased are incurable. Cut out all the worst bunches and relieve the Vines of their burden by way of preparing them to bear better fruit next year. The fruit appears to be affected by shanking, rusting, scalding, and we suspect also the attacks of thrips. If they are infected by insects (of which we cannot absolutely determine without seeing the foliage) smoke the house and syringe thoroughly—almost violently. Remove also the surface soil from the border, and replace with 5 or 6 inches of rich manure to afford nourishment to the roots. Admit air freely yet judiciously—that is, do not close the house entirely at night, and increase the ventilation very early in the morning. If the growth is thick and overcrowded remove a portion, so that all the principal leaves can have the benefit of light. By this practice the Vines may be restored. Free root-action, pure air, light, a genial temperature, and freedom from insects, must all be provided to insure healthy Vines and satisfactory Grapes.

NECTARINES AND APRICOTS FOR MID-YORKSHIRE (S.).—Of Nectarines you mention—Balgowan, a Scotch-raised variety; Hardwick, very hardy; and Elruge. Of the Apricots the Large Red.

GRAPES PARTIALLY SHANKED (A. B.).—The roots do not supply sufficient sap to sustain so heavy a crop. Water copiously with tepid very weak manure water. We advise you further to remove entirely the bunches which are the most affected, even to the extent of one-half of the crop, not only for the sake of those remaining, but in the interests of the Vines, which are greatly overcropped.

INSECT PREVENTIVE (E. M. M.).—Two ounces of soft soap dissolved in a gallon of water, and this mixed with another gallon which has been poured when in a boiling state on 2 ozs. of strong tobacco, will provide the liquid you require. If it is warm, say at a temperature of 100°, when used, no sediment will be left on the foliage. You cannot do better than follow the advice which you quote, and you will not be troubled with insects.

CUCUMBERS NOT SWELLING (X. Y. Z.).—The atmosphere of the house is too cold and moist. Give them more air, to do which you will probably have to afford more heat, and especially bottom heat, keeping that steady at sun from 75° to 80°; the top heat 65° to 70° at night, 70° to 75° by day without sun, and 85° or 90° with sun and a full amount of air. Leave a little air on at night and in dull weather, and shut-up early in the afternoon, damping the house two or three times a day, and especially at closing time, so as to maintain a congenial atmosphere. The bed should be kept well watered, but avoid making the soil sodden.

LORD GROSVENOR APPLE (E. N., Hamburgh).—It is known in England by the name of "Jolly Beggar" also. The following is the description of it in Dr. Hogg's "Fruit Manual":—"Fruit, about medium size, 3½ inches wide, and 3 inches high; roundish. Skin, pale yellow, with an orange tint next the sun. Eye, large and open, set in a plated basin. Stalk, half an inch long, rather deeply inserted. Flesh, white, tender, juicy, sweet, bristly and pleasantly flavoured. A first-rate early cooking Apple from August till October. The great merit of this variety is its great fertility, the small bush trees producing an abundance of fine yellow fruit. The tree bears very early, and is one of the most useful for garden culture."

HARDY AND HALF-HARDY PLANTS FOR BEDDING (L. MacG.).—As you wish for foliage more than flowers, our list is framed accordingly—*Alyssum* (Konign) variegata, \**Antennaria tomentosa*, for edging; \**Arabis alpina* variegata aurea, \**A. mollis* variegata, *Centaurea candelabrum*, *C. rugulosa* compacta, \**Cerastium tomentosum*, \**Cineraria maritima*, *Coprosma Buergeriana*, \**Dracopis glomerata elegantissima*, \**Eucynonum radicans* variegata, *Frederick Landeri*, *I. Herbati*, *Meibomiaanthum cordifolium* variegatum, *Polemonium oerulesum* variegatum, \**Pyrethrum Golden Feather*, \**Sempervivum californicum*, *Senecio argenteus*, *Stellaria graminea* aurea, \**Thymus citricolor* aureus, \**T. citricolor* marginatus, \**Thymus Golden Fleecy*, \**Viviana elegantissima*, and *Dell's Crimson Beet*, and *Perilla nankinensis*, which may be raised from seed. Those distinguished by an asterisk are hardy. *Pelargoniums* Annie Keeler, Miss Batters, and Prince Arthur. Those have golden leaves with bright zones. Silver-variegated are Bijou, Bright Star, and Queen of Queens, Prince Silverwings being effective; and in the Golden-leaved we shall only name Crystal Palace Gem.

**PLANTS FOR GREENHOUSE (P. F. S.).**—We should provide a dozen at least of *Thou*, and half a dozen of *Spotted* and *Fancy Pelargoniums*, a like number of *Tricolor*, *double-flowered*, and *Zonal Pelargoniums*, a dozen *Fuchsias*, *Cyclamen persicum* var., *Primula sinensis*, *Cinnsia*, *Calceolarias*, and *tree Ornations*. These are all of easy culture, and after you have provided yourself with them you will probably have little space left; or you may so limit the number of those named as to leave space for others, a few of which are—*Azalea armata*, *Chorizanthe cordata splendens*, *Conna Brilliante*, *Cypripedium pubescens*, *Dracophyllum gracile*, *Epistola floribunda*, *Gesneria tulipifera*, *Hydrangea hortensis*, *H. stellata* *flor-plena*, *Kalanchoe crotolaria*, *superba*, *Liliodora floribunda*, *Nerium rubrum* *plenum*, *Pimelea decussata*, *P. spectabilis* *rosea*, *Polysiphia Dalmatiana*, *Rhododendron jasmiflorum*, *Statice profusa*, and *Valloia purpurea*. *Andreas*, *Orterion*, *Duchesse Adelaide de Nassau*, *Narcissus*, *Madame Van Houtte*, *Ferdinand Kauljan*, and *Stella*. *Camellias*—*Alba-plena*, *Fimbriata*, *Valtaredo*, *Raffa*, *Methuana*, and *Mrs. Cope*. *Briosa castra*, *E. gracilis*, *E. hyemalis*, *E. melanthera*, *E. hybrida*, and *E. ventricosa Bothwelliana*. *Eparis* *colipae*, *E. The Bride*, and *E. hyacinthiflora*. From the above you may select, as we have probably named too many.

**PELAGONUM CUTTINGS (Idem).**—Three parts light turfy loam, and one part each of leaf soil and silver sand. Insert the cuttings around the sides of pots well drained, placing them in a cold frame and keeping close, but avoiding damp. Our "Garden Manual" would suit you. It may be had by post from our office for 1s. 8d. Dixon's "Treatise on Tricolor Pelargoniums" will meet your requirements respecting these plants.

**LAWN UNLEVEL (H. A. P.).**—The only plan will be to remove the turf in the autumn, and fill up the holes and make the surface even, and then relay the turf. The soil used for filling-up the hollows should be made firm, treading well before laying the turf, for if only loosely filled the soil will settle, and irregularity of the surface will again follow.

**NAMES OF FERNS (Idem).**—1, *Pteris serrulata*; 2, *P. serrulata cristata*; 3, *Adiantum formosum*; 4, *Asplenium bulbiferum*; 5, *Polystichum angulare proliferum*; the flower is a *Kalanchoe*, probably *coccinea*. All the specimens are poor, and not in character sufficient for correct identification.

**PEA (W. A.).**—We cannot name a PEA from the pods. The varieties are too numerous, and many too nearly alike.

**PELAGONUMS AND CINERARIAS (E. M.).**—The Pelargoniums you may keep in your greenhouse providing they have an abundance of light and air. If this cannot be afforded stand them in the open air in the full sun. The Cinerarias will be better in a cool shaded place out of doors than in the greenhouse for the next six weeks. They must not be under trees or they will not have the benefit of night dew, which is very refreshing to these plants.

**PROPAGATING CLEMATIS (An Amateur).**—Layers made in September, or cuttings now of firm short-jointed side shoots taken off close and inserted in light sandy soil under a handlight in a shady place, or shade from bright sun. The layers should be of the ripe wood of the current year—short-jointed wood, and have a tongue or notch below the joint lagged in the soil.

**PERPETUATING HERBACEOUS CALCEOLARIAS (J. H.).**—The proposed keeping of the plants that have bloomed, for next year's display, is not new, but is now discarded from the fact that seedlings are much more beautiful, blooming stronger and better in every way than the old plants, or plants from cuttings taken from them. We advise you to throw them away, and raise plants from seed for next season's showing.

**CONSTRUCTING HARDY FRERNERY (Old Subscriber).**—There is no objection to the Oak trees providing the situation be sheltered from cutting winds, for a bleak exposed position is not good for Ferns. The essentials of a hardy fernery are shelter, as that of a hollow, rock, or raised ground, shade from scorching sun, and constant but not stagnant moisture, for Ferns are not bog plants, the water being required to percolate freely. If you do not propose to have rockwork, we should at least form a bank or earthwork, which will answer for the stronger-growing, but not for the smaller kinds of Ferns, which require rockwork, for the which you may possibly find some boulders, and these cropping out here and there will add immensely to the appearance, the form being given by any kind of rough material, as clinkers, stones, rubble, &c. You should provide drainage sufficient, and 9 inches to a foot thickness of soil, but where you have rock it will suffice to have a less thickness of soil; or if the boulders be large you will not require soil before placing them, but merely fill the interstices, and place in any openings or upon ledges that may be formed by the rock. Two parts fibrous brown and sandy peat, with one-third yellow fibrous loam, will grow hardy Ferns well except a few kinds, which require limestone.

**SEEDS FROM SIAM (—).**—From the description you had with the seeds the plant is probably *Holmbooldia scandens*, a climber with scarlet flowers. We should sow the seeds at once in pots, covering them with soil about half an inch deep, and place in a brick bottom heat, as that of a hotbed; or they may germinate in a warm part of a stove. They should be kept moist, and when the seedlings show the second leaves transfer to single small pots, returning to the hotbed, and keep rather close and shaded until established, and then transfer to the stove. We should advise you to only sow a portion of the seed at this time of the year, retaining a part for spring sowing, as the plants are more likely to fall sown now from damp, &c., than were they sown in spring. Equal parts of sandy peat and light fibrous loam, with a sixth part of silver sand and good drainage, is a compost to grow the plants well.

**VITIS ODORATISSIMA CULTURE (S. E.).**—Train the shoots about 18 inches distance apart—that is, the permanent shoots, and the laterals from them stop at one joint. These shoots or canes will push numerous shoots next year, which should be rubbed off, so as to leave them a foot apart on opposite sides of the cane, or rod as it is after a year old, and have the shoots neatly trained to the wall. Stop each shoot at the sixth leaf if no flower appear when that length of growth is made; but there will be at that or thereabouts if the wood be ripe. Keep the laterals moderately stopped, for upon them, as well as upon the first shoots, will appear clusters of fragrance; reducing them in autumn, so as to admit air and light for the ripening of the wood of the principal shoots, which should be cut back to two eyes after the leaves have fallen.

**DUCHESSE DE CAYLUS ROSE (Idem).**—Place it outdoors in an open situation, and keep well supplied with water, potting at the close of September; and in October place in a cold frame, with the pot plunged in ashes, and in January prune and place in a light airy position in the greenhouse.

**BARREAN ROSES NOT FLOWERING (X. Y. Z.).**—Train the shoots rather thinly, so that they may be full, exposed to light and air, and the wood thereby thoroughly ripened. The situation or aspect should be a warm one—

south or south-west. Prune but little, merely cutting out any worn-out shoots and the unripe points of the shoots of last year's growth, the pruning being deferred until spring.

**WINTERING ALTERNANTHERAS (Idem).**—Take up before frost, pot singly, and place in a house having a temperature of 56° to 58° from the base, watering so as to keep fresh, but on the other hand avoid too much moisture at first, or the plants will damp. They are best upon a cool bottom, and after the turn of the year encourage with more moisture and heat, so as to foster growth for cuttings. The Lobellias should be potted in the same way, and be kept in a light airy position in a house from which frost is excluded.

**LILLUM AURATUM FLOWERING OUTDOORS (E. T.).**—It is not unusual, or only so because this beautiful kind is not more generally planted outdoors, where it thrives remarkably well; it and many others thriving well in the open spaces in Rhododendron beds or anywhere, the soil being rich and light.

**ROSE MEDEWIND (Idem).**—The leaves show mildew, and is unquestionably a result of a poor soil and the want of moisture. Water freely in dry hot weather, and after the buds show, with weak liquid manure twice a week, or sprinkle guano lightly around the bushes, and wash in with water. It is necessary in the evening of hot days to water overhead, except when in bloom. The soil would be the better of a good dressing of manure. The mildew is a consequence of the dry east winds that prevailed some time ago, followed by the heavy rain.

**OLIMBER PROPAGATION (A. T. W.).**—Take cuttings of the current year's shoots when they are about half ripe, and insert them singly in small pots in sandy peat and loam, and place in a bottom heat of 60°, and cover with a bell-glass if in a house, but in a shaded hotbed the moisture will be sufficient to maintain the leaves fresh without resorting to the bell-glass. In inserting the cuttings let the base of each rest on sand and be surrounded by silver sand. Cuttings of the firm young shoots root freely in phials of water placed in heat. Either mode may be practiced now if your plants have the wood of the proper degree of ripeness.

**POPPY (Idem).**—The kind with large scarlet flowers 9 inches across is *Papaver bracteatum*, and the yellow the Iceland Poppy, *P. nudicaule*. Seed of the first-named may be had of most seedsmen, but of the latter seed is not, that we are aware, sold, but plants may be obtained of most nurserymen at a very moderate price.

**GRAPES CRACKING (J. E. W.).**—We should not attribute the cracking to the dryness of the border now; but from its having been dry during the first swelling of the berries, and now they are taking the second swell the border, from the excessive rains, being very wet, the atmosphere also moist, would appear to us the cause of the cracking. Apply more heat, so as by freer air-giving to keep the atmosphere less close and drier.

**POMEGRANATE NOT FLOWERING (E. D. R.).**—It does not flower because the wood is not thoroughly ripened. Against a south wall in your climate it would probably flower well were you to encourage the small twiggy growths and restrict the stronger shoots. If you wish to keep in a pot, place it in a light airy part of the conservatory, afford water only to keep it from flagging, and in winter keep dry. When it begins to grow in spring repeat, and encourage growth in a moist growing heat, as that of a vinery, and when the pot is full of roots remove to the conservatory, assigning it a light and airy position. It is not necessary to place in heat if the plant is not disrooted, which we advise, so as to keep in a moderate-sized pot. Pruning is to be done in spring, preserving a majority of the twiggy shoots.

**DESTROYING ANTS (Subscriber's Daughter).**—Trap them, saucers of salad oil being placed so as to allure and drown the industrious but annoying and destructive creatures. The oil will need to be renewed occasionally, as the ants will not enter to partake of it when rained. The White Mullein (*Verbascum Lychnitis*) is not rare but local in its distribution, yours being a new locality for it.

**NAMES OF PLANTS (Orateur).**—*Escallonia macrantha*, introduced from Chile in 1847. It requires a south wall and the protection of a mat in severe weather. (*J. Kerslake*).—The *Michaelmas Daisy* (*Aster tripolium*, L.). (*E. J. S.*).—Your second batch of Ferns does not correspond altogether with that previously sent, which we named in *Journal of Horticulture* for Aug. 6th. No. 2 of last lot is *Asplenium viviparum*. (*Mrs. Cheamley*).—Yes, a Spirea, but we cannot determine the species from specimen sent. (*Thos. O'Grady*).—*Rubus odoratus*. (*G. B.*).—1, *Lepidium Draba*; 2, *Geranium dissectum*; 4, *Beta maritima*. Remainder quite unnameable. Grasses apparently dried for ornamental purposes. (*G. P.*).—*Escallonia macrantha*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### MOULTING.

**FEATHERS everywhere**—in the houses, in the runs, in the dust-baths. We are glad to see them. We watch our birds becoming daily more ragged and more naked with the greatest pleasure. We delight in early moults, and we believe they will be general this season. These hot suns succeeding the late severe rains seem to have had a wonderful effect upon the birds, and the moult is feathers everywhere.

Last year the moulting was a late one. We had birds not ready to show till January, and it was a recognised fact that at the Palace the majority of the old birds wanted five or six weeks more to attain their full plumage. To have valuable show birds well over their moulting is a grand thing to accomplish, for the winter successes depend upon it to a great extent. It is not a very easy thing somehow to have highly-bred fowls well over their moulting, for many a good bird succumbs in inexperienced hands. We have known people buy-up valuable birds, exhibit them through the summer, and then expect them to come out as fresh as ever in the autumn dressed only in fresh feathers. Alas! they are often disappointed, for the bird is perhaps two or three months perfecting his plumage, and when it is fully grown it often looks patchy, or many of the feathers come discoloured, and the whole effect is rough.

We are convinced that birds which have been exhibited much during the summer usually moult-out but badly. They seem to lack strength to form new feathers quickly, and often waste away. We have noticed time after time individual birds which have won in August and September, but have not been fit to show again till January.

The plan we always adopt is, about the first week of August to turn all our hens together into a good orchard near where there is a house large enough to accommodate them all, and there we leave them to moult naturally, feeding them well but not giving them enough to make them sleepy or fat—we are here speaking of the large breeds of fowls—and letting them have a copious supply of clean water. We do not pretend to recommend any particular feeding. This must be left to the discretion of the manager, as different birds and different strains have different peculiarities, and consequently here the manager must use his judgment; but we again state the hens must be kept in good order, and allowed to become to a certain extent heavy without approaching the possibility of being internally fat.

When we find two or three hens are losing their feathers faster than the rest and seem to be going in for a quick moult, then we take those away and place them in enclosed shady runs about 8 feet square, where there are no draughts, and get them on as fast as possible for the early autumn shows. The floors of these pens we make 4 inches deep of clean sand, and cover the top with coarsely-cut straw chaff. We find generally the birds which have to come to these little runs to be made ready for the early shows are those hens which have not been exhibited for some time, and which have been allowed to have broods of chickens. The remainder of the hens moult-out, as we said before, naturally in their large run, and are singled out later on for the breeding or show pen as required.

In the case of all light-coloured birds we would be careful not to use maize in excess. We have seen many a bird ruined, especially cocks, for the show pen for the year, through the excessive use of this food, for it has a very bad effect on the feathers and makes them yellow and coarse, and in White birds often almost straw-coloured.

Thus much for our treatment of hens in the feathering season; now for a word about the cocks. We find small runs best for them; in fact, the large feathered-legged breeds should always be kept in such places in the moulting season, and when once the feathers begin to drop it is surprising how quickly they get their fresh ones when thus confined. If there are many cocks to moult, and the number of these pens is limited, we have known large exhibition baskets used with success. We do not mean a bird is to be kept in one during the whole of his moult, but by keeping a cock in one for three or four days, and then putting him in a run, taking the cock which has been living in that for a little sojourn in the basket, and so changing them about, seeing at the same time they are kept clean and well-attended to—we have, we say, thus often known many valuable birds belonging to people with but very small accommodation brought successfully through the moult. We feed the cocks on the same food as we do the hens—good sound ground and whole corn, with a little Spratt's, but we sometimes add a pinch of some condiment if they seem to be at all dull, and this often appears to give the new feathers a fresh start.

Those who want to put up a certain cock over a year old for breeding early January chickens, we would recommend to let such a bird moult as naturally as possible, and not exhibit it till the required chickens are hatched. We are sure that cocks moulted in places heated artificially or treated in any way contrary to nature, or, again, cocks frequently exhibited in November and December as soon as they have their new feathers, are but very rarely the fathers of early chickens, for in runs where this has been the case we have repeatedly noticed sitting after sitting of clear eggs. It is consequently important to have the birds to be bred from well over their moult early, and then reserve them entirely for the breeding pen. If hens have laid just before they begin to moult it is often a good plan to let them sit on nests of china eggs, keeping them in good condition all the time. The old feathers seem to come off so cleanly, and the new feathers sprout up as thickly as possible. We shall never forget going to see Mr. Pares in 1869, and finding in July all his champion Brahma hens sitting to assist them over their moult in good time. We have found, too, that a frequent application of sulphur ointment to the legs of the feather-legged varieties is often of great service during the moulting season, as it keeps the legs free from coarse scales and scurf disease, and seems to help the growth and development of the foot and leg feathers at the same time.—W.

#### ALEXANDRA PALACE POULTRY SHOW.

As will be seen by our advertising columns the arrangements for this Show have been concluded, and the Exhibition will be held, as originally announced, on the 19th, 20th, and 21st of October, 1875. All the poultry classes are to be for birds bred

this year, and there will also be classes for many varieties of young Pigeons.

As this will be the first show of chickens held in London—in fact the first great chicken show of the season—we may expect to see most of the future champions brought out which will do battle for their owners at the principal winter exhibitions, especially as we hear the cups are to be very numerous, and the money prizes of considerable value.

#### ALFORD SHOW OF POULTRY, &c.

THE annual Show was held at Alford on the 8th and 4th inst. in an extensive pasture close upon the town. Considering the population is so sparse in this locality this was a spirited venture, and the spirit and energy of the Committee most commendable. The pens were Billett's of Southampton, and were well arranged in double tiers in the centre, and singly on the sides. In poultry the entries were not large, no doubt on account of the occurrence of other shows at the same time; they were 163 in all, but the winners were generally good.

Of *Dorkings* two pens were good and the rest rubbish. *Cochins* poor, except the first, a fair pen of Buffs. In *Brahmas*, Light, the first were a good pair, the second a grand cock with a hen in fine feather, colour, and marking. This must be a very late-hatched bird of last year. *Brahmas*, Dark, were pretty good but a little shabby in feather. *Spanish* a grand lot; three entries. In *Red Game* cocks the winner of the cup was the bird in the same position at Doncaster, a Brown Red, and Game all over; second a capital Black Red, and third Brown Red. In *Red hens* Brown Reds were the winners, and were all good, the first especially. In the Variety of cocks *Duckwings* won the first, a very good bird in all points, but the others were only moderate. *Duckwings* were also the recipients of the honours in hens. The winners good, the first most noticeable for style, and second more for colour and marking. *Hamburgs* a fair lot, Messrs. Robinson, Long, and Pickles coming in for the prizes. *Silver-pencils* good, but not particularly nice in comb. *Golden* a little faded, but comb good; *Silver-spangles* being better, and *Golden* best, and the cup awarded here. *Game Bantams*, with a few exceptions, were poor, but there were some fair *Silver Sebrights*, to one of which the cup was awarded. In *French* were two classes but only six entries, but there were some pretty good birds in each. *Polish* were pretty good, and all *Golden*. In the Local class nice *Gold Polands* were first, *Houdans* and *Brahmas* taking the other prizes. The *Selling* classes were a marked contrast to what we generally see at this time of year, some of the birds being very good, Messrs. Newbitt's *Spanish* and *Wren's* *Brahmas* particularly so. Pen 856 (Low) contained a cock with a spur growing out of the centre of the head, which, though detached from the skull, was grown to the flesh, and in our opinion had been inserted after the removal of the comb, this and the wattles being evidently cut. *Chickens* were pretty good as a class, *Dark Brahmas* and *Dorkings* dividing the prizes.

*Bouen Ducks* were good, but of *Aylesbury* there was only one pen; and in the Variety *White-faced Whistlers* were first, *Domesticated Mallard* second, and *Cross-bred* third.

Of *Pigeons* there were about 135 entries, and the show at Driffield occurring at the same time, it is surprising that the entries were so large in these and the Rabbits. With Messrs. Filton, Hammock, Yardley, Ord, and Woodhouse as exhibitors little need be said of the general quality of the birds. *Carrier* cocks were all noticed, and the cup for the first section was awarded to a grand *Black*, well developed in beak and eye wattle, very good in colour and style; second a strong young *Dun*, and third a good *Black*, but with a stiff wing. *Hens* also good. First *Black*, a *Carrier* all over, and a capital match for the first cock; second *Black*, not so heavy, and third *Dun*, wanting only in neck. All noticed. Many of the *Pouters* were a little shabby in feather, but were good classes. In cocks first a *Blue* in fine show, second a *White* quite as well up, and third a *Black* well marked, very sound in colour, but rather short. All were noticed, as also in hens, where the first was *Black*, second *Black*, and third *White*. *Tumblers* were an excellent lot of *Almonds*. First a cock very rich in ground and perfectly broken, with grand head properties, but slightly cloudy at the corner of the eyes; second grandly broken, a little darker; third beautifully broken, not so rich, and Mr. Yardley's out of feather and looking ill. In *Balds* and *Beards* first was *Black Bald*, perfect, but wanting a moult; second a *Silver*, good, but lost in head a little, and foul on one thigh; third a grand *Blue Beard*, but rather lame. *Barbs* only a moderate class; first *Red*, and second and third *Blacks*. With the exception of the first *Red* cock the *Jacobins* were poor. *Dragoons* good. First a *Blue*, second *Yellow*, and third *Black-barred Silver*. The cup for these classes was awarded to the *Almond*. *Fantails* were uncommonly fine, the three winning birds a close run, and all *White*. *Turbits* a nice lot, though some were a little dirty. First a *Blue* cock, second *Silver*, and third *Blue*. *Owls* were all foreign; the first and third *White*, and second *Blue*, the cup going to the first-named bird. In *Antwerps* first was a good

Short-faced Silver Dun, second a medium Red Chequer, and third a sound strong Dun medium. In the Variety class first was a Black Trumpeter, second Black Turbiter, and third a Grey Frillback. Carriers of this season were a strong class in Black and Dun, and were mostly noticed. The first Black hen, second Black cock, and third Dun. In the following class all were Blues, and very good. In the Selling class the first were Blue Carriers, and second and third Antwerps. Mr. Fulton won the point cup.

Of Rabbits were 111 entries, and a good display they made. Lops, Self-colour, came first, the winner a Sooty Fawn doe 23 by 4½, was a truly grand Rabbit; second, 21 by 4½, a Fawn buck; third, a Smutty Blue 21½ by 4½. The rest were poor. In any Broken-colour, first was a splendid Tortoiseshell doe 21½ by 4½; second, a Fawn and-white doe 21½ by 4½; and third, 21 by 4½. Belgian Hares a good class, the prizes going to colour and marking more than to size. The first a beauty but not in fine order. Silver-Greys were a sharp contest, and many good even Rabbits were shown. First a doe, second a doe, and third a buck but quite young. Himalayans a good entry, also the four best very close in points. First a small young Rabbit very well marked; second large and very good; and third also large. Pen 473 a grand Rabbit but moulting. In Angoras only the first was good but that very grand, the rest being young and mostly out of condition. Dutch not numerous but very good. First Grey, second Fawn, and third Black. In the Variety class Silver-Creams won the second, and so-called Siberians third. The Selling class was very good, the first a Fawn Lop, second Silver-Grey, and third Belgian-Hare.

We cannot commend the classification of the *Cage Birds*, which might be greatly amended, and yet there was a fair show. In Parrot and Paroquets first was a good Grey, and second African Love Bird. The first-prize Belgian was a gem, but the rest poor. Norwich only a moderate lot. In the Variety first and third were Mealy Yorkshires, and second a Cinnamon. The Mules were well placed, the first a Jonque, and all of the Gold-finch cross, and Variegated Linnet or Finch poor, but Larks very good.

Cats were a good show. Lion, the champion Cat, low in condition, was fairly beaten by another Tabby. Foreign Cats were a good class; the winners, White Angoras, very good.

**BALDS OR BEARDS.**—Cock or Hen.—1, R. Fulton, 2 and 3, W. Woodhouse, King's Lynn. 4, T. Holmes, Lower Sydenham; R. Fulton.  
**BARS.**—Cock or Hen.—1 and 2, R. Fulton. 3, E. G. Cave. 4, C. Norman, Westfield. 5, H. Yardley.  
**ACORN.**—Cock or Hen.—1 and 2, R. Fulton. 3, W. Parkinson, Doncaster. 4, W. Woodhouse.

#### CAGE BIRDS.

**PARROT, PARROQUET, OR ANY OTHER FOREIGN BIRD.**—1, C. E. Grundy, Boston. 2 and 3, J. Coker, Hull. 4, E. B. Mason.  
**CANARY.**—Belgian.—1, W. T. Simonds. 2 and 3, Knight & Spencer, Arlesey. 4, B. G. Cave. 5, T. F. Shimels.  
**MARKET BIRD.**—1, F. Bamber, Alford. 2, any other variety.—1 and 2, E. Tomlin. 3, T. F. Shimels. 4, Knight & Spencer (3).  
**MULE.**—1, J. Moore. 2 and 3, E. Tomlin.  
**LINET OR FINCH.**—1 and 2, Knight & Spencer. 3, W. T. Simonds. 4, E. Tomlin. 5, R. Ross, Poole.  
**LARK.**—1, F. A. Woodthorpe, Boston. 2, E. Ross. 3, T. Hobster, Boston.  
**THRUSS OR BLACKBIRD.**—1, T. Hobster. 2, J. Aitken. 3, J. Aitken, Alford.  
**ANY OTHER ENGLISH CAGE BIRD, OR OTHERWISE.**—1 and 2, Knight and Spencer. 3, F. Bamber (English Hawk).  
Points Cup won by Knight & Spencer.

#### RABBITS.

**LOP-EARED.**—Self-coloured.—Buck or Doe.—1, T. Schofield, Manchester. 2, H. Pickworth. 3, G. Conyers, Hull. 4, W. Nottage, Northampton. 5, Broke Colour.—Buck or Doe.—1, T. Schofield. 2, E. Greaves, Grimsby. 3, H. Pickworth. 4, W. Rhodes, Spilby. 5, T. Schofield. 6, J. Barker, Louth; J. T. 7, T. Schofield. 8, J. E. Pilgrim, Hinchley. 9, Livett; 10, H. Whitan, Boston; 11, B. Greaves. 12, B. Greaves. 13, F. Purser, Bedford. 14, B. Greaves. 15, T. 16, Humber; 17, B. Greaves; 18, T. Schofield. 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.

#### CATS.

**ENGLISH.**—1, T. J. Wood, Boston. 2, E. Baxter, Dalston Lane. 3, D. Mount. 4, Alford.  
**FOREIGN.**—1, T. Weightman, Hatfield. 2, E. Clark. 3, C. E. Barry, Horncastle. 4, Mrs. L. N. Bradley, Alford; 5, E. Clark.  
**JUDGES.**—Poultry: Mr. Tebbay. Pigeons and Rabbits: Mr. E. Hutton. *Cage Birds and Cats*: Mr. Billett.

#### WHITWICK SHOW OF POULTRY, &c.

This was held August 3rd. The Judge was Mr. James Dixon, North Park, Clayton, Bradford, Yorks.

**GAME.**—Black and Brown-breasted Bader.—Cock.—1, J. Richardson, Loughborough. Hen.—1, T. Tillotson, Coates, Leeds. 2, J. Richardson. 3, J. Moo. 4, Gifford, Leicester.

**GAME.**—Any other variety.—Cock.—1 and 2, Earl of Londoun. 3, S. Perry. 4, B. Ball, Burton-on-Trent. Hen.—1, E. Ball. 2, J. Richardson. 3, H. 4, W. Wood, Worcester. 5, W. Tillotson.

**DORCHES.**—Hen.—1, W. H. Crews, Etwall. 2, T. E. Pilgrim, Hinchley. 3, R. Hill, Nottingham. Hen.—1, Hon. G. Hastings, Donington Park. 2, R. Hill.

**COCHINS.**—Cock.—1, H. Tomlinson, Birmingham. 2, W. H. Crews. 3, E. L. Draper, Burton-on-Trent. Hen.—1, H. Tomlinson. 2, E. L. Draper.

**BRAMMAS.**—Cock.—1, W. Whitley, Sheffield. 2, H. Feast, Swans. 3, T. 4, H. Feast, Humberstone. 5, H. Feast. Hen.—1, W. Whitley. 2 and 3, H. Feast. 4, C. Judson. 5, C. Judson.

**HAMPSHIRE.**—Gold or Silver-splashed.—Cock.—1, H. Feast. Hen.—1, H. Feast. 2, H. Feast.

**ANY OTHER VARIETY.**—Cock.—1, H. Feast. 2, J. E. Pilgrim. Hen.—1, W. H. Crews. 2, H. Feast.

**BANTAMS.**—Cock.—1, E. Ball. 2, J. Mayo, Gloucester. 3, J. Callie, Haver. 4, T. Cropper, Beccles. Hen.—1, A. L. Nixon, Barton. 2, J. Mayo. 3, T. Cropper, Beccles.

**DUCKS.**—1, Earl of Londoun. 2, W. H. Crews.

#### PIGEONS.

**CARRIERS.**—1, H. Yardley, Birmingham. 2, W. Sheffield, Whitwick. 3, H. Yardley. 4, Mrs. H. Pickworth, Monks March, Spalding.

**WATERS.**—1, J. F. Loveridge, Newark. 2, H. Yardley. 3, G. De Lisle. 4, H. Yardley. 5, G. De Lisle.

**ANTWERPS.**—1, H. Yardley. 2, A. Farndon, Hinchley. 3, G. De Lisle; J. Trivet, Hinchley.

**ANY OTHER VARIETY.**—1, J. Gamble, Hugglescote. 2, R. Williamson, Whitwick. 3, W. Siddons, Swanton.

**RABBITS.**—1, H. Pickworth. 2, W. Hunter, Walsall. 3, A. Fletcher, Thetford; W. Kirby, Hugglescote; J. Brotherton, Loughborough.

**CANARIES.**—Yellow.—1, T. Moore, Thringstone. 2, G. Gadd, Leicester. 3, any other variety.—1, Kirk, Whitwick. 2, K. Arnold. 3, B. Gadd.

#### MANAGEMENT.

**CHEVRE-CORUM.**—1, W. H. Crabtree. 2, W. Dring, Faversham. 3, W. Dring, Faversham. 4, W. Dring, Faversham. 5, W. Dring, Faversham.

**POULTRY.**—1 and 2, G. W. Boothby, Louth. 3, H. Pickles. 4, T. Webb. 5, T. Webb.

**ANY VARIETY.**—Owner residing within twelve miles of Alford.—1, G. W. Boothby (Gold Poland). 2, J. M. Atkinson, Alford (Dark Brahmas). 3, E. Coney.

**BARTHOLOMEW OR CHROMER.**—Owner residing within fifteen miles of Alford.—1, W. Bramby, Alford. 2, E. Coney.

**SELLING CLASS.**—Price not to exceed 50s.—1, E. Newbitt (Spanish). 2, L. Wren, Lowestoft (Brahmas). 3, G. W. Waters. 4, L. Nutsay, Alford (Crève-Coeur).

**SELLING CLASS.**—Price not to exceed 50s.—1, Smith & Taylor (Buff Cochins). 2, E. J. Wells (Dark Brahmas). 3, G. W. Waters. 4, Mrs. F. Cropper, Horncastle (Light Brahmas).

**BRAMMAS (Light or Dark), COCHINS, OR DORCHES.**—Chickens.—1, W. E. Gaver, Dyke (Buff Cochins). 2, W. H. Robson, Neepham (Coloured Dorchs). 3, Hon. Mrs. A. B. Hamilton, Blidmont, Woburn (Dark Brahmas). 4, T. Webb (Light Brahmas). 5, W. Santon, Driffield (Buff Cochins). 6, R. Foster, Alford (White Cochins). 7, J. Harvey, Louth (Dark Brahmas). 8, R. Taylor, Alford (Light Brahmas). 9, J. H. Christian, Alford (Light Brahmas).

**ANY OTHER VARIETY.**—Chickens.—1, W. Dring (Hondans). 2, A. Kibben, Westham (Brown Leghorns). 3, L. Nutsay (Crève-Coeur). 4, W. Bygott, jun., Eye Hill (Sebrights).

**DUCKS.**—Bacon.—1, W. H. Robson. 2, D. J. Greenwell, Alford. 3, W. Bygott. 4, E. E. Clarke, Epsom. 5, C. Brookes, Spilby. 6, W. H. Robson, Epsom. 7, L. Gulliver, Arlesey. 8, any other variety.—1, M. Lemo. 2 and 3, C. Brookes. 4, G. Moore, Burgh.

#### PIGEONS.

**CARRIERS.**—Cock.—1, Plate, and 2, R. Fulton, Bromley, London. 3, W. G. Hamcock, Ilford. 4, H. Yardley, Market Hall, Birmingham. 5, H. Yardley and Dye, Hetham. 6, C. G. Cave, Spalding. 7, M. Lemo. Hen.—1 and 2, R. Fulton. 3 and 4, H. Yardley. 5, H. Yardley. 6, H. Yardley. 7, H. Yardley. 8, H. Yardley. 9, H. Yardley. 10, H. Yardley. 11, H. Yardley. 12, H. Yardley. 13, H. Yardley. 14, H. Yardley. 15, H. Yardley. 16, H. Yardley. 17, H. Yardley. 18, H. Yardley. 19, H. Yardley. 20, H. Yardley. 21, H. Yardley. 22, H. Yardley. 23, H. Yardley. 24, H. Yardley. 25, H. Yardley. 26, H. Yardley. 27, H. Yardley. 28, H. Yardley. 29, H. Yardley. 30, H. Yardley. 31, H. Yardley. 32, H. Yardley. 33, H. Yardley. 34, H. Yardley. 35, H. Yardley. 36, H. Yardley. 37, H. Yardley. 38, H. Kirby, Donington.

### MELTON MOWBRAY SHOW OF POULTRY, &c.

AUGUST 5TH.

This was a nice small Show, but the Committee were backward in their arrangements, owing, no doubt, to the system of double numbers which they had adopted. Mr. Hewitt was Judge.

**Dorkings** were few; first a very neat pen in nice trim, second a fine hen but a bad cock. **Spanish** were good in lobe and face, the first being the best hen, and the second the best cock. Only one pen of **Buff Cochins** was entered. The first, Whites, were excellent; second, moderate Partridge; third, poor White. In **Light Brahmas** first were old and second neat young birds, not heavy enough in feather; third a fine cockerel but light in hackle, with a lovely pullet. In **Darks** first were a fine old pair of great size, second a pretty cock of perfect colour but a poor hen, third fair only. **Hamburgs** were the strongest classes in quality; the first Pencils were Gold, in grand feather, the cock perfect in head and tail; second a rich cock, deficient in other points; third a good cock and poor hen. In **Spangles** first a fine pen of Golds in grand feather, the hen perfect, but the cock was too much laced on the wings; second also Gold, the hen too dark, but the cock good; third Silver, the hen very good, but the cock hollow in comb and very white on the back and saddle, being far inferior to the two highly commended pens. In **Red Game** first were Brown Reds of fair colour with a very drooping tail, second a fine pen of Black Reds. In the next class, first a very light pen of Duckwings, second beautiful Duckwing chickens, third fair Duckwings. There was only a single Game cock, but he was out of condition. In **Houdans** first a fine cock in nice trim, second a fine cock of good colour with a poor hen, third fine chickens. In **Orpingtons** the first cock was rather high in tail, and the hen only fair; second a good cock, with a far better hen; third a fair pen of old birds, the chickens being passed on account of their Houdan combs. In the Variety class Silver Polands were first, the cock very good, but the hen poor; a poor pen of Black Hamburgs second, and a much better pen third. In **Game Bantams** first were neat Black Reds; second Piles, the hen very good, but the cock big and coarse. Capital Blacks were first in the Variety class, second White-booted with very bad combs, and third very moderate Black chickens. **Turkeys** were very fair, the first a fine cock, and second a nice hen. **Geese** were a large class, the winners all good. In **Ducks** the Aylesburys were fair, the first a fine drake, as was the second. In **Rouens** the first drake and second Duck would make a grand pen.

**Pigeons** were poor throughout. The first Carriers were a fine upstanding pair, but not of high quality. In **Tumblers** first were Almonds, and second Blue Baldheads. In **Fantails** first Blues, second and third White, the latter coarse. **Pouters** were White, and all moderate. **Jacobins** were Yellows of fair colour only. **Trumpeters** were all Black, most of them failing in rose and hood. **Archangels** were all poor in colour. In the Variety class we preferred the Swallows, which were capital Reds.

In the **Lop Rabbits** first was a grand well-known Sandy, second a fair White. Heavy Rabbits were a fine class, Lops winning; and in the Variety class first went to a Silver-Grey of rich colour, and second to a nice Angora, a good Silver-Grey being very highly commended. The young class was very interesting, Belgian Hares winning, Angoras second, and capital Lops highly commended.

In the Local classes we noticed nothing worthy of mention beyond Mr. Wild's Pencilled Hamburgs; the Game winners.

**DORKINGS.**—1, W. H. Crabtree, Manchester. 2, S. W. Hallam, Whitwick. 3, J. Ward, Bardon Hill.

**SPANISH.**—1, S. W. Hallam. 2, W. Whitworth, Manchester. 3, M. Brown, Kettleby.

**COCHINS.**—*Ostronome or Buff.*—1, W. H. Crabtree. *Any other variety.*—1, W. Whitworth. 2, J. Green, Coalville. 3, C. Wilson, Langar.

**BRAHMAS.**—*Light.*—1, W. H. Crabtree. 2, H. Feast, Swanscoe. 3, J. Long, Bromley. *Dark.*—1, W. H. Crabtree. 2, J. Long. 3, J. Green.

**HAMBURGERS.**—*Gold or Silver-pencilled.*—1, J. Long. 2, J. Ward. 3, J. Robinson. *Gold or Silver-spangled.*—1, T. Blakeman, Wolverhampton. 2, S. W. Hallam. 3, J. Robinson.

**GAME.**—*Black-breasted or other Reds.*—1, E. Winwood, Worcester. J. Mee,

Ashby-de-la-Zouch. *Any other variety.*—1, E. Winwood. 2, E. Bent, Burton-on-Trent. 3, W. Tiltson, Leeds. *Any variety.*—Cock—1, E. Winwood.

**HOUDANS.**—1, W. Whitworth, jun. 2, G. W. Hibbert, Manchester. 3, W. Dring, Faversham.

**CASTS COUSAS.**—1, G. W. Hibbert. 2, W. H. Crabtree. 3, W. Dring.

**ANY OTHER VARIETY.**—1, W. Whitworth, jun. 2, J. Robinson. 3, J. Long.

**BANTAMS.**—*Game.*—1, E. Bell, Burton-on-Trent. 2, Mrs. Deacon, Oundle. 3, R. J. Heartley, Altrincham. *Any other variety.*—1, J. Mayo, Gloucester.

**TURKEYS.**—1, N. Whitechurch, Melton. 2, Mrs. Goy, Eaton, Grantham.

**GEES.**—1, Mrs. Deacon. 2, H. Wyman, Conington, Peterborough. 3, N. Whitechurch, Melton.

**DUCKS.**—*Aylesbury.*—1, E. Snell, Barrowden. 2, Mrs. Deacon. *Rouen.*—1 and 2, J. Wyles, Melton. 3, H. Gill, Holwell, Melton.

#### PIGEONS.

**CARRIERS.**—1, W. Nottage, Northampton. 2, H. Parker, Long Eaton.

**TUMBLERS.**—1 and 2, H. Yardley, Birmingham.

**FANTAILS.**—1, H. Yardley. 2, J. F. Loversidge, Newark.

**POUTERS.**—1, W. Nottage. 2, H. Yardley.

**JACOBINS.**—1, H. Yardley. 2, W. Haseldine, Melton.

**TRUMPETERS.**—1, W. Gamble, Thorpe Satchville, Melton. 2, H. Yardley.

**ARCHANGELS.**—1, H. F. Hinde, Dalby Vicarage, Melton. 2, — Andrews, Melton.

**ANY OTHER VARIETY.**—1 and 2, H. Yardley.

#### RABBITS.

**GREATEST LENGTH OF EAR.**—1, Mrs. H. Pickworth, Moulton Marsh. 2, T. S. Barrows, Leicester.

**HEAVIEST.**—1, J. Spencer, Melton. 2, — Philips.

**ANY VARIETY.**—1, F. Purser, Bedford. 2, Mrs. Snell, Barrowden.

**PAIR UNDER TWELVE WEEKS OLD.**—1, F. Sabbage, Northampton. 2, Mrs. Snell.

#### LOCAL CLASSES.

**DORKINGS.**—1, N. Whitechurch, Melton. 2, M. Kew, Market Overton.

**SPANISH.**—1 and 2, M. Brown, Kettleby.

**COCHINS.**—1, C. Wilson, Langar. 2, M. Kew.

**BRAHMAS.**—1, C. Wilson. 2, J. Hall, Statham, Melton.

**HAMBURGERS.**—*Gold or Silver-pencilled.*—1 and 2, T. Wild, jun., Melton.

*Gold or Silver-spangled.*—1, T. Wild, jun. 2, H. Kidger, Owston.

**GAME.**—1, F. Willford, Statham. 2, A. Peake, Somerby.

**ANY OTHER VARIETY.**—1, J. Morley, Sysconby. 2, M. Kew.

**BANTAMS.**—1, J. O. Faget.

**DUCKS.**—1, H. Gill, Holwell, Melton. 2, M. Kew.

**PIGEONS.**—*Any variety.*—1, W. Haseldine. 2, W. Latham, Melton.

**RABBITS.**—*Any variety.*—1, W. Haseldine. 2, J. W. Priestman, Melton.

**JUDGE.**—Mr. E. Hewitt, Sparkbrook, Birmingham.

### GREAT HORTON SHOW OF POULTRY, &c.

This annual Show was held on the 7th, the site of which we must pronounce badly chosen, two small fields and half a street being used for the purpose, and up one side of the latter the pens were placed against a garden wall. These were well arranged, and on Turner's principle, the numbers being for poultry 99, Pigeons 102, and Rabbits 20. The morning was very close but fine. The arbitrations, not commencing till noon, were not completed till nearly two o'clock, when it commenced to rain, and continued a perfect downpour the whole of the day, and no tent or other cover being provided most of the specimens had a perfect drenching, although an attempt was made by some members of the Committee to protect with planks.

**Game** had six classes with one cup, which was won by Mr. Aykroyd. In single cocks, Brown Reds, first was in good feather, a capital colour, but long-bodied and broad in sickle; second a fair bird, deep in moult. Pen 4 (Sugden) one of the best, ought to have been noticed. Black Reds were much faded, but as Game, were pretty good. In Any other variety first was a Pile and second Duckwing. Brown Red hens were very good, and here was one which we at once dubbed Sweep on account of the intense blackness of both face and legs, yet it won't do, and deserved disqualifying. The first in hens any other colour was a Duckwing, but in very bad feather; second a Pile, a moderate lot. A class for Game chickens brought out the best of the Game classes, the winners Brown Reds; the first dubbed, the second undubbed and more to our taste, there being also some good Duckwings. **Spanish** were a very good class, and it is matter of surprise these birds carry their feathers so long and well. In **Cochins** first were Buff and second White, two good pens. **Brahmas** were of the Dark variety, the first hen good in pencilling, the second cock best of the two, and rightly placed. **Hamburgs** were not numerous, but were a good section; in fact, it would be difficult to bring a better lot together. In the Variety the winners were Polish, the first Silver and second Gold. Partridge Cochins came to the front in chickens, and though good we do not think them equal to what we have seen from the same yard in previous years; second Light Brahmas, large and good; and third White Cochins. **Bantams** were in very good condition, and some good birds were shown. In **Ducks** Rouens won, both pens being very large.

**Pigeons** came next. Of Pouters only two entries, both Blue. Carriers were more numerous, but mostly very young birds, though quite promising, the only bird of any weight being Mr. Yardley's Black cock. In Dragons first was a Yellow, very good, but greatly faded of late; second a fair good Blue, and the rest a moderate lot. English Owls a pretty good lot. First and extra a Silver cock, and second a Blue; several others well mentioned. Turbits were badly placed. First a Red hen, very plain in face, with neither gullet nor hog mane; and second a very coarse Yellow, by far the best being No. 6 (Rhodes), a Silver cock, and second Yardley, a Silver cock. Tumblers were good, the first Red and second Black Mottles were rightly placed; some capital Black Balds were highly commended. Of Barbs

only two good Black cocks. Jacobins bad. Antwerps (Long-faced) were very good; Red Chequers won, but the second had a white beak, and might have been replaced with a better in Pen 5 (Ellie). Antwerps (Short-faced) were well placed, and the winners Silver Duns. In Medium-faced first was Blue and second Silver Dun, both good birds. In the Variety first was a Blondinette, and second Red Swallow; no name in the catalogue. In the Selling class Blue Owls were first, and a Black Barb second.

Lop-eared Rabbits were a moderate lot; both winners were Tortoiseshell does; the length we could not ascertain, as they were measured with a stick only. Himalayan were rightly placed, but the ears of the first-prize one were far too large. In the Variety class was a horrid mistake, the first going to a Rabbit for which no name but incorrect will fit, being evidently a cross between a Dutch Angora and Lop, the second going to the worst of three Silver-Greys. Pens 3 and 4, two Silver-Greys, should have been placed first and second at a look. Pen 6, highly commended, was Angora.

Dorkings headed the list; these being a fair lot. Chickens of this variety were good; the second the largest, but the cockerel had one spur outside his leg. Brahmas, Light, old and young both good as regards the winners, although the second-prize cockerel was a little yellow on the wing-bow. Dark Brahmas were not as good as the Light. In Game were many good birds, the winners being only superior in feather; the first and third were Brown, and second Black-breasted Reds; a capital pen of Duckwings being very highly commended. In Game chickens the winners were all Black-breasted Reds of very promising quality. Spanish were a grand lot, and the competition close; the second losing in comb only. The chickens of that variety were very good. In Cocks the winners were Buffs and good. Only one pen of chickens were shown, and these of that colour also. Hamburgs were mixed classes, Spangles and Pencils competing together, and they were very good in both classes. In Golden, Spangles won first and second, and Pencils third. The third prizes in most cases being awarded as extras; some prizes were withheld in the classes where the quality was poor. In Silvers, Spangles were first, and Pencils second and third; these were very good. Poland poor; first Black, and second Silver. Black Hamburgs good; but Mr. Pickles' pen empty. Game Bantams poor except the first Black-breasted Red; but in the next class the Blacks were good.

Ducks, Aylesbury were of very good quality; Rouens moderate; but the Variety poor after Mr. Silvester's were excluded. Geese and Turkeys were very poor, which is very uncommon in this quarter; but there were some fair birds in the Selling classes, especially the first-prize Rouen drake.

DOCKINGS.—1 and 2, E. Leyshon, Bridgend. 3, H. Feast, Pantyffynon. 4, J. Saunders, Corntown, Bridgend. 5, A. Aldrich, Talgarth. 6, H. Leyshon. 7, E. Packer, Porth.

24	Tu	Autumn Show of the Metropolitan Floral Society at Cardiff and Barton-on-Trent Shows.	71.6	47.9	59.7	1 5	8 7	55 9	41 2	20	2 12	236
25	W		74.1	49.7	61.9	8 5	1 7	44 10	0 4	21	1 55	237

From observations taken near London during forty-three years, the average day temperature of the week is 72.5°; and its night temperature 49.4°.

## GEMS OF THE HERBACEOUS BORDER.

AM not among those who would have one style only of ornamental gardening. There are spots where masses of colour are almost indispensable, and when the colours are well arranged everyone who is not hopelessly prejudiced cannot help admiring the picture before him. But "bedding plants" do not require constant attention like border flowers, and consequently have not the power of drawing out our affection towards them.

We do not recognise them individually; we count them by the dozen or hundred; they merely represent so many pounds and shillings, for we know if we lose them we can buy plenty more exactly like them. Plants which are reared by ourselves and fondly tended for years, on the other hand, are like our own children, which, of course, we are quite certain are better than those of any other person; and if any are sickly or delicate, and require extra attention, it only makes them more loveable. On this account, as well as on the score of good taste, I am sorry to see in many old-fashioned cottage gardens such plants as Geraniums and Calceolarias usurping the place of the good old border flowers which were common a few years ago. Brompton Stocks, the sweet old Cloves, White and Tiger Lilies, Tulips, Anemones, Sweet Williams, and Gilliflowers are now the exception where they used to be the rule. I do not miss them so much from our great gardens, but from our rustic village cottages they are a sad loss. Fashions, however bad, will run through all the different grades of society, and while lords and dukes continue only to cherish gaudy colours, their humbler cottagers will surely imitate them, even though the imitation is little better than a caricature. This year so far has been a sorry one for the tender bedding plants, and I am in hopes that some good will spring from it; certainly, what I have seen presents anything but a respectable appearance, chiefly owing, I believe, to the want of solar heat. On the other hand, the herbaceous borders never looked better, and as the late-flowering plants are making excellent growth, we may fairly expect them to be interesting for another three months.

Our family not being here till August, we exclude from our borders all such plants as flower before that time, and judging from our own practice, I think if I were to grow a general collection of herbaceous plants for flowering at all seasons I should take into consideration their time of flowering, and arrange them accordingly. There might be spring, summer, and autumn-flowering sets, either separately planted where they need not be visited out of season, which would be the least troublesome and most satisfactory plan, or so arranged altogether that there would never be any great blanks.

Herbaceous plants require a great deal of attention, and let no one take to them with the idea that because they are hardy they require less attention than bedding plants; they will find that they need at least four times as much, and the labour employed on them must be of

a higher kind—skilled labour compared with that employed for picking over or planting a bed of Geraniums. Anything which can be done by line and rule is easily taught to the dullest of pupils, but work requiring taste and thoughtfulness is extremely difficult to teach to labourers and the rising generation of young gardeners.

A badly-managed herbaceous border, where the plants are either falling about or bundled together like faggots, and where a struggle for existence is going on between weedy giants and diminutive gems, is a detestable sight; but a border where the plants are well arranged for height and habit—colour is almost secondary—and receive careful daily attention without showing too much the marks of the workman, I have lately found by my own incomplete arrangements receive a greater share of attention from people of cultivation than do all the rest of the garden. And no wonder. Look at it in the way of furnishing cut flowers for the drawing-room. I would at the present time challenge three or four ordinary stoves to produce such a display as I could gather from my herbaceous borders, and you may cut and come again without anything being missed. "Rubbish!" did you say? Your *Allamanda* will not compare with my *Coreopsis lanceolata* or *Oenothera Fraseri*. My *Anemone Honorine Jobert* is no mean rival to your *Eucharis*, lovely as it is, and will flower continually for six months without being died *à la* Banting. You have no match at all for my *Agapanthus umbellatus*, which if not strictly hardy or herbaceous, only requires lifting in December and placing in a shed till spring. My *Monarda*, if not so perfect in a florist's narrow view, I greatly prefer to your bug-infested *Ixora*, and by candle-light it looks decidedly better than the *Ixora*.

Other good flowers for cutting are *Tritonia aurea* (perfectly hardy), *Schizostylis coccinea* (ditto), *Potentilla Hopwoodiana*, *Achillea ptarmica plena*, *Pentstemons* in variety, and to these may be added *Fuchsias* and Sweet Peas, for I do not exclude plants which are not hardy and herbaceous if they happen to harmonise with the general occupants of the border, and possess colours and other qualities of which there may be a deficiency.

Plants are sometimes required to temporarily fill blanks which may occur, to give scent and sometimes to give colour where there is too much sameness. For these purposes I do not hesitate to use some of the better annuals, such as Ten-week and Intermediate Stocks, *Asters*, *Zinnias*, *Linum grandiflorum coccineum*, *Convulvulus minor* and Sweet Peas, and also *Heliotrope*, *Salvia patens*, *Dahlias* and *Gladiolus*. *Chrysanthemums*, especially *Pompons* and other early varieties, are used largely, and are propagated annually from cuttings. The old roots all perished last winter.

Among the permanent occupants are the following:—*Aster tenuifolius*, *Fortunaea longifolius variegatus*, and *patens*; *Oenothera riparia*, *macrocarpa*, and *Fraseri*; *Gentiana gelida*, *acaulis*, and *asclepiades*; *Anemones japonica*, *vitifolia*, and *Honorine Jobert*; *Mimulus* in variety; *Polygonum Braunii* and *vacciniifolium*; *Solidago multiflora*, also a dwarf variety of the same from 12 to 18 inches

high; *Lilium lancifolium album, auratum, tigrinum*, and a variety of *Lilium candidum*, with a broad yellow band on the foliage. This is splendid in winter; certainly no summer plant with variegated or golden foliage can compare with it, and it is perfectly hardy. *Funkia*, *Tigridia*, *Zauschneria californica*, *Alströméria*, *Bœconia*, *Clematis tubulosa*, *Achillea*, *Geum*, *Helianthus*, *Eryngium*, *Helleborus*, Winter *Aconite*, *Cotyledons* and Autumn *Crocus*, *Sterbergia*, *Tritoma*, *Bedum*, *Oxycelen*, *Erica*, *Pardanthus*, *Anomatheca*, *Geranium*, *Tricyrtis*, *Gypsophila*, *Gaillardia*, *Plumbago*, *Galatella*, &c.

For the possession of many of the above gems and for a great deal of information concerning them, I am indebted to our old friend George Wheeler of Warminster, now, alas! in his eighty-fourth year, but still as young as many a man at fifty. He has been nursing them for years in the hope that they would again become popular, and I need not tell how it gladdens the old man's heart to know that there is a probability of them again gaining favour with the public. May he live to see the day.—WILLIAM TAYLOR.

### MULCHING—ESTIMATE OF STRAWBERRIES.

I AM glad to hear Mr. Luckhurst has been making some practical experiments on top-dressing with manure or mulching, instead of forking, or rather digging-in manure. I must thank him for the compliment he paid me at the commencement of his remarks, which I fear I do not deserve. My experience still is strongly in favour of mulching, especially in the case of Strawberries, where I think nothing but a hoe should be used, and that lightly, but all runners and weeds should be kept clear of the beds; and I still think the winter mulching of manure had better not be put on the beds till the autumn growth is nearly ripened.

I see another of your correspondents as well as myself recommends chopped straw as a covering for the beds during the fruiting season. I tried barley chaff mixed with it, but it is apt to induce weeds, and I still think it is best to use chopped straw only. Let it be the best and cleanest straw, chopped short, but not too short, and it should be freely used, so as to cover the whole of the soil; and another word of advice, Let it be put on early before the Strawberries begin to swell and while the flower-stems are still able to stand upright. Give the beds a good soaking of liquid manure, then cover with the clean chopped straw about an inch thick; it need not be more, as if there is a greater covering it is apt to decay underneath. One great advantage of the chopped straw is not merely that it prevents dirt from being washed over the Strawberries in wet weather, but when beds are mulched in the winter with manure it is not all removed off the beds in spring, and decayed pieces of straw are left about the plants, which help very much in wet weather to induce decay in the Strawberries.

We had a very wet time during the best of our Strawberry season this year, and it was curious to notice how one injured berry would in some sorts spread the decay to those which were near. I can strongly recommend Lucas and Sir Joseph Paxton as first-class sorts for resisting wet. The sorts varied much; some that have woolly footstalks to the berries with a superabundance of calyx rotted at the crowns, others on the under side the berry. Persons can hardly be too careful in showery weather not to move the bunches of fruit about in gathering. The other sorts that stood well were President and Vicomtesse Héricart de Thury. I still think the latter, though hardy and a good bearer, a much over-rated fruit. Eleanor stands weather pretty well, but loses much in flavour. I do not care much for either Aromatic, Royalty, Sabreur, or James Veitch. A sort I had given me by a friend, called Comte de Zahn, was a very prolific bearer, and I have no doubt in a strong soil would be valuable, but it evidently has very hairy leaves with a great many stomata or breathing spores, and I find the leaves flag in the sun. Does anyone know anything of it? Ne Plus Ultra, given me by Mr. Clarke of Studley Royal, proved also a good Strawberry this year, though not so highly flavoured as some. British Queen won't do with me, Dr. Hogg being much better. No Strawberry better repays care in a good strong soil than this. Can anyone who has tried Sir John Falstaff, Souvenir de Kieff, Princess of Wales, and La Grosse Sucre tell me what they think of them, and whether they would be likely to do in a light loamy soil not naturally a Strawberry soil? La Constante, so highly spoken of by some, is of little or no use here. For those who like Hautboy flavour Princess Dagmar is worth trying.

Referring again to mulching, I am quite confident that it

answers better to mulch Roses than to dig-in manure, and I think the same would apply to nearly all fruit trees, and have no doubt Mr. Luckhurst is right when he says the object is to get strong surface roots. Has Mr. Luckhurst remarked with me that Apples and Pears from trees where the ground is hoed or cultivated are better than those grown on trees where the grass is allowed, as in orchards, to grow up to the stems? and, moreover, that in equal periods of time, say ten years from planting, young trees on cultivated land will make double the progress as on grass? I can show some very marked instances of this. I should be glad if any of your readers would furnish notes of their experience with regard to new sorts, especially the seedlings raised by Dr. Roden and Dr. Nicolson.—O. P. P.

### SPECIAL GENERAL MEETING OF THE ROYAL HORTICULTURAL SOCIETY.

AUGUST 18TH.

LAST Friday afternoon a Special General Meeting of the Fellows of the Royal Horticultural Society was held in the Council-room, South Kensington. The object of the Meeting as advertised was "To receive from the Council a statement of the result of their negotiations with Her Majesty's Commissioners, and to consider and, if they shall approve, sanction the agreements provisionally entered into between the corporations." The chair was occupied by the Hon. and Rev. J. T. Boscawen, and at the Council Board with him were Vice-Admiral Hornby, Mr. William Haughton, Dr. Denny, Dr. Hogg (Secretary), Mr. W. B. Kelloock, Mr. A. Greta, Mr. Henry Webb (Treasurer). Amongst the general body of Fellows of the Society were Mr. S. H. Godson, Mr. Bateman, Mr. Guedalla, Mr. David Wooster, Mr. G. F. Wilson, Dr. Masters, Mr. H. Liggins, Mr. Shirley Hibberd, Mr. B. S. Williams, Mr. Maurice Young, Mr. Pinches, Mr. Bohn, Mr. Moore, Mr. Seal, Mr. Porter, &c. The attendance of the Fellows was by no means commensurate with the important character of the Meeting, which was, so to speak, to decide upon the very existence of the Royal Horticultural Society; but, as was explained in the course of the proceedings, the season of the year operated against the possibility of a full Meeting.

The CHAIRMAN said: Ladies and Gentlemen, I do not think it will be necessary to detain you long. All we have to do is to ask you to accept the Report which I will read to you, and afterwards I hope you will sanction the agreements we have provisionally entered into with Her Majesty's Commissioners. First of all I must read you a letter from our President, Lord Aberdare. The Chairman read the letter in which the noble Lord said he should not grudge the trouble of coming to London to attend the Meeting were it not that Lord Coleridge and other friends were to be with him on the 12th inst.; and he added, "The arrangements you have succeeded in making with Her Majesty's Commissioners are so advantageous that I cannot doubt they will recommend themselves to the members for adoption without any adverse discussion. I hope therefore you will be able to dispense with my attendance, the inconvenience of which at this moment would be very great." I will now read you the Report of the Council.

The following is the Report, which was taken as read:—

"The Council have the honour to report that they have succeeded in obtaining from Her Majesty's Commissioners terms which, if sanctioned by the General Meeting, will in their opinion free the Society from its present difficulties, and put it in a fair way to attain the high position which it ought to occupy as the foremost institution in this kingdom for the advancement of the science and art of horticulture. It is unhappily notorious that for some time past the action of the Society for good has been paralyzed by internal dissensions, and that in consequence of such dissensions its income has greatly fallen off. The Council are anxious to do full justice to all classes of the Fellows, the interests of which they think do not in reality conflict; and, whilst feeling strongly that the encouragement of horticulture ought to be their chief object, they believe that this will not be interfered with by making the South Kensington Gardens as attractive as possible to the inhabitants of London in general, and to the residents in their immediate neighbourhood in particular. By such a policy they hope, and as they think reasonably, to obtain for the Society an income sufficient to meet the requirements of Her Majesty's Commissioners and to place it on a satisfactory footing.

The present agreements between Her Majesty's Commissioners and the Society are so complicated that any attempt to deal with them otherwise than by way of modification was impossible in the time which the Council, without risking the very existence of the Society, could devote to the negotiation, and a question of some importance, involving the construction of these agreements, is still pending, but in, as the Council believe, in a fair way towards being settled amicably. The nature of this question is such that it is not possible to explain it within the limits of an ordinary report, but the Council refer to it here, inasmuch as it has necessitated the wording of the third clause of the proposed first agreement, which to those Fellows who are not intimately acquainted with the relations between the corporations may appear obscure. Two new agreements are proposed to be made between Her Majesty's Commissioners and the Society. The heads of the first are complete, and only await the sanction of the Fellows; those of the other the Council hope to be able to lay before them at the General Meeting.

By the first Her Majesty's Commissioners absolutely remit the payment of the £2400 rent now nearly due, and authorize the Society to borrow £7000 to pay its debts and repair its buildings; and if at the end of three years they shall exercise the power given to them by clause 2, they must take upon

themselves this £7000 of new debt, or so much of it as shall not have been repaid, out of what would have been their own rent.

"The Society's lease cannot in any case be forfeited before the end of the year 1876. It cannot be then forfeited unless the income of the Society for that year falls short of the amount required by clause 2. Even if such income should for that year fall short of that amount, there can be no forfeiture if the Society shall pay its rent in accordance with the present agreements; or if the Society shall next year, out of monies which it could tender as rent, reduce the new debt by £2400.

"By the second new agreement the Council hope to obtain part of the French annexe, the garden attached thereto, and a new entrance close to the Royal Albert Hall, in consideration of certain concessions in respect of the strip of land lying to the north-west of and outside the gardens, which they believe can be made without injury to the Society's property.

"The Council trust that these results will be deemed satisfactory, and they feel that it is the merest justice to state that but for the friendly feeling towards the Society of Her Majesty's Commissioners and the untiring personal exertions of General Scott to help them, they would have been unable to complete these arrangements in the very limited time at their disposal."

August 10th, 1876.

The Assistant Secretary then read the "Heads of Proposed new Agreement," which we published in our last number, and then the following:—

"PROPOSED SUPPLEMENTAL MODIFICATIONS OF THE AGREEMENTS BETWEEN THE COMMISSIONERS FOR THE EXHIBITION OF 1861 AND THE ROYAL HORTICULTURAL SOCIETY.

"1. The Commissioners will permit the Society during its present term to occupy and use that portion of the 'French Annexe' which on the plan (A) hereto is coloured red.

"2. The Society will permit the Commissioners during such term to occupy and use that portion of the same 'Annexe' which on the said plan (A) is coloured blue.

"3. The Commissioners may, when they please, put up a division or barriers between the said portions coloured red and blue.

"4. The Commissioners will permit the Society to occupy and use the garden, coloured green on the said plan (A), attached to the said 'Annexe,' the Society keeping the same in proper order, and the Commissioners to give six months' notice from any day of their intention to resume possession of it without compensation.

"5. The Society will permit the Commissioners to make, maintain, and control, subject to a right of way on the part of the Society, the road shown on plan (B) hereto and thereon coloured blue, and will also permit the Commissioners to remove the office marked (C) on the same plan of the Society's Superintendent of Shows, and to occupy and use to the absolute exclusion of the Society the land shown on the said plan and thereon crossed with black lines. The said road shall be so constructed as to ensure to the Society a sufficient and convenient access to the land lying between the north of the Gardens and the said road, and so as not to interfere seriously with the enjoyment of the house now occupied by Mr. Dick; or, if it is making such a road it should be found necessary or desirable so to interfere with the enjoyment of the said house, the Commissioners shall build another house equally convenient and suitable for the purposes for which the said house is now used, or shall make other sufficient compensation for the injury done thereto.

"6. The Commissioners will build and provide a convenient office and carpenter's shop in the positions marked on the said plan (B) with the words 'office' and 'carpenters' shop.'

"7. Subject to joint use with visitors to other parts of the Commissioners' estate, the Commissioners will permit the Society to use the orchard-house entrance at the north-east and north-west of the Gardens subject to six months' notice.

"8. Should the Commissioners desire to resume possession of the upper north-east and north-west Quadrant Arcades, they shall give six months' notice to the Society, and make reasonable compensation for any actual loss which may be sustained by the Society in the removal, or by the destruction of plants and fixtures.

"9. The Commissioners will give the Society an entrance on the north side of the Gardens close to the Royal Albert Hall, subject to the rights of the Hall.

"10. The Society will not raise any question as to the right of the Commissioners or their lessees to occupy and use any buildings or structures now occupied or used by them or their lessees, which are partly or wholly built or erected on or over the Society's land."

Mr. GURDALLA asked, What was the amount of the debenture debt?

Mr. HAUGHTON.—£50,000.

Mr. SHIRLEY HIBBERD.—The income is to be raised to £10,000—have you any plans to show in what way you propose so to raise the income? Let us see the plans, because it is impossible to understand the statements unless we see them [hear, hear].

The CHAIRMAN.—Mr. Haughton will show the plan. We have had no time at present to prepare elaborate plans or an elaborate scheme for the increase of our income. We have had but a very few weeks to come to terms with our landlords, and that, I think, is sufficient work to satisfy you at present [hear, hear]. Before Christmas we will be in a position to lay before you an elaborate scheme for the increase of our income.

Mr. HAUGHTON.—With respect to the plans, I may state the agreements were only settled the day before yesterday, so that it is impossible at this moment to have a number of plans ready. To have the agreements settled was the point upon which we really concentrated our energies. As to the question of time, I may say the first meeting of the sub-committee to confer with the Commissioners was held on the 18th of last month—this day month—and as we had to give a week's notice of meeting, I certainly think the Fellows have not much to complain of [applause].

Mr. SHIRLEY HIBBERD.—There is no objection whatever as to the hurried way in which the Meeting has been called, but I do not think we are to swallow down these agreements without

knowing what they really mean, and how you propose to carry them out [hear, hear].

Mr. HAUGHTON.—We will give every information that is required.

Mr. LIGGINS.—We have not had half an hour to look at some of these documents, and it is impossible in that time to give to them a calm and fair consideration. We have not had the plans at all to consider. We really have not, I may say, a quarter of an hour to look into these documents, and that is, I think, a reason why this Meeting should be adjourned [hear, and no]. I really put it to the Meeting whether the members of a Society which has on its roll thousands of members ought to be bound by the decision of a Meeting like this where hardly fifty Fellows are present? [hear, hear].

The CHAIRMAN.—I must say you are not in order. Mr. Hibberd has possession of the chair.

Mr. LIGGINS.—I beg to say that Mr. Hibberd has waived his right in favour of me. We all must know that this is really not a Meeting of the Society, which numbers thousands of persons who never heard—at least many never heard—of the propositions before us; and is a Meeting, moreover, in which a great number of us who compose it never knew anything of these propositions until we entered this room [hear, hear]. This Meeting does not consist of fifty persons, and I hope the representatives of the press will notice that fact. Is it reasonable that we should be called upon to confirm statements or agreements—call them what you like—which, to our surprise to-day, our so-called President has not had the opportunity of investigating? [cheers.] If these agreements were decided upon only the day before yesterday Lord Abderare must be as ignorant of their effect as we ourselves are. I think, under all the circumstances, we ought to adjourn the Meeting for six weeks [hear, hear, and no].

The CHAIRMAN.—I think if we adjourn the Meeting we shall not have as many Fellows present as we have now. Now, one word as regards time, which I look upon as an all-essential element in this matter. We all feel that unless we get into a position to pay our way we must fall to pieces [cheers]. But we wish to pay our debts, and to do that we must get money. It is really of vital importance that we should come to terms with our landlords in order to get that which we require [hear, hear]. As to the short notice, you have got the very same notice as you had with respect to the first agreement, and we thought we should save you trouble by taking the matter when it was thoroughly sifted, so that you might be more satisfied. We have laid that first agreement before you to-day to save another meeting.

Mr. SHIRLEY HIBBERD.—I rise, sir, to propose a resolution. I always try to do things in the ordinary manner [laughter]. My reason for submitting a resolution is that the case submitted to us now is of so indefinite a character so far as it appears advantageous to the Society, and so exceedingly definite where it appears disadvantageous to the Society, that we must really have time to consider it [hear, and cheers]. You may say we are in debt and difficulty; well, that is too well known—it is too notorious; but there is an old saying which it would be well to bear in mind, "Don't jump out of the frying-pan into the fire" [hear, and laughter]. Indeed, it seems to me if we accept these agreements without giving to them mature consideration we shall complete the ruin of the Society, which anyone of us can see is imminent. Let us not pull down this institution about our ears because it appears somewhat weak. I should think, as regards the immediate wants of the Council, that if an appeal were made to the Fellows in a thoroughly candid manner it would end in the realisation of some £4000 or £5000. I am prepared myself with a small subscription, and a gentleman who sits here on a former occasion made a most liberal offer, and is, I believe, prepared to carry it out. But I am not prepared, and I believe he is not prepared, to throw money into some promiscuous box hung up after some appeal is made to the Fellows [hear, hear]. You say this proposal laid before us is to redeem us from the difficulties under which we suffer. Well, I ask the Meeting to look into these proposals and see what they come to. Do the Commissioners take our debenture debt? No. Do they offer us any money payment? No. Forsooth, they give us permission to borrow £7000.

Mr. GURDALLA.—If you can.

Mr. SHIRLEY HIBBERD.—Oh, yes, and in three years—in fact, I was going to say that the agreement only delays for three years, the swallowing-up of the Society [hear, and cheers]. I am sure no one would like to see this Society in a state of insolvency; but, for my part, I should sooner see the Society in a state of bankruptcy than see it dragged through the mire week after week, as it is now being done, by asking us to sanction agreements we have not had time to consider. Here, indeed, is a case in which we are asked to partake of a cup of cold water not knowing whether there is poison in it or not. Look to the conditions of the agreements. The income of the Society is to be increased. That is the first proposal, but there is a condition hanging to it; it is not on the cards, but it is on the parch-

ment. Our representatives do not tell us how the income of the Society is to be increased. They do not tell us whether the country Fellows will or will not have ten times as much to pay as they have now to pay. I do not charge the Council with anything of that sort, but I put the matter in this way to show you that we ought to know what is intended to be done in the way of raising the income of the Society. Let us have a schedule which will give us that information. I have no doubt the Council and the Commissioners in what they are doing are acting for what they consider the best, but at the same time it is well that we, the Fellows, should see and know what is going to be done [hear, hear]. And for this reason, whatever we do now will bind the whole Society [hear, hear]. Now, I ask you to look at that clause in the agreements which says the Society shall not accept any more life compositions. Well, now, as far as that goes our charter might as well be torn up. No more life Fellows indeed, without the consent of the Commissioners! That is subjugation with a vengeance. Look again at clause 8, which reads thus: "Whilst the said clauses 6 and 7 remain in force the Society shall, on the authorised bank holidays, or on such other days not exceeding five in number in any one year as may be agreed upon by the Society and the Commissioners, admit the public to the South Kensington Gardens free, or at such charge as may be fixed by the Commissioners." Here, then, you are tied by the feet, and I can tell you, you will be tied by the neck presently [hear, hear]. The idea of asking us to give up our rights in this way is to me simply and perfectly ridiculous. It is not to be supposed that a body of men with ordinary intelligence will go blundering into business in this kind of way [hear, hear]. But, after all, how is it possible we can decide upon these propositions when we have not had them in our hands half an hour? Now just look at clause 5 of the "Proposed Supplemental Modification." It says, "The Society will permit the Commissioners to make, maintain, and control, subject to a right of way on the part of the Society, the road shown on plan (s), &c., and will also permit the Commissioners to remove the office marked (c) on the same plan of the Society's Superintendent of Shows, and to occupy and use to the absolute exclusion of the Society the land shown on the said plan, &c." Now, I object to that clause, as it shuts-up every mode of access for plants to our exhibitions [hear, hear].

Mr. HAUGHTON.—The clause is subject to a right of way.

Mr. SHIRLEY HIBBERD.—Well, perhaps so; but if you carry a road next to Mr. Dick's house it will be impossible for you to get plants into your exhibitions. Well, then, look at clause 10, which reads thus—"The Society will not raise any question as to the right of the Commissioners or their lessees to occupy and use any buildings or structures now occupied or used by them or their lessees which are partly or wholly built or erected on or over the Society's land." Well, do you understand what that comes to? I believe it is as great a mystery as ever came before any Society that we should give up all our rights, and that Her Majesty's Commissioners should go exactly where they please. Let them at once ask us to give up our garments and go through the world naked [cheers and laughter]. They will ask for our plants next; they will ask probably for everything exhibited on our premises; and I am really and sincerely surprised that a body of men, respectable and responsible no doubt, and powerful as they themselves feel, as the Commissioners are, should make such monstrous proposals to the Royal Horticultural Society, and expect that Society would accept or receive them [cheers]. It is with the utmost astonishment I see these proposals made. After all, I suppose two or three months must be expended in considering this matter [no, no]. I mean considering it properly [hear, hear]. Between poverty and disgrace there is a wide gulf. Well, let us bear poverty, for then we can still maintain our position—a position which is not as bad as it is represented, for after all a debt of a few thousand pounds is of very little consequence; but let us not, at all events, put up with disgrace [cheers]. One very great difficulty in our way undoubtedly is that Her Majesty's Commissioners are so exalted by the consciousness of their own strength and of our weakness, they imagine they can impose any terms, however humiliating, upon us [cheers]. I conclude by moving, "That this Meeting be adjourned for two months from the present time."

Mr. LIGGINS.—I beg to second the motion just made by my friend Mr. Shirley Hibberd; and in doing so I must say I am astonished that a Council not elected by ourselves, but rather nearly all of them appointed by each other, should come to us with such ridiculous propositions as those submitted to-day without having the courtesy of letting us know in proper time what they were [hear, hear]. They may be very good, but we have really no opportunity of knowing whether they are or not. I should be very sorry to give any vote to-day, because my Lord Aberdare says he hopes there will not be any opposition. That nobleman does not know the case himself. If he is the President of our Society, who appointed him? All I know of him is that he is a very able ex-minister of the Crown, and that he has, as we now discover, been pitchforked into this office of President

of the Royal Horticultural Society; that he has been appointed by a Council, by gentlemen who have done nothing but put forth this ridiculous scheme [cheers and laughter]. We would be stultifying ourselves and thousands of Fellows of the Society if we agreed to the proposals laid before us until we had proper time to consider and decide upon them [hear, hear]. Let this Meeting be adjourned until a larger number of Fellows come into it, and then it may be that "in a multitude of counsellors there is wisdom." Is there any imperative necessity for this good work being done so rapidly? Matters of this sort are generally arranged after mature consideration. We really have not the honour of knowing Lord Aberdare. He is a perfect stranger to us [hear, hear], and yet we are told from the chair that he is our President [a laugh], and that he writes a letter stating Lord Coleridge and his country friends are about to visit him and he can't come to you [laughter]; and that applies to the five hundred Fellows who usually fill this room, not to the miserable number now present. Well, what is good for them is good for the President: they are not here, he is not here, and so we must adjourn [hear, and a laugh]. If I understand the matter rightly we are very much indebted for these arrangements between the Royal Horticultural Society and the Royal Commissioners to His Royal Highness the Prince of Wales, because I see in the *Times*—no mean authority—that the Prince of Wales presided at Marlborough House over a joint meeting of the Commissioners and of the Council of the Society.

The CHAIRMAN.—The Meeting was one of the Commissioners solely.

Mr. LIGGINS.—Well, however it may have been, I find that Major-General Scott has got the whole credit for whatever has been done [loud cries of "oh"], but it should be remembered that the very same Major-General Scott and Sir Henry Cole were always opposed to the interests of the Society, and turned out a good Council.

The CHAIRMAN.—The question, sir.

Mr. LIGGINS.—It is the question. It is the merest justice to state that friendly feelings to this Society were expressed by General Scott; but at the same time I am sure we are all glad that we have nothing to do with him or with Sir Henry Cole. It was the policy of these gentlemen which brought the Society to its present position [cheers]. Now look at the Council sitting at that board. They are all elected by each other—they are not elected by the Society at large. We really did not know who was the President of the Society. I heard a whisper that Lord Aberdare was to be the President, and it was very likely he was as good a man as could be got in England [cheers]. But nine out of ten gentlemen here were not aware that Lord Aberdare was our President. Is it, under these circumstances, just that we should pledge ourselves to any arrangements so loosely placed before us, and especially when those arrangements were extremely beneficial to Her Majesty's Commissioners? I do not think we have anything to do with the Commissioners but pay them what is justly due to them [hear, hear]. I believe that all legal complications respecting legal documents will be a curse to the Society. At all events, I am quite sure that what takes place to-day will not give confidence to the public at large, or induce those to subscribe who might be inclined to help us out of our difficulties. But will they do so when they find such complicated terms have been placed before us, and that we have not got time to consider them? I do not blame these gentlemen who have prepared these plans, because I am sure they have worked very hard to get the business into ship-shape for to-day [hear, hear]. But that is not a reason why we should be satisfied. We have not had a reasonable time to consider whether we should adopt these agreements or not, and as men of intelligence and men of business our only alternative is to adjourn the Meeting to a future day [hear, hear]. I beg to second the resolution.

Mr. GURDALL.—Although I agree with very much of what has been said by the two last speakers, yet I do not fall in with all their remarks, for I looked upon the appointment of the Council as a *fait accompli* [hear, hear], and for my part I shall give the Council every support. Still, at our last meeting a new member of the Council held out to us that he had a plan out and dry for the rescue of the Society from its difficulties, and that the Council would come down to-day and submit the plan to us. I may remark you have not stated the rights you have acquired by the agreements. We are all aware you cannot obtain a much larger income than you have without resorting to artificial schemes such as that of the skating rink. I think you have rashly entered into some arrangements or agreements by which you intend to raise your income to £10,000 a-year. For my own part I do not see how that is to be accomplished. I must say I do not hold with the remarks made against General Scott, because I am sure he deserves our thanks [hear]. I did not believe in him having a seat at the Council because I felt we were in a state of dependence while he was there. It is all very well to talk about getting £7000, but I am sure unless you have some tangible security it will be a difficult matter to get it.

Admiral HORNBY.—I wish to say I did not state at the last

meeting that I should be prepared to-day with a cut-and-dry plan to show how our income might be raised to £10,000. Still, I believe it can be raised to that amount.

Mr. GURDALLA.—Will you be good enough to say if you have any hope of raising the £7000?

Admiral HORNBY.—I can tell you this, that a gentleman present has offered to lend us £5000 [applause].

Mr. GURDALLA.—I am sure we are all very glad to hear that, for I do not like underhand dealings. I like plans and arrangements which everyone can comprehend.

The CHAIRMAN.—Be good enough to keep to the agreements.

Mr. GURDALLA was understood to say he should support them.

Mr. BOHN remarked that he was on the Committee when the £50,000 was raised. He opposed the raising of it, but Dr. Lindley, Sir H. Cole, and others carried the day, so that £50,000 had been the source of all their misfortunes [hear, hear]. When they had Ohiswick gardens they did not owe £10,000. He had offered to keep the gardens for £100 a month and make them successful. But the Society had encountered every opposition at the hands of the Commissioners [hear, hear], and at last they had £50,000 tacked on to them. As to raising money on the security of the Society, as it at present stood he very much doubted it could be done. He would lend the Society £10,000 to-morrow if they gave him security, but he did not like the security they offered at present. Having commented on the way in which the forty-guinea subscribers, of whom he was one, had been treated, Mr. Bohn said the Society had got into that position that they were little else than the vassals of the Exhibition Commissioners, and, for himself, he should not vote one way or the other. He was sorry that by a little mutual giving way much more had not been done for the interests of the Society [hear, hear].

The CHAIRMAN.—I can assure you we shall take the case of the forty-guinea subscribers into consideration in laying our scheme before you.

Mr. PINCHES.—There are two propositions before us—the first is that of adjournment because of the insufficient number of Fellows attending the Meeting, and the second is that the Meeting should be adjourned because the agreements have not been a sufficient length of time in our hands. I think on the first ground it would be idle to support the adjournment of the Meeting. I am aware London is thinning rapidly, and no part of it more than that in which we are (South Kensington), and I am afraid if we adjourn the Meeting for two months, instead of having fifty Fellows we should not have five [hear, hear]. Upon that ground I shall not vote for adjournment. On the other hand I think gentlemen have much underrated the opportunities they have had of looking into these agreements. I really think with forty-eight hours before us it was quite possible to master these documents [hear, hear], and to come sufficiently near to the gist of the whole case [hear, hear]. In considering this question, I think we very often lose sight of the peculiar position in which the Commissioners stand. However much they may feel disposed to help the Society out of its difficulties, they are after all dealing with a trust fund [hear, hear]. Taking all these circumstances into account, and being very much better acquainted, by going through very voluminous documents, with the relative positions of the two bodies than most of the Fellows, I am very much inclined to think, however much you may wriggle and distort yourself, and feel unutterable anguish at your position [laughter], you can't wriggle yourself out of it [hear, and renewed laughter]. We have got into a mess, how can we get out of it? [hear, hear]. Fifteen or sixteen years ago you made a most unfortunate bargain, which in commercial circles was without a precedent. A sum of £50,000 was placed upon a lease of twenty-one years which may be forfeited at any moment, and I understand the Commissioners repudiate any responsibility in regard to it.

Mr. HAUGHTON.—They are bound to take the responsibility of half of it if they do not renew our lease—responsibility, say, to the amount of £30,000.

Mr. PINCHES.—Well, we said we should pay the rental, but we have not paid more than twice; and if we do not pay it next year our lease is forfeited. How can we pay it? We can't pay our prizes, and how can we pay £2400 rent? That being our position, what is the use in talking of trifles? [hear, hear]. I say, cast the Commissioners overboard if you can and float the Society by yourselves; but, looking into the relations between yourselves and the Commissioners I say such a thing is impossible, and that, whether you like it or not, you are bound in a sort of partnership. How are we to raise the £7000? It is certainly very pleasing to hear that £5000 is to be lent us by a gentleman.

Mr. BOHN.—On interest.

Mr. PINCHES.—And on some security.

Admiral HORNBY.—I shall explain.

Mr. PINCHES.—In any case our rent is not paid. How can we pay it? The gentlemen who moved and seconded the motion for adjournment appear very uneasy about that second paper, but it really seems to me to refer to details which are of no real

moment. It is a sort of mutual accommodation—not, I hope, on the Collie system [a laugh], and one that, I think, will tend to the favourable working of the Society. Then comes the question, Can we raise our income to £10,000? I think by raising the subscriptions to two guineas or three, and in other ways it can be done. I think on the whole the terms come to be favourable. We are not in a position to dictate terms to the Commissioners, and I don't think we can do better than accept those we have now obtained [hear, hear].

Dr. MASTERS expressed his unqualified disappointment at the Report presented to the Fellows by the Council. It was no doubt a fact that they could not wriggle out of their engagements with Her Majesty's Commissioners. They were all, unfortunately, too well aware of that. It was all very well to have a dog tied-up and a collar put upon his neck, but in this case, taking the Society as the animal, handcuffs, chains, and every conceivable kind of restrictive instruments were put upon him, so that the unfortunate dog couldn't even wag his tail [laughter]. Under the tenth clause the Society could not get a housemaid to dust their windows, to sweep-out their premises, or, in fact, do a single thing [hear, hear].

Mr. HAUGHTON thought there was some misapprehension as to the tenth clause. It so happened an agreement was entered into some time ago between the two corporations. The Commissioners had erected the towers over the orchard house, also some buildings of minor importance, and one also of great importance—the communication between the Royal Albert Hall and the upper part of the conservatory. These they had always the use of, and it would be exceedingly dishonest in the Society to interfere with the enjoyment of them by the Commissioners now [hear, hear]. The clause was simply to secure the Commissioners in the right of enjoyment of those structures.

Dr. MASTERS.—I accept your explanation, I am bound to do so, but your explanation shows the necessity of adjourning the Meeting [hear, hear]. That clause may alter the complexion of the whole thing.

Mr. HAUGHTON.—We will be most happy to give any explanation, but we wish every Fellow who likes to do so to express his opinion.

Dr. MASTERS.—Well, I have expressed my objection.

Mr. PORTER was understood to object to the admission of the public free to the gardens.

Mr. BATEMAN thought it would be well if some of the gentlemen who were disposed to criticise the acts of the Council remembered that neither the present nor the last Council nor the Council before that were in any way responsible for the arrangements which had led to all these difficulties [hear, hear]. If that were only borne in mind all acerbity and hard words would be felt to be out of place there. Looking at the reports of their recent Meetings, he could speak positively that they had acted very injuriously on the prospects of the Society [hear, hear]. People hesitated to join a Society which was in such a state of chronic commotion. He did not think any mere legal instruments would effectually help the Society out of its difficulties. As the late Lord Derby said with respect to the National Gallery dispute—that the worst decision was better than no decision at all; and so, although there were some matters in the agreements he did not like, it was, he thought, better to adopt them than adjourn the Meeting for two months. If they adjourned at all it should be for three months. He decidedly thought, from personal knowledge, that the constitution of the present Council had the right ring in it. They must not criticise too closely the terms of the agreements—indeed he could get over any but the tenth clause. He did not understand it, and before they were called upon to agree to it they ought to have a schedule attached so that they might know where they stood. With the exception of the tenth clause he should be prepared to give his assent to the arrangements come to with Her Majesty's Commissioners [hear, hear]. He did not believe there was any definite motion before the Meeting.

Mr. HIBBERD.—Oh, indeed there is.

The CHAIRMAN.—Yes, there is a motion for adjournment of the Meeting.

Mr. DAVID WOOSTER referred to the sixth clause—viz., "The Society shall not accept any more life compositions without the written consent of the Commissioners." Mr. Wooster said he was under the impression that there was a clause in the Charter which required the Council to set aside a certain portion of the life compositions to form a sinking fund for the ultimate redemption of the debenture debt [hear, hear]. There was another clause which enjoined the Council to reserve three-fifths of the earnings of the gardens after legitimate expenses were paid. Now, in common justice to the debenture holders, if that clause remained could they enter into an agreement to that effect? He had seen with great regret some of the acts of the Commissioners with respect to the Council. The access to the offices had been cut off, the room in which they were then met was a common passage room, and they could not hear. He wished to know whether the Commissioners had any right to the upper arcades on the north-east and north-west part of the

gardens. What had become of the magnificent tent which was the property of the Society? It was, he thought, of the utmost importance the Society should not get into any further difficulties, but smooth over those which at present existed.

The CHAIRMAN said he believed no compensation was paid by the Commissioners for the tent, but the Society used the canvas.

Mr. S. H. GODSON insisted that the accounts should be thoroughly sifted, and he had no hesitation in saying if they were, instead of having to borrow £7000, they would have in hand at the present moment more than that amount [hear, hear]. Plenty of dust had been thrown in their eyes from time to time, and he was not surprised that gentlemen were afraid of coming to that Society. He was satisfied, however, that if right took place the Society would be as solvent as any merchant in the city of London. He should suggest an adjournment for three months.

The CHAIRMAN observed that they owed £150 for prizes and £950 amount of interest on debenture debt due in August.

Mr. SMILEY HARRISON and Mr. LIGGINS said they were in favour of Mr. Godson's suggestion for a three months adjournment.

Mr. BORN asked, What had become of the Society's property? What about the arcades?

Mr. HAUGHTON said they were built by the Commissioners, but the Society had a right of way, and the Commissioners proposed to let the Society have possession of them as long as the Commissioners did not themselves require them. They were constructed by the Commissioners with the permission of the Society, and the latter was allowed to retain the use of them so long as the Commissioners did not require them. The upper arcades belonged to the Society. He might say that their rights with regard to passage through the lower arcades under the old agreement were not in any way touched. As to the life compositions, the Council felt that life compositions were a continual temptation to improper dealings. These life compositions which ought to amount to a considerable sum were now non-existent. The Council wished to protect the Society from the confusion created by the life compositions. The clause on this point was one the Commissioners would not insist upon, but it was the unanimous wish of the Council that it should be agreed to. He was sorry to say the finances of the Society were in a deplorable condition. They were obliged to wash their dirty linen in public, but the Council felt they ought not to ask the indulgence of the Fellows because they had done nothing to bring about these difficulties—they came to them as an inheritance, and he might say the Council had worked hard during the last month to get the Society out of its difficulties.

Mr. LIGGINS asked, whether it was not by the Council on which General Scott and Sir Henry Cole were sitting the life-composition money was first misappropriated?

Mr. HAUGHTON said the question was rather irrelevant, but he should be happy to answer it if he could. The Society, at the present moment was in great financial embarrassment. They had not paid their debenture interest, and the money in hand was insufficient for the purpose. The Council felt they ought not allow the time to pass over without setting their house in order. The agreements give them three years—take the matter as they liked—to do that, and by that time they would not put anyone in a worse position than before, except, indeed, the Commissioners.

Mr. GODSON.—And the debenture holders.

Mr. HAUGHTON.—No, but I will come to that. The arrangement will save off the forfeiture which was staring them in the face—a forfeiture which would involve the actual confiscation of this interest of the debenture holders. It would enable them to pay every farthing they owed except the debenture debt, and, at the end of three years, if the Commissioners put an end to the agreement, they must take the Society's debt on their own shoulders. He had the fullest confidence in the friendly intentions of the Commissioners towards the Society. The Commissioners had shown it in their negotiations with the Council [hear, hear]; and certainly without the great personal exertions of General Scott in the interests of the Society the Council could not that day have presented the agreements to the Meeting [cheers]. The consideration of time alone seemed conclusive against the motion for adjournment. He would remind the Fellows that as time had been going on the Society had been getting worse terms. As to the bank holidays, he might remark at present on certain days the public were admitted to the gardens at a charge of 2d. The Commissioners gave the Society their credit, took the responsibility of the new debt, waived the forfeiture, and made the Society a present of the £2400 due next year. In return for that what did the Commissioners ask? That the Society should admit the public on bank holidays, as they were now admitted, at a charge of 2d., or "at such charge as shall be approved by the Commissioners." The Commissioners believed a charge ought to be fixed so as to prevent injury to the gardens. Then with respect to the agreement as to the access; it should be borne in mind that by the existing agreement the Commissioners had a right to stop-up

that way from Kensington Gore, and to give the Society another mode of access, and to stop it up and give a fresh one from time to time as they pleased. That being so, the Society would be better off under the new than under the existing agreement. As regarded the tenth clause, the Commissioners would not have a right to go anywhere where they were not at present. They had got the places referred to at present, and had a moral right to enter them. They had been asked why they did not pay the Commissioners. Well, after what had passed in that room on recent occasions it appeared to him that question must not have been seriously put, but put to place the Council in a state of embarrassment [hear, hear]. Every Fellow knew there was not the slightest hope of paying the Commissioners the £2400 next year, and that if it was not paid there would be forfeiture, which meant the destruction of the Society. He might remind the Fellows that before the Society came to the South Kensington Gardens its income from subscriptions never reached £3000.

Mr. BORN.—That was at Chiswick?

Mr. HAUGHTON.—Yes.

Mr. BORN.—We did not want it.

Mr. HAUGHTON.—The South Kensington Gardens bring us in a larger income than they take out of our pockets.

Mr. LIGGINS.—That must be a mistake; if it were so we should not be in difficulties.

Mr. HAUGHTON went on to say a fine room had been provided for the Council and members.

Mr. PINCHAS then moved, "That the Reports and Agreements laid before the Meeting be approved and sanctioned."

Mr. BARTMAN seconded the motion.

The CHAIRMAN then put the motion for adjournment as an amendment to that for the adoption of the Reports and approval of the Agreements.

The amendment was lost, nine hands having been raised for it.

Mr. GODSON said he should like to move another amendment to the effect that the Council be requested to issue a circular to all the Fellows asking for contributions towards next year's rent. He was prepared to give £25, and a friend of his would give at least £25.

The CHAIRMAN.—Do I understand you to mean that we should send a begging letter to each Fellow?

Mr. GODSON said he meant a circular asking for contributions.

Admiral HOSWY thought their position was very disgraceful, as they were liable to be put into the County Court for a few pounds; but would they be putting themselves in a better position by sending round what the Chairman characterized as a "begging letter?"

Mr. LIGGINS thought it would be well if a circular was sent to the Fellows with respect to their subscriptions, which he believed fell due in January. Last January 1200 subscriptions were not paid. He should hope that in the coming year that the disunions which had become necessary would be matters of the past [hear, hear]. They must put their shoulders to the wheel to bring the Society round and get the amount of money they required.

The motion for the adoption of the Report and agreements was then put and carried with two dissentients.

Admiral HOSWY said that in the early part of the proceedings allusion had been made to the fact that one of the lately-joined members of Council said he had a scheme for raising the subscriptions. Now, he might say he thought some of the Fellows appeared to be a little hard upon the new Council. The members did not come upon it for their own pleasure, but with the honest wish to keep these gardens for the Royal Horticultural Society. He could say the Council had worked hard to bring about the arrangements with the Commissioners, and he meant so long as he had a seat at the Council-board to do his best for the Society. He had looked into the question of how the position of the Society could be raised, and he felt sure if a proper appeal was made, especially to the people of the neighbourhood, and proper regulations were made, a large sum of money would be got together. He looked upon the transfer-ticket system as very objectionable. He was a holder of a four-guinea ticket, which is generally in the drawer of his hall table, and no less than five families called and made use of it [laughter]. He had taken the trouble of looking into the Court Guide, and found that in Prince's Gate and Prince's Gardens about a hundred houses did not subscribe to the Society, and yet the children and the nurserymaids from these very houses used the gardens [hear, hear]. His idea was to raise the money by not pressing too hard on people. They had to consider the rights of those Fellows who had bought life compositions. They must deal fairly with these gentlemen. His own impression was it would be a far fairer and better way that a Fellow should pay two guineas a-year to admit him to the gardens, the shows, and everything else, but that he should not bring other people with his ticket. If he had a small family, say only his wife and himself, let his wife become a Fellow like himself. But if a man had, say, three daughters, let that gentleman pay four or five guineas a-year for a "house ticket" [hear, hear]. If he was told that was too high, he answered that people who lived in

squares paid four or five guineas for a "house ticket," and had not the advantages of conservatories, covered arcades, shows, reading-rooms, and bands. Another idea was that all gentlemen's gardeners who held certificates from their masters to become associates at a guinea a-year to admit them to the shows, and in that way the Society would get some £500 or £600. If they had four thousand Fellows at two guineas, and four hundred "house tickets" at five guineas, they would have more than the £10,000. As he had been taunted with having a scheme, it would not be a bad thing to tell them what it was, whether bad or good. Accordingly, when we have a scheme out and dry we will send a circular to all the Fellows, get them distributed amongst all seedsmen, and call upon the good people of Kensington, if they value our gardens, to put their hands in their pockets and pay for them [applause]. He was sure if the gardens were done away with the value of property in the neighbourhood would be very seriously depreciated, and the enjoyment of the people much interfered with. He believed if the whole thing was done fairly, regard being had to the vested rights of everyone, and if they did their best to enlarge the sphere of the horticultural gardens they would be supported [cheers]. He should gratefully receive any suggestions, which he would put before the Council. For many years the Society had been living up to what would be to any of them ruin—expending in 1875 what they expected to get in 1876 [cries of "hear!"]. They would be able to borrow £5000 by the liberality of Mr. Frenke, who was willing to accept the security of the Commissioners [cheers]. Mr. Frenke said he was delighted to do it. Now these wretched prizes of 1874 were not paid; the 1875 prizes were paid, and this was what had caused the action. As to the hurried way in which this Meeting was called, he might say it had not been so called they could not have got the sanction of the Meeting to the agreements, by which, at all events, they would be able to borrow £5000 and free themselves from the debt of £1900, which was a stain and a stigma upon the Royal Horticultural Society [applause].

The CHAIRMAN said he was very glad to hear so good a scheme. Mr. FRENKE asked, Would it be promulgated before Christmas?

Admiral HORNBY.—As soon as I get the consent of the Council I shall issue a circular stating the whole scheme.

On the motion of Mr. LOGGINS a vote of thanks was accorded to the Council for the excellent explanations that had been given.

The CHAIRMAN, in acknowledging the vote, said all the hard-work had been done by Mr. Houghton.

The proceedings then terminated.

## RED, WHITE, AND BLUE.

DELICATE shades of these colours are well exemplified in three flowers that are now in bloom—viz., *Phlox amabilis*, *Yucca filamentosa*, and *Delphinium Bella Donna*. The latter possesses a beautiful pale blue colour that few plants can rival, perhaps something of the same shade as the pretty little annual *Nemophila insignis*. *D. pulchellum* is another beautiful variety of something the same shade, only tinged with pink and mauve, which detracts from the purity of the blue as seen in the first-mentioned; but as it has a stronger habit and is a free bloomer, it well deserves classing with the unsurpassed *D. Bella Donna*. These plants will bloom from June to September if some of their shoots are pinched off when in their young growth. Also as soon as a stalk has bloomed it should be cut away, others will then throw-up from the crown. When the shoots are in a young and pliable state a system of pegging-down can be resorted to, thus causing the flowers to be produced the height of Geraniums and other bedding plants. Indeed, when managed rightly it is at home either in the border, in isolation on a grass plot, or mixed with other plants.

I do not know a more suitable contrast for planting near it than the *Yucca filamentosa*, as this variety blooms more frequently than its fellows with grander foliage; but, again, it is more particular as to the soil. I cannot understand why a plant so beautiful and one so moderate in price should seldom be seen in gardens. What can be more elegant and yet stately than its flowering spikes, growing to a height of 5 or 6 feet with a wax-like appearance, which are beautiful at all times, perhaps mostly so in the evening and twilight, when through the subdued light they appear more than ever to stand-out in their purity, and emit a delicious Magnolia-like scent? Their delicate bell-shaped flowers invite a close examination, for there is not the crush of blossoms one generally sees in the *Y. gloriosa* and *recurva* which bloom at uncertain intervals of years, when the idea might strike one that the blossoms of several years have been condensed into one, the stalk being

so crowded with bells that the individual beauty is thus in a great measure lost. Like all other flowers with characteristic foliage, *Yuccas* look best either massed, isolated, or in a line—anything rather than the system of dotting.

*Phlox amabilis* blooming at the same time is a valuable addition to the others, its salmon-cerise colour being also strikingly delicate. When seen in company with the *Yucca* and *Delphinium* it completes a perfect trio. Thus we have in bloom together three flowers most delicately lovely, attractive, and perfectly hardy, and these are only three of those hardy gems that should be the prominent features of all gardens.—HENRY COOPER.

## ROYAL HORTICULTURAL SOCIETY.

AUGUST 18TH.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. The subjects submitted to the Meeting were not numerous. Mr. TILNEY, gardener to the Duke of Portland, Welbeck, sent a seedling *Nectarine Welbeck Seedling*. It has been raised from *Bruno*, and has considerable resemblance to that variety, except that the fruit is darker at the stone and more highly coloured in the skin. The fruit was not in condition to judge of the flavour. Mr. W. PAUL of Waltham Cross Nurseries sent a collection of fruit, including an *Early Pear*—the name was not determined, it resembled *Beurré Giffard*; a dish of *Oullin's Golden Gage Plum*; nine dishes of Apples, comprising very fine specimens of *Duchess of Oldenburgh*, an excellent cooking and dessert Apple; *Irish Peach*, a very fine dessert Apple; *Summer Golden Pippin*; *Lord Suffield*, a fine culinary Apple; *Thorn*; *Olin* and *Kerry Pippin*; *Early Julien*; and *Sugarloaf Pippin*, excellent for culinary purposes. A vote of thanks was awarded for the collection. A scarlet-flesh Melon named *Champion* of England was sent by Mr. J. ANDERSEN, gardener to W. Hutton, Esq., Kidderminster. It resembled *Little Heath*, being rather more deeply ribbed; flavour indifferent. Mr. W. FORGE, Walkergate, Beverley, sent a green-fleshed Melon, inferior to *Victory* of Bath.

Mr. B. DEAN, Ealing, sent a Japanese Radish, distinct from the Californian. The Committee referred it to Chiswick for trial.

FLORAL COMMITTEE.—Dr. Denny in the chair. Only a limited number of plants were exhibited in the Council-room, but the few were distinct. A first-class certificate was awarded to Messrs. James Veitch & Sons for a remarkable Fern, *Adiantum Luddemannianum*, in which the pinnae are metamorphosed at the extremity of each frond in a not more curious than constant manner, every frond being surmounted, as it were, with clusters of green florets. It is a remarkable and distinct plant, and totally unlike any other *Adiantum*. They had also a like award for *Macleodella Davisi*, a species with bright yellow flowers; it is exceedingly floriferous, the small plant exhibited having over twenty flowers, small, but literally as "bright as a Buttercup." The species is thoroughly distinct, and is likely to become popular. They had also *Artocarpus laciniatus* metallicus, a plant with large Vine-like lacinated foliage of a dark bronzy colour. If it proves adaptable for sub-tropical gardening it will be an acquisition; a second-class certificate was awarded. They had also *Artocarpus laciniatus* and *Oreton Lord Cairns*, green with yellow midribs, and in form not unlike the *Platynerium*; also an Australian plant, *Orotolaria Cunninghamii*, with white tomentose foliage and a crimson Pea-like flower. It is not unlikely that this may prove an effective white-edging plant. A botanical certificate was awarded.

Mr. BELL had a second-class certificate for *Artocarpus Osmundifolius*, a plant having larger also darker foliage than *A. laciniatus*. The upper surface of the foliage is in colour not unlike the *Perilla*, the leaves underneath being reddish brown. For indoor decorative purposes this is an effective plant, and if sufficiently hardy for the sub-tropical garden it will be a valuable introduction; it fully merited the award. Mr. BULL sent also a collection of *Boheverias* in variety and plants of *Lilium tigrinum*. *Oleanthus Dampieri* var. "*Deutsche Flagge*," was exhibited by Mr. Louis Viewig, Wegeleben, Emdenburgh, Prussia. It is a very robust variety, and was awarded a vote of thanks. A plant of *Sedum populifolium* was exhibited by Mr. Seale, 6, Friar Place, Albion Road, Hammersmith. It is a suffrutescent plant with pinkish white sweet-scented flowers. It is well adapted for the rockery, or as a vase or basket plant. It was introduced from Siberia in 1780. A small plant of *Odontoglossum Luddemannianum* was sent by J. S. LAW, Esq., South Lodge, Southgate. A spike of a seedling *Amaryllis* of the *Belladonna* type, with fourteen beautiful rosy flowers, was exhibited by Mr. BOWLING, gardener to Sir H. W. Parker, Richmond; it is a very fine variety.

Twelve varieties of *Verbenas* were sent by Mr. Eckford, gardener to the Earl of Radnor, Colehill House. The trusses and pipes were very large, and the colours distinct, embracing scarlet, purple, rose, and white. First-class certificates were awarded to *George Brunning*, purple with white eye; and *The King*, rich

rosy pink. Mr. Turner, Slough, exhibited a box of twenty-four very fine varieties of Verbenas, also bouquet Dahlia Triumph, a red variety of faultless shape; and Roses Rev. J. B. Camm, one of the most sweetly scented of all Roses, and of good form—it is of a full rose colour, and the perfume is that of the old Cabbage Rose; and Miss Hassard, a variety somewhat resembling Marguerite de St. Amand. Mr. Reed, gardener to J. H. Johnson, Esq., Mountains, Tonbridge, exhibited flowers of a buff seedling Carnation. Mr. G. Smith, Hedge Farm, Edmonton, exhibited blooms of a seedling Dahlia Bridesmaid. It is a delicate lavender-tinted flower of considerable promise, but the blooms sent were not quite perfect. Mr. Smith, Hornsey Road, Islington, had blooms of his new sport from the well-known Pelargonium Vesuvius. The blooms are semi-double, and the trusses are as freely produced as those of the normal variety. It has had a first-class certificate awarded, and will become a favourite for market and bedding purposes. From Mr. E. Dean, Ealing, came a plant of *Phlox Drummondii splendens grandiflora*, a rich crimson-scarlet variety with a white eye and very effective; also out blooms of dwarf *Tropaeolum* in four varieties of *T. compactum*—viz., Lustrous, scarlet; *Coccineum*, scarlet; *Aureum floribundum*, yellow; and *Carminatum*, carmine, all useful for bedding purposes. Foliage of a Golden Poplar came from Mr. Parker, Tooting, the variegation being very bright. It is a variegated form of *Populus angulata*.

The condolences of the Committee were expressed towards the friends of Mr. Taylor, of the well-known firm of Messrs. Webber and Co., fruiterers of Covent Garden Market, whose death was announced. Mr. Taylor was a member of the old Pomological Society, and subsequently of the Fruit Committee. He was a first-rate judge of fruit, and an estimable man. We join in the expressions of regret at his sudden demise. He was seized with paralysis a week ago, and never rallied.

### EARLY YORK AND EARLY ALFRED PEACHES.

I HAVE always been led to believe that Early Alfred Peach is far superior in all respects to any of our previous early varieties. I had not before this season a proper opportunity of testing its merits in this respect, but this year I have a tree of each of the above-named varieties growing close together, and of the same age. Now, if anyone were placed in front of them they would have no hesitation in saying from their appearance that they are the same variety of Peach.

The Early Alfred has disappointed me, for the old Early York still keeps in the ascendant.

I gathered my first fruit from Early York on the 4th inst., and to all appearance the Early Alfred will not be ripe for another fortnight; but then it will come with all due honours, for it is a good and noble Peach; a most worthy second. A wide gap will take place after them before any of the other varieties are ripe.

We have an exceptionally good crop of Peaches and Nectarines. We have had to thin out hundreds; I believe every blossom set its fruit.

Of all Nectarines let me bear my testimony in favour of Lord Napier. It is far in advance of all others. I find it the hardiest, setting its fruit when most others fail, the most prolific, and by far the largest and handsomest Nectarine in cultivation. May the Rivers long continue to nourish many more such Nectarines as Lord Napier is the wish of—JOHN TAYLOR, *The Gardens, Hardwicke Grange, Shrewsbury.*

### SUMMER PRUNING.—No. 3.

PLUMS require to be gone over at the end of June or early in July; those against walls being earlier than those in the open. The *modus operandi* is the same as in that recommended for the Cherry, therefore it need not be repeated here; the only difference is in the small twiggy shoots, which do not grow more than 3 or 4 inches in length. These, if on the side of the branches, should not be shortened, but left their full length; but if forerights or uprights, in the case of pyramid or bush trees, should be cut back to two leaves. The short shoots will mostly form fruit buds at every leaf, and have wood buds at the base of the shoots or at their points. To pinch-off such shoots at the third leaf is to leave them with no means of support for the young fruit; and though they may attain to the half swelling, yet they generally drop, and the shoots die back to the base. The non-stopping of such shoots causes the trees to be full of wood, but that may be put right by shortening these spur-like growths at the winter pruning, encouraging those close to the branches.

Plum trees, in fact, without the shortening and reducing of twiggy growths soon become crowded with them, and this should be obviated by judicious thinning and shortening in winter.

Pears at the middle of July in the north, and earlier in the south, require to have the shoots stopped. I stop all the side shoots to two leaves and the forerights to one leaf; this keeps them very near home, and admits of light and air being freely admitted to the spurs. The close stopping tends to the formation of spurs in a much higher degree than when the shoots are left with three or more leaves, the last entailing considerable work for the knife at the winter pruning, and its application resulting in strong growths the following year—equally barren of spurs as their predecessors. Succeeding growths are stopped to one leaf, and this renders winter pruning unnecessary. The extensions are trained in their full length, and if the space is covered, close stopping is practised throughout.

Pyramids and bushes are stopped in the same way, the branches being kept as near as may be 1 foot distance apart, their extension stopped at the sixth leaf, and the leading one of a pyramid at 12 inches of growth. All other shoots to be stopped to two leaves, and afterwards to one throughout the season. N.B.—Pyramid and bush Pear trees not unfrequently have short stubby shoots of 2 or 3 inches in length, with the leaves very close together and numerous, their points as well as the next two buds being also fruit buds. Such shoots are not to be stopped, but left entire, as they will in all probability carry fruit the following year, and in the autumn thereof they may be cut-in to the spurs which will have formed at their base.

Apples require to be treated after the manner of Pears, but are rather later; therefore I need not make any remarks upon them.

I now come to the Peach and Nectarine, and I might as well make a clean breast of it by stating that I am no advocate for the stopping the shoots of those trees. Beyond disbudding, which can hardly be termed summer pruning, the shoots require to be laid-in their full length, unless exceedingly vigorous and prone to put out laterals. Lateral growth is of no use, and is best removed; and stopping only tends, with me, to cause many eyes to start, which without the stopping it is only reasonable to conclude would form fruit buds.

Stopping may answer for growths of 14 inches or more in length when we can—at least, those with only moderate experience may make sure of doing it—stop at a wood bud, for then we are certain of wood buds even should laterals result from the stopping at the upper part or extremity of the shoot, as any lateral growth may be stopped at the first leaf; but should we stop a shoot, especially a weak one, midway of a foot growth, it may follow that its only wood bud may be at its extremity (those at the base being of no use to fruit above them), and the fruit setting upon such a shoot will, for want of leaves beyond to draw and elaborate the sap, drop off. When the shoots have leaves mainly of a triple-bud-forming character stopping may, of course, be practised, but unless the trees are in a gross state the stopping is neither necessary nor desirable. Short-pruning is all very well when command is had of the roots, and fruit is sought from short shoots and spurs, but for trees against walls, or on trellises under glass, I see no cause to depart from the long pruning as it is called, but much every way to recommend its continuance.—G. ASHBY.

### MR. JAMES BUTCHER.

To those of us who can look back to bygone days when florists' flowers held their heads high in the metropolis, and the "Horns" at Kennington and the Surrey Gardens were the meeting places of those who fondly loved and tenderly cared for them, the name of James Butcher was well known. He was one of the old school of florists, to whom the quality of a flower was a great deal more than anything else, and who in the matter of Auriculas and Polyanthus could hold his own with the best; but bricks and mortar extinguished him. He lived at South Street, Camberwell, and what with railways and new buildings his garden became so hampered in that light and air were reduced to a minimum; and although he cultivated a few flowers, and indeed not long ago exhibited a very nice seedling grey-edge Auricula called Mrs. Butcher, he mournfully said his days for growing flowers were gone; but he, like most Auricula growers, retained his love for them to the last, and acted as judge at the small exhibition of our Metro-

politan Floral Society. He was one of the few remaining of the old school of southern florists. He was kind and genial in his manner, and many of us who knew him in former days will regret that we have no more the opportunity of seeing him at those exhibitions where florists' flowers were shown.—D., Deal.

### OUR BORDER FLOWERS—HELLEBORES.

WHAT changes have taken place, and what numbers of plants have been introduced since *Helleborus hyemalis* found its way to our gardens in 1596! Now it is known as *Eranthis hyemalis*, of which Mr. Robson wrote so charmingly about a short time ago. Too much praise cannot be lavished on this the first harbinger of spring. The *Helleborus* family, both native and foreign, will flourish in most places. They delight in good loam and decaying vegetable matter. We most of us know how the Christmas Rose, *Helleborus niger*, is appreciated. We are indebted to Austria for this gem of our gardens. It can be turned to good account for decorative purposes in or out of doors, and is useful for cut flowers. The Winter Aconite and *Helleborus niger* must have found their way here together, for we are informed that the Christmas Rose was introduced by Gerard in 1596; he must have been an enthusiast in his day among plants. I wish we could have a reprint of that *Herbal* of his in his own quaint language.

kind, desirable on account of its greenish-yellow flowers. *H. cupreus* is one of the earliest-blooming kinds, of dwarf habit and very distinct, and is a good rock plant. *H. olympicus* has a pretty effect, being one of the tallest growers, having greenish-white flowers. It is one of the early-blooming kinds.

A few of these grouped together have a very good effect. They continue long in bloom, and are perfectly hardy. The choicer kinds may be increased by division, which is best done after the flowering season is past. The greatest recommendation of these plants is that they bloom at a time of the year when many other plants are at rest. The more we see of these plants the more interesting they become.

### COMFREYS.

How varied are the circumstances under which our border flowers are found—some at our feet, while many come to us from distant lands; yet the members of the same family in some unaccountable manner resemble each other in some form or other, though varying widely in aspect and stature. In some we see the giant form as well as plants of smaller dimensions, and in no family of plants do we see this exemplified more than in the family of Comfreys.

*Symphytum asperum* is said by some to be vulgar or coarse-looking, and not one of the pleasantest of plants to do with. Granted; but when in its element a plant of it 7 feet high in pyramidal form is when seen at a distance a sight not soon to be forgotten. It is a capital plant for the back row of a large border, or in a half-wild state left to itself it is equally pleasing. All that is required is a good depth of soil to grow it in—good loam is the best—and it will then take care of itself. *S. officinale* is sometimes met with in hedgerows and by waysides; it is said to be in possession of healing properties. *S. tuberosum* is desirable on account of its yellow flowers; it is said to be a native of Scotland. Another variety called *S. patens* belonging to ourselves is also desirable; it has blue flowers.

*S. bohemicum* is one of the choicest of the race, its beautiful changeable crimson flowers are a strong recommendation to its introduction to all collections; it comes into bloom in the early summer, and continues for a length of time. *S. orientale* is a grand addition to any collection, having white flowers it contrasts favourably with the darker-coloured kinds; a group of these plants are a host in themselves. *S. caucasicum* is a very desirable and distinct species. I have a variegated form of this which I should not like to be without, it being thoroughly hardy and of decided colours; it is of great service as a bedding plant where strong-growing plants are in request, especially for centres of large beds; it is equally effective in border, shrubbery, or wilderness, and is noted by all who see it. There are other kinds that might be named, and ought to be more frequently met with.

They are all easily increased by division in the autumn; good sound loam, leaf mould, or decayed vegetable matter, with a little coarse sand mixed with the soil, and the ground broken up to the depth of 2 feet, will be a suitable medium for them to develop themselves in. They like moisture, but if too wet they sometimes rot-off.—VERITAS.

Fig. 20.—*Helleborus viridis*.

*Helleborus foetidus* should not be passed by unnoticed. Often during the winter and spring in semi-wild places it may be observed showing its great trusses of drooping flowers, as though it were afraid to show its face to the sun; to see this plant en masse in the open spaces under trees in the neglected shrubbery, with their sombre green leaves, where they have been increasing undisturbed for years, dangerous as their medicinal properties are, is a sight not to be despised. *Helleborus viridis*, as seen in some of our limestone districts, in coops, and under hedges, in pastures, is a sight worth going some distance to see. When brought into cultivation its curious-looking leaves and pale green flowers claim for it more attention as an early spring-blooming plant than it is at present receiving. *Helleborus atro rubens* is a more showy plant than the two foregoing kinds, and ought to be more generally cultivated, especially in the shrubbery border, where it is quite at home in moderately good garden soil and in partial shade. A good plant well established is a very desirable object; it should not be often moved. *Helleborus colchicus* is one of the very choicest of the race, and perhaps one of the least known; it requires time and care to have it well established, and when it has done so leave well alone. It ought to be in all collections of herbaceous plants. *H. graveolens* is an early-flowering

### WIRE NET FOR PEAS AND STRAWBERRIES.

To obtain pea sticks in most of the localities of the three islands is no joke; therefore, this year I ordered a quantity of 10-yard lengths of wire netting, 2 feet wide and 3-inch meshes; these I use for Peas and Strawberries. For the latter a 2-foot breadth put over in spring like an arch enables them to rise while in bloom through the meshes, and when they are ripe they are out of the clay, clean for the mouth, beautiful to the eyesight, and ornamental; and for Peas I certainly prefer the half-hoop or arch also with them. For a 10-yard length of netting twelve pins of wood are required 1½ inch square and 12 inches long pointed at one end, six pieces of galvanized wire 1 yard long, and with four staples of the same material; fix one of these upon two pins, leaving 2 feet clear to form your arch for the wire, drive your pins into the ground upon each side of your Peas (say 6 or 8 inches), form your arch neatly, and fix your wire over these, and use Carter's Early Gem Pea, and if your land is what it ought to be you will have a return of, may be, an hundredfold. These with me this year are fully 2 feet high, beating all the others in a center for quantity and quality.

If taller kinds are grown your arch of wire must be regulated

thereto. The kinds I have this year are Bingleader, Laxton's Alpha, McLean's Little Gem, Dwarf Green Mammoth, Fillbasket, and McLean's Best of All. Each and all of them are fine crops. The Strawberries are Keen's Seedling, President, and Elton Pine.

I trust this may be useful to all gardeners, but more so to such as I am. My early Peas are finished, and the gleanings saved for seed next year. Since writing the foregoing I have drawn from a line (sown in April with 12 ozs. of Hairs' Mammoth), the produce of two peas which I sowed, and counting the 10 yards I find there are twenty or more plants on the yard, say two hundred equal to those sent you, as every plant will give the half of these two—viz., over forty pods each.

All wrinkled Peas should be sprung, picked, and planted. My experience for myself and others exceeds half a century, and I am now—OLD SECTY. JACK, Jedburgh, N.B.

### THE NATIONAL GOOSEBERRY SHOW.

THIS Exhibition, which was open to all England, was held at the Falstaff Hotel, Market Place, Manchester, on August 7th. The following are the awards and weights of fruits exhibited:—

			Dwt. Grs.
William Ridgway .. Green .....	Premier Prize ..	Shiner .....	33 6
John Downs .....	First Red .....	Stewards' Prize ..	31 18
Thomas Bradley .. First Yellow ..		Ploughboy .....	29 3
Charles Leicester .. First Green ..		Garibaldi .....	29 3
John Bostock .. First White ..		Seedling Cheerful ..	30 9
James Warburton .. Second Red ..		Antagonist .....	29 5
Charles Buckley .. Second Yellow ..		Lord Derby .....	30 28
William Sanders .. Second Green ..		Ringer .....	28 17
Samuel Birchenall .. Second White ..		Surprise .....	27 2
Bradley Bradley .. Third Red ..		Careless .....	25 15
J. O. Minahull .. Third Yellow ..		London .....	29 0
James Salisbury .. Third Green ..		Leveller .....	27 7
George Beckett .. Third White ..		British Oak .....	26 18
James Threlfall .. Fourth Red ..		Succced .....	25 8
William Weston .. Fourth Yellow ..		Telford .....	25 28
John Wynne .. Fourth Green ..		Oldham .....	26 4
Joseph Livers .. Fourth White ..		Stockwell .....	26 13
Daniel Bower .. Fifth Red ..		Postman .....	24 19
Faithful Jameson .. Fifth Yellow ..		Dan's Mistake .....	25 10
John Torkington .. Fifth Green ..		Mr. Clough .....	26 0
Robert Downs .. Fifth White ..		Souter Johnny .....	25 5
		Overseer .....	24 0

—CHARLES LEICESTER, Nurseryman, Macclesfield.

### CARNATIONS AND PICOTEEES.

MR. DOUGLAS need not have "swallowed me up quick" for the observations I made upon the exhibition of Carnations and Picotees, for I thought I very carefully guarded myself from the charge of imputations of bad practices against any of the exhibitors; but I noted it as a curious instance of the ethics of the exhibitors of florists' flowers, that one flower may be metamorphosed with impunity, whilst in another it is a disqualification. And when I said the public are deceived it was nothing more than this, that outsiders believe they have only to procure these sorts, cultivate them well, and they can obtain such blooms. And the burden of my statement is this, that if ever so well cultivated, an exhibitor who can dress a flower well can beat to nothing one who is not up to it. As to Mr. Douglas's flowers, I made no allusion to them in particular. I heard a somewhat similar observation to that which he alludes to, but these words were added—"a little more dressed." I am also aware that all flowers do not require this dressing. Let me take two in the same class. One, Edith Dombain, never splits a pod, the flowers open regularly, and it hardly requires the placing of a single petal; but take Mrs. Fordham, a large, full, and thick-podded flower, and I maintain it is utterly impossible to exhibit it as it was shown at South Kensington without pulling out a considerable number of petals and so altering the entire build of the flower, and it is that which constitutes the great difference between north and south. Such flowers will not be tolerated at the National Show; and I should very much like Mr. Horner to tell us what is the meaning of the rule that if a flower be mutilated the stand is disqualified.

Say what one may, I contend it is a very curious matter this dressing of Pinks and Carnations. It places them in an entirely different category to many other florists' flowers. You may arrange the truss of an Auricula, the spike of a Hyacinth, and the petals of a Dahlia, but it makes no material alteration in the character of the flower; but let a split-podded Carnation be placed in the hand of a good dresser, and "its own mother would not know it again." And with all due deference to Mr. Douglas, I do not think washing his hands will alter the case. I have no doubt he thinks anyone with care could grow as good flowers as he exhibited, but as to their being able to exhibit them as he did without some lessons and a good deal of practice I beg leave to differ.

Let two instances suffice to bear out my position. I was last summer standing in the garden of a very valued friend in the north of England. We were looking over his Pinks, which were very fine. He gathered one and said, "Give me ten minutes, and I will so metamorphose this flower you would not know it;" adding, "in my day I was the best dresser of Pinks in my neighbourhood." While I heard at South Kensington another friend bemoaning that his wife was not well, and unable to attend to the flowers, for, said he, "I never met her equal in dressing a Carnation." And again let me repeat it, alongside of such, an ordinary mortal would have no more

chance than would a country dressmaker beside M. Worth or Augustus Ahlborn, even though they had the same person to dress and the same materials to work with.—D., *Deal*.

### THE VINE BORDER.

As the growth and fruitfulness of the Vine depend in a measure on the border, its construction and material, I beg to call the attention of intending planters to a few points worth notice. After the site is cleared it is often necessary to ease the bottom of the border. This is effected by putting on rubble and pouring on soft mortar, spreading evenly, allowing it to set, taking care to give a fall for water to the drain in front. Observe, it is usual to place the crocks, &c., inside the pot, not under it; the drainage should not be too rough or sparse—6 inches is ample. Partitions of single brick and mortar are useful, enclosing the border with a substantially-built wall, preventing rats, &c., from burrowing into it. The dry bricks will answer the first year or so, making half the border. Any free soil will grow Grapes. There is nothing better than turfy loam chopped as for other plants, with a free admixture of charcoal and building rubbish, passed through an inch sieve. It is important that the whole of the compost should be thoroughly oxydised, adding very little manure, well mixing and making firm in the border. Avoid treading in future, wet or dry.

The next point is manure. For young Vines solutions are easily applied, also for fruiting Vines a freely soluble manure applied during growth is the best stimulant. I have no idea of burying bones. Bone dust and blood manure with stable dung will give an unusual increase of fruit if properly applied. The bone dust should be put on after the Grapes are out (December) with a sprinkling of blood manure or guano, and covered up with fresh manure and shutters if outside. Blood is again served out twice or thrice during growth with plenty of water. I need scarcely add, with other proper attention first-class Grapes will be produced.

N.B.—I am perfectly satisfied much of the shanking, &c., is due to mutilations with the knife during growth.—C. PRUNER.

### SPURRING MORELLO CHERRIES.

HAD our talented friend Mr. Taylor read the first part of the paragraph relating to the summer pruning of the Morello Cherry (see page 65), I do not think he would have found other than a coincidence in the views he expresses at page 108. There is a difference, however; Mr. Taylor advises "disbudding" in addition to "pinching." Disbudding I do not practise nor advise, as every shoot the Morello Cherry produces may, by stopping to three leaves, be had fruiting the following season, and this without crowding, even when the laying-in practice is adhered to. Beyond this I fail to notice any difference in the views expressed at page 65 and those at page 108. If Mr. Taylor, however, objects to spurring the Morello Cherry on account of the greater cropping and quality of fruit of trees treated upon the orthodox laying-in of young wood as compared with those spur-pruned, I must testify that such is not my experience.

It was not, I believe, until Mr. Rivers gave us the Morello upon the Mahaleb stock for cultivating as pyramids that spur-pruning for this tree was thought of; and finding spur-pruning to answer for trees cultivated as pyramids, and limited very often as they and wall trees are to space, I considered, that answering well for pyramids in the open, it would be equally available for those trained to a north wall, and the result has been equal to anticipation. The trees spurred bear as well as those with the wood "laid-in," and if anything better, for there are less unfruitful parts of the past or current year's growth, the spurring increasing the fruitful and diminishing the unproductive parts, the trees spur-pruned being masses of fertility from the multiplication of the fruitful parts which stopping entails. It is easier for the roots to cater for two or three leaves, than for the leaves upon a shoot a yard long.

I have trees treated both ways—shoots laid-in and shoots closely stopped, and the advantage is decidedly in favour of the spurred trees. The fruit is more abundant, as fine, and ripens earlier, which is only what may be looked for from the spurring admitting the light and air to have full access to the leaves and fruit. There are no long laid-in shoots nor bare useless wood to support, which first overshadowing the fruitful shoots to their injury can only, in a full-trained tree, have place until exhausted shoots are cut out. No tree, especially a fruit

tree, should, in my opinion, be allowed to form useless parts; and as exhausted shoots are made such only by the mode of young laid-in wood, I consider it better to leave a practice, old and good as it may be, for one easier performed, less exhaustive, and equally advantageous in quality and quantity of crop.

"When the idea is to economise labour," writes Mr. Taylor, "and to have a fair return for the same, trees should be trained in the way their natural habit suggests; and it is just as wide of the mark to spur Morellos and Black Currants as it would be to train an Oak tree to a balloon trellis." Economise labour, indeed, by laying-in shoots of Morellos a yard long and cutting-out exhausted shoots! Whether is easier—requiring less time—to stop a dozen shoots, or lay-in growth a yard long, to cut out exhausted wood and afterwards nail such shoots? By the latter mode more skill and time is required, and greater expense is incurred in nails and shreds, and the work is less comfortable to the operator. As to "natural habit," what is there natural in training a tree to a wall? Nothing natural whatever; the whole is artificial, as is that of a tree trained as a pyramid, for the habit of the Morello is diffuse, forming a round head as diffuse and as pendant as a Beech, being very much like the Bird Cherry (*Cerasus Padus*).

If the object be to "economise labour," it will best be sought by planting standards of Morellos, as is practised with others of the same family, also Apples, Pears, &c., in orchards, and let them take care of themselves. They in a few years will give bushels of fruit, but trees in this natural state do not afford proportionately heavier crops than a pyramid tree, which from its growing in a circle of perhaps 2 yards diameter, and being only 2½ yards in height, is more suited to the proprietor of a small garden, who in the space required for a standard tree in its "natural habit" expects to supply his wants in Apples, Pears, and Plums as pyramids as well as Morello Cherries; and how is the proprietor of a small garden to have his Apple, Plum, and Cherry pies, as well as Pears to stew, with some of all in a ripe form to refresh himself, if he do not limit them to allotted space by artificial means? It is not a question of training "an Oak tree to a balloon trellis," nor of spurring the Black Currant; but I see no objection to the latter, any more than to spurring the Morello Cherry, if by so doing we so overcome natural habit by cultivation as to make it subservient to the wishes and requirements of man. No trees are so profitable on account of their prolificacy as pyramidal Morellos spur-pruned, and two of which I advise to be grown in every cottage garden in the kingdom.

I am very glad Mr. Taylor is striving to make "Pear-growing become popular among our cottagers," and with those surely he will not advise training them as their natural habit suggests, or they will find space for but a small number and variety, or a jungle of unfruitful growth. Spare them this by close summer-pruning, and give us your experience in three years' time of results attending the spurring of Morello Cherries.

Sécateurs are very handy implements. Not a tree I have has such strong wood as to require their use, being easily cut by 4-inch scissors. Were the wood so strong as to require the nip of the sécateur, I should consider the trees wanted curbing at the roots, which is a more certain way of preventing robust growth, and giving in the place of long sappy growths less exhausting and more useful spurs.—G. ASHBY.

### EPIDENDRUM AURANTIACUM.

THE genus *Epidendrum* is one of the most extensive of the whole Orchid family, no less than three hundred distinct species and varieties having been discovered. A large proportion of them have been introduced to this country, but not a tithe of the number is at present to be found in cultivation. The flowers of many of the species are pretty enough; for instance, *E. stenopetalum* has beautiful rose and white flowers, but being produced two or three together instead of in large panicles, as in *E. syriothyrus*, they make no show, and the plant has well nigh dropped-out of cultivation. Many of the species can only be regarded as botanical subjects, and as such have found a place in national herbaria. All the species are stove epiphytes, nearly the whole of them being found naturally growing upon trees, which is a hint as to the system of culture to be pursued. Some of the very finest of the species, such as *E. vitellinum majus*, thrive best on blocks.

The subject of the present notice is a native of Guatemala, and was introduced to this country in 1835. It is one of the

species that grows well cultivated in pots. The pot should be filled to quite three parts of its depth with clean crocks; over the drainage place a layer of fresh sphagnum washed clean; then the compost, which should be of fibrous peat, sphagnum

chopped fine, a few bits of charcoal, and a large proportion of broken pots. If the roots grow into a solid mass of sphagnum and peat this will in time decay, and all the roots in the mass will be seriously injured. When the plant has finished its

Fig. 21.—*EPIDENDRUM AURANTIACUM*.

growth it requires a season of rest, and this is done by gradually withholding water, and only giving the roots enough to prevent the bulbs from becoming too dry.

It succeeds best in the warmest part of a cool house, say a minimum temperature of 50°, and when it is making its growth the compost should be kept moist on the surface by watering it with a syringe or fine rose, and this ought to be done so that the body of the compost does not become saturated. This species, like the rest of the genus, thrives best when the pot or

block on which the plant is growing is placed near the glass, shading from bright sunshine.

#### THE ARRANGEMENT OF COLOURS IN THE BEDS OF THE LONDON PARKS AND GARDENS.—No. 2. DESIGN FOR FLOWER GARDEN ON GRAVEL.

THE design here given represents the beds as laid down on gravel, surrounded with a wide margin of grass. The figures

are formed with Box edging, leaving intervening alleys. There are six entrances, one at each end and two on each side, and in the centre of each a small circular bed with a Rose tree or upright shrub in the centre of it, which takes off the formality. The two circular beds are for vases, which may be made to

add still more beauty to the effect by filling them with drooping plants, which would be very appropriate.

This design should be placed in a level and open space near the house, and be so constructed that all the compartments may be seen from the windows; and if well kept, neat Box

Fig. 22.—DESIGN FOR FLOWER GARDEN ON GRAVEL.

edging, smooth and well-coloured gravel, and smooth grass verge and lawn, the design will be found attractive.

The following is a list of plants and a suitable mode of arrangement for this design:—

- 1, *Coleus Verschaffeltii splendens*
- 2, *Oenothera asplenifolia*
- 3, *Verbena Sportsman*
- 4, *Vase*
- 5, *Coleus Verschaffeltii splendens*
- 6, *Centaurea gymnocarpa*
- 7, *Verbena Purple King*

- 8, Silver-variegated *Geranium*
- 9, Pink-flowering *Geranium*
- 10, Blue *Lobelia*
- 11, *Alternanthera paronychioides major*
- 12, *Lobelia Blue Stems*
- 13, *Stellaria graminea aurea*
- 14, Rose or pink *Geranium*

- 15, *Iris* Lindley
- 16, Golden *Pyrethrum*
- 17, An upright shrub or Rose tree, with a carpet of *Alternanthera amara spectabilis* or *Coleus Verschaffeltii splendens*
- 18 and 19, *Hebeviria secunda glauca*.—H. COLE.

**METROPOLITAN FLORAL SOCIETY.**—We are requested to state that the grand Autumn Show of this Society will be held at the Alexandra Palace on the 24th and 25th inst. A very liberal schedule has been issued, and intending exhibitors must notify

their intention of exhibiting on or before the 16th inst. to the Hon. Sec., the Rev. H. Honeywood Dombrain, Westwell Vicarage, Ashford, Kent.

### HINTS ON VERBENA CULTURE.

THERE are few plants that deck our flower gardens during the summer months which surpass in beauty the Verbena. For many years past it has been a favourite with rich and poor; if, however, we are to believe the reports that reach us from various quarters, its popularity must be on the wane; this is to be regretted, for the great improvement which has taken place in this species of plants during the last ten or twelve years justly entitles it to a place in every garden. No doubt one of the chief causes of its decline in public favour is the difficulty many experience in propagating it in the autumn, and in keeping healthy plants through the winter.

The usual mode of culture is to strike cuttings in store pans in August or September, and place these pans on a shelf in the greenhouse through the winter; the result of this plan generally is, half the cuttings damp-off at the beginning, and those which survive become before spring infested with all sorts of insects.

Having grown for sale large numbers of these plants, perhaps a few remarks showing the treatment pursued may be of service to some readers of this paper. About the third week in August a quantity of 2½-inch pots (generally known as 72's) are filled with light sandy soil; no crock is placed in the bottom. These pots are carried to the Verbena beds, and with a trowel are sunk in the soil; a trailing shoot 6 or 8 inches long is then pegged down on each pot and slightly covered with soil, taking care that a joint of the shoot is in the centre. To prevent its growing and rooting beyond the pot the top is tied-up to a small stick, and the point pinched-off. If the weather is dry the bed is watered every alternate day. In about three weeks the pots will be filled with roots. The young plants are now severed from the old and placed in a shady frame for a few days, and sprinkled with water overhead once or twice a day if they flag. The next step is to shift them into 48's, which must be clean and well drained. Light rich soil is used, and the leading shoots pinched-off to make the plants bushy. Shading for a few days may be necessary if the sun is very powerful, but the plants are fully exposed both to sun and air as soon as they will bear it.

About the middle of October they are removed to an airy shelf in the greenhouse. If there is the slightest sign of aphid or mildew the plants are dipped into a strong solution of Fowler's insecticide. A liberal supply of water at the roots is now given, and through the winter the plants are never allowed to become very dry. Two or three times during the winter the pipes are smeared with sulphur mixed with milk; when the water boils the fume of the sulphur is diffused through the house and mildew prevented.

Early in January the plants are again shifted into 82's, and placed in heat where the temperature ranges from 60° to 70°. In a short time I have an immense quantity of cuttings, which root freely when plunged in bottom heat and shaded. As soon as rooted and hardened a little the cuttings are potted into small pots. If allowed to remain long in the cutting pots the plants become stunted in growth and comparatively useless. The old plants give a crop of cuttings about every ten days. Sometimes a blight appears resembling mildew, but of a dark colour; it is usually caused or greatly increased if the growth has been checked by a sudden change of temperature, want of water, or, as already stated, allowing the young plants to remain too long in the cutting pans.

All plants so attacked are thrown away at once, and the pipes again smeared with sulphur; as the season advances more air is given, and towards the end of April the plants are removed to a cool frame. Those required for stock are planted-out the third week in May in rich soil, and plenty of water given.—H. DUDDELDEN, *The Dorset Nurseries*.

### DESTRUCTION OF ANTS IN GARDENS.

SPEAKING to a gentleman of Ulverston the other day, whose long experience renders him an authority on gardening matters, on the above subject, he kindly consented to write me down his views, which he has done as follows:—

"I have for a long time been favoured with the perusal of the *Journal of Horticulture*, and have frequently seen the question asked, How to destroy ants? and have smiled at the

advice given—namely, sugar in a sponge, oil in a saucer, &c., whilst at the same time I was fighting and trapping them in my own garden, and have at last, I hope, completely succeeded in clearing it of them. As probably some others may wish to do the same, I give my *modus operandi*. I say 'some' others, because I am aware there is a difference of opinion regarding their usefulness or destructiveness in a garden or greenhouse. My garden is situated on high ground, sloping to the south, and is very favourable for ants. Being naturally bare of soil, I have added very much, amongst which, and about the first, was a cartload of ants' hills, the same being recommended to me as being the finest soil. In this consisted my introduction to the pests; and although I have during forty years destroyed many colonies by the aid of boiling water, I have never until within the last two or three years set traps. These traps consist of pieces of slate laid between the plants where the soil is perfectly dry, and they must not be disturbed in any way until a fitting time when the ants are most likely to be at home—viz., on a wet day or in the evening, when you go with trowel and kettle in hand and exterminate them. By adopting this simple yet effective plan I have found only one colony this spring, and have not seen a single ant for months, nor is there one at present to be found on slug-eaten Pears or fruit of any kind—a very unusual thing.

"The ants above alluded to are the red ants; but for two or three years I was troubled with black ants in the Cucumber frames. These were trapped in a different way—by lifting all the ova with a trowel, and depositing it in, say, a 6-inch pot, and inserting the latter in the bed; then invert a pot, a size or two larger, over it. After a week or so every ovum and ant will be settled like a swarm of bees. At night take a bucket of boiling water, and lift the whole colony into it. Such are the effective results of my experience, and I feel assured they will be equally salutary in the case of others who may give them a trial."—BETA.

### NEW BOOK.

*Rambles in Search of Shells, Land and Freshwater.* By J. E. HARTING, F.L.S., &c. With coloured illustrations. London: J. Van Voorst.

THIS is a volume of that class which we always welcome heartily. It renders science readable and interesting even to those who read merely for amusement, and, moreover, it opens an attractive pursuit for the younger members of any home circle. Well do we remember the contemptuous tone in which the query, "Who cares about shells?" was uttered, and we are now able to reply, Read this little volume, and then tell us who is there that ought not to care about shells.

The author has succeeded in his endeavour to avoid being "too technical or systematic;" he has enabled anyone to identify a native land or freshwater shell; and he has rendered the study attractive by detailing popularly the habits and anatomy of the species. One extract will suffice to prove this:—

"In the early days of conchology it was held sufficient to study the shells only of these animals, and the possessor of an extensive collection of such shells might be intimately acquainted with the name, geographical distribution, and proper place in a systematic arrangement of every specimen in his cabinet without necessarily knowing anything of the animal that formed it. Now, however, the conchologist has given place to the malacologist, who, not content with examining, describing, and naming the shell independently of its inhabitant, curiously questions the latter as to its habits and internal structure, and in the case of those which possess a single shell (Univalves), he literally learns the relationship of each species from the animal's own mouth.

"Snails and slugs both have the power of drawing in their horns on being touched, and this is effected by a singular and beautiful apparatus; the tentacle is lengthened by gradually unfolding itself, and not by being pushed out from the base. Each tentacle is a hollow cylinder, to the apex of which is attached a muscle, arising from the retractor muscle of the foot, and by its contraction the tentacle is simply inverted and retracted, like the finger of a tight glove; its protrusion, on the other hand, is effected by the alternate contraction of the circular bands of muscles which compose the walls of the tentacle. As a rule slugs and snails are more liberally provided with teeth than any other animals in the parish, one of our slugs, for instance, possessing no less than 28,000; they are not, however, all in use at the same time. The dental apparatus of our univalves may be described as a tube lined with teeth set upon flattened plates, collectively called the lingual ribbon.

One extremity of this ribbon is open and spread out like a tongue, teeth upwards, on the floor of the mouth, so as to occupy, in fact, the same relative position as the tongue in the mammalia; the roof of the mouth is supplied with a horny plate, against which the open end of the ribbon can work backwards and forwards, so as to rasp and triturate the food between them. The tubular portion of this lingual ribbon is contained in a cavity behind the mouth, and as the teeth in use become worn or broken it is conjectured that they are absorbed, and a fresh set from the reserve in the tube is pushed forward to take their place."

To facilitate the collector's researches the species are grouped according to the soil they frequent; and the identification is rendered easy by the coloured figures of the shells, which we are able to say are most faithful and well executed.

### PETREA VOLUBILIS.

WHILE the ends of the earth are being ransacked in search of new plants, and our plant-growers at home are running after novelties not always realising the glowing descriptions with which they are ushered into notice, there is many a good old plant long introduced, but little known outside botanic gardens, which, if taken in hand and the same amount of care and skill bestowed upon it as on recent introductions, would throw many of the latter into the shade. Such among stove climbers is *Petrea volubilis*, a plant introduced more than a century ago, but of whose existence we venture to think few indeed of our great plant-growers are even aware, and of whose extreme floral elegance and beauty fewer still have any idea. In fact, for profusion of bloom and a certain lightness and elegance in its aspect combined with an exquisite delicacy and pleasing contrast of colour, it is perhaps, without a rival. It is a twining stove shrub, with leaves not unlike those of some of the *Bougainvilleas*, but larger. The flowers are borne in marvellous profusion in elongated light airy racemes. The calyx, which is corolla-like in colour and texture, is divided into five narrow strap-shaped segments, of a very delicate pale bluish mauve, they are about twice the length of the segments of the corolla, which is of a lovely purplish blue, forming a pretty and striking contrast with the pale tint of the widely spreading segments of the calyx. The corollas are rather fugitive, but on the other hand the delicately coloured and flower-like calyces are remarkably persistent, and there is a long succession of flowers towards the ends of the racemes which will be found disporting their blue corollas, and in this way, perhaps, rendering the contrast and effect more unique and striking. In the flowers of *Petrea* we have a colour altogether unique among stove climbers, and one very desirable as regards variety to see on the exhibition stage, where this plant would tell with fine effect if turned out in the same style as we see *Clerodendron Balfourii*, *Stephanotis*, *Rhynchospermum*, *Allamandas*, and other exhibition favourites.

It forms a beautiful object trained to the roof or back wall of the stove, the graceful and elegant pendant racemes hanging in wild profusion, while at the same time there is an airiness and lightness in the floral picture peculiarly its own. It will grow freely in a compost of good light fibry loam to which a little sandy peat is added. Cuttings root freely in sand plunged in heat and covered with a bell-glass. When growing it likes a moist heat and to be watered freely, but when at rest it should be kept rather dry than otherwise. Good drainage is also essential. There are one or two other species almost if not equally pretty as that at present under notice; all natives of Vera Cruz.

The generic name was given in honour of Robert James, Lord Petre, who died in 1742, and of whom the celebrated Collinson writing to Linneus speaks as being one of the "greatest losses botany or gardening ever felt in this island."

At Glasnevin *Petrea volubilis* is trained to the roof of the large greenhouse, which when in flower is more admired perhaps than anything else in the same department.—(*Irish Farmers' Gazette*.)

### FLOWERS OF HARDY TREES AND SHRUBS

AVAILABLE FOR DECORATIVE PURPOSES.—No. 2.

A CASUAL glance is only needed to see how highly attractive are even the most common trees. If we examine them carefully we find that they possess decorative qualities of no mean order in habit, foliage, flower, or fruit. If we traverse our ordinary country roads in spring and early summer we find the Beech in most seasons loaded with fruit, which in its young and bearded state and coupled with the bright green

unblemished leaves, present a natural wreath our hothouses fail to represent. Not less beautiful, but in a different way, is the Birch, its lovely pale green catkins hanging like eardrops from every leaf joint on the delicately-formed stems, which form so striking a feature in this tree, and to which the fruit alluded to gives a still more pendant habit. For the drooping edges of an elevated flower stand I know nothing better when in season than the Birch; but, like the Beech, it is most pretty when in a young state, its foliage at that stage being more pure and unsullied by the elements than it is at a later period.

We now come to a larger tree still, and that is the Elm, one species of which blooms in the greatest possible abundance during the latter part of April and the beginning of May, and before its leaves make an appearance, when its flaky clusters of pale green flowers in some measure resembling Hops, in some seasons so completely cover the tree, and when they fall so completely cover the ground, I have often wondered whether any other plant, native or foreign, is so productive in that way as the Elm; it does not so easily assimilate itself to the wants of the flower stand or bouquet, but in itself it possesses a mass of beauty rendered the more attractive by its abundance. Some trees produce a much paler and more delicate inflorescence than others, but all are pretty.

Still more interesting than the Elm is the Ash, which not flowering in the sense here alluded to until the foliage is pretty well advanced, when we have these beautiful bunches of what are commonly known as Ash keys, which have at all times been favourites with children and not a few grown-up persons either, their beauty continuing so much later in the season than that of most other flowering plants, while the beautifully-pinnated foliage and general outline of the tree give it a charm many other trees do not possess; and the rustic who sticks a bough in the bridle of his team of horses gives them greater grace than is often obtained in a parade where spectacle is the object sought after. Ash keys, therefore, require no further comment just here, so we pass on to another class of trees of which so much has already been said by others that it is not needful to enlarge. The Horse Chestnut requires but little comment, its beauties as a flowering tree exceeding that of most Orchids or tropical plants which I am acquainted with, while its habit as a tree is well adapted for setting off that lovely blossom to advantage. Un fortunately its flower-spikes do not always mix agreeably with others in the stand for the table, they being mostly crooked in the stem, but when obtained from near the top of the tree they work in much better; but it is hardly necessary to say that, like many other flowers, they look better on the tree than anywhere else, and a fine spreading specimen studded all over with blooms is perhaps as handsome an object as can be looked at. Scarcely less so, but in another way and also at another season, is the Sweet Chestnut, which produces long, white, cord-shaped or whip-thong-like scapes of flowers, seated as they are in the midst of a tuft of leaves of the brightest and darkest green, giving the plant a tropical aspect, which its late flowering tends to confirm; branches of Chestnut serve a very useful purpose in outdoor decoration when required late in the season, or where it is required indoors on an extensive scale. Certain it is the Sweet Chestnut is one of the most useful trees we have at this season, its appearance being alike good when gathered as when growing on the tree; while the general aspect of the tree, being of a darker hue than most others, is also in its favour, the foliage generally being good.

The Oak is a less attractive tree in spring than in autumn, its foliage being its principal feature, but that being of a sturdy kind is often brought into use at an earlier age than that of other trees; while in autumn, when it is loaded with fruit, it is very pretty. Other trees have also their beauties: the Norway Maple, Oriental Plane, and Sycamore have all a something-in-common in their copious handfuls of seed vessels; the winged character of these, with other objects of interest attached to each cluster, render them all beautiful in their way; but we have not space to pursue this object further amongst large trees, otherwise some would say that the cones of our Pines are each capable of forming some pretty object, and, in fact, are pretty in themselves. We now pass again to objects of more humble growth.

The Bird Cherry is a shrub not so much inferior to the *Deutzias* as might be supposed for its beautiful blooming qualities; and still more showy and certainly rendered more conspicuous, is the Elder, trees of which seem almost entirely covered with bloom this season. The Elder is a very conspicuous tree in the dusk of the evening when it is in flower.

Not less beautiful, but in a different way, and like the Elder, is perhaps offensive in the odour it emits, is the common Privet, which blooms abundantly, and when allowed to do it produces abundance of shiny black fruit or berries in conical clusters of great beauty in autumn; while in the wet and marshy places the Alder may be met with, producing its globular seed vessels in abundance with its bright green leaves, to be succeeded by a fruit vessel or husk, that looks well the following year if allowed to remain on the tree. Amongst still lower growths we have the Bramble, ornamental when in ripe fruit; the Clematis while ripening its seed vessels, and when its bleached remains clothe some rugged hedge or copse with tufts of cottony-looking down, appropriately called the Traveller's Joy; while descending still lower we have Heaths.

Enough has been said to draw attention to the merits of some of our most common trees and shrubs, the most, if not all, of which are of British origin, and consequently in general within nearly everyone's reach; and the part they are all capable of taking in assisting the now-a-days all-important duty of ornamenting a table, room, or other given space, is such that unless we have the means of falling back on something that can be had in great abundance, there is a fear our exotics will fall short of what is required of them. It is, therefore, with a wish to call attention to the merits of very common things that the above is penned, and possibly a return to the subject by way of calling attention to other hardy plants and their claim to notice may be acceptable; and who knows but amongst the vagaries of fashion our ditches and wastes may have to take their turn in furnishing materials to decorate the drawing and dining-rooms of the great and wealthy, and after the Antipodes have been ransacked of their floral treasures it may be found that many at our back doors are still good? Some good may, perhaps, be obtained by urging the attention of those concerned in that direction.—J. ROBSON.

#### NOTES AND GLEANINGS.

MR. EDWARD LUCKHURST writes from near Uckfield in Sussex:—"The whole of the PEACH and NECTARINE TREES here are in splendid condition, and the crop is abundant and fine. Early Beatrix Peach ripe the middle of July, and a daily dish of it sent to table till last week. Early Rivers Peach keeps up the supply; the first ripe fruit August 2nd. Lord Napier Nectarine is a fine crop; its fruit is just colouring, and some of it already measures nearly 8 inches in circumference. Early Rivers Plum ripe the last week in July, and plenty of its fruit still upon the trees. Early Rivers Damson planted last season also has ripe fruit upon it; this is a great advance upon the older kinds."

—We have received from Messrs. Thomas Kennedy and Co., Dumfries, yellow fruit of RED ASTON or WARRINGTON GOOSEBERRY, arising from a bud sport on a bush of the normal red form. This occurred between thirty and forty years ago in the garden of Mr. Archibald Gorrie of Annet Cottage, Perthshire, who propagated the shoot producing yellow fruit, from which plants were raised which continued to preserve this new character, and which became known as Yellow Aston.

—THE collection of STOVE and GREENHOUSE PLANTS, the property of A. Basset, Esq., Sister House, Clapham Common, were sold on the premises by auction by Mr. J. C. Stevens on the 5th and 6th inst. *Azalea Eclatante* was knocked down for £4 10s.; and *A. Extranei* for £4 15s.; *A. Mrs. Fry*, £6 10s.; *A. Madame Ambroise Verschaffelt*, £7 10s.; *Croton undulatum*, £7 7s.; *Alsophila squarrosa*, £4 10s.; *Dendrochilum filiforme*, £5; *Masdevallia Veitchiana*, £5 15s. 6d.; *Camellias* Countess of Derby and Princess Bacciochi, £7 7s. each; *Camellia Mathotiana alba*, £14 14s.; *Rhododendron Princess Royal*, £7 17s. 6d. The 535 lots sold for £1006.

—A CORRESPONDENT informs us that Mr. Sowerby, the head gardener at Hackness Hall, of which we recently gave an account, completed on the 8th inst. his FIFTIETH YEAR IN THE SERVICE of the Johnstone family. He is still hale and vigorous, and to all outward appearance likely to continue his services for many years. It is a noteworthy fact that there have only been three head gardeners since the formation of the gardens, which took place in 1795.

—THERE is a charming bit of romance about the recent wedding of Harry, the eldest son of Mr. Charles Turner, the florist of Slough, to Miss Elizabeth Poole, only daughter of the late Samuel Bacon, M.D., of Camden Town. The young couple met some years since, boy and girl, when the gallant

youth presented to the blushing maiden a GOLDEN APPLE plucked from the garden of the Hesperides—or, to put it more prosaically—an Orange. From the seed of that Orange, sown by her own hand, sprang an Orange tree. When the Orange tree bloomed for the first time, from its tiny branches were plucked the blossoms which adorned the hair of the bride at the Savoy Chapel.

#### — An old English garden—

"The wholesome Sage, the Lavender still grey,  
Rank-smelling Rue and Cummin good for eyes,  
The Roses reigning in the pride of May,  
Sharp Hyssop good for green wound's remedies,  
Fair Marigolds and bees-alluring Thyme,  
Sweet Marjoram and Daisies decking prime.  
Cool Violets and Orpine growing still,  
Embeathed Balm, and cheerful Galingale,  
Fresh Costmary and breathful Camomile,  
Dull Poppy and drink quickening Setoslae,  
Vain-healing Vervain and head-purging Dill,  
Sound Savory and Basil hearty hale,  
Fat Coleworts and comforting Parsnips,  
Cold Lettuce and refreshing Roes marine."

—We have received the "system of classification" of the UNITED STATES CENTENNIAL INTERNATIONAL EXHIBITION, which is to be held in Philadelphia in 1876. There are twenty-five classes for horticulture, including ornamental trees, shrubs, and flowers; hothouses, conservatories, graperies, and their management; garden tools and accessories of gardening; and garden designing, construction, and management. Pomology comes in under the department of agriculture, and consists of two classes—fruits of temperate and semi-tropical regions, and tropical fruits.

#### WENSLEY.

WELL, what of Wensley, and where is it? It is the capital of Wensleydale in Yorkshire, so much celebrated for its cheeses. It is a small, neat, picturesque village on a declivity on the northern bank of the river Yore, sheltered from the north and exposed to the full sunshine of both summer and winter. What struck me as interesting was the neat cottages and well-kept gardens enclosed by iron fencing, displaying their floral occupants to every passer-by.

There are two triangular village greens; on one stands a monster Elm, the girth of bole at 4 feet from the ground being 20 feet 6 inches, one of the principal branches being 10 feet in girth near the bole, extending 85 feet, the circumference of the branches being something near 250 feet. Round the base of this tree stonework is erected, fastened together with iron brackets in lead, forming a piece of solid masonry, where in days long past formed the gathering-place of old and young when the toils of the day were ended, or probably on those festive occasions when the peasantry and their lords used to mingle in old athletic sports, or may be ages past when the "guid housewives" of the dale here vended their dairy and other produce beneath the shade of this forest tree. In all probability this is one of the oldest trees extant. They used to be seen on all the village greens in the dale, but this is the only one that has braved the storm and is now glorious in decay. Beneath its shade stands the town pump in a stone case of huge dimensions, and which must have stood for many generations past.

The beautiful entrance to Bolton Park is close by. The other green with the fine clump of trees open to the road forms a delightful retreat for the children of the village. Many of the trees here are of immense size, especially Elms and Sycamores: such trees I have seldom seen. Many of the walls in the village are partly covered with *Asplenium Ruta-muraria*, *Sedum acre*, *S. album*, and *Saxifraga tridactylites*. Following the road at the foot of the hill a magnificent stone bridge spans the river Yore, whose banks are fringed with beautiful forest trees; this with the church close by forms one of the loveliest landscape scenes that eyes can look upon. It seems strange that the water-power of the dale has not been utilised for manufacturing purposes, as that power is immense. There are lead mines in the neighbourhood, but I believe they are capable of greater development. Crossing the bridge on the south side of the river I saw on the bank Sweet Cicely, or *Myrrhis odorata*, in abundance. The hedges and roadsides are flower gardens themselves; such masses of *Origanum vulgare* and sheets of Bluebells (*Campanula rotundifolia*), and the Giant Bellflower (*Campanula latifolia*), *Vicia cracca*, and *Ononis arvensis* are seldom met with; there are also *Geranium pratense* and other native plants.

I did not attempt to resist the desire to enter the church-

yard while passing, for there is always something to learn there; and what interested me much was an epitaph which I copied as follows:—"Mr. William Parham, gardiner to the Duke of Bolton, left to the poor of Wensley the use of a 100 pounds for ever. March 20th, 1670."—RUSTICUS.

## NOTES ON VILLA AND SUBURBAN GARDENING.

**PROPAGATION.**—Once more the time has come round when it is necessary to propagate all kinds of bedding plants for next season's supply; and it is as well to say that much time and trouble will be saved if, before the work is begun, a thorough plan is framed according to the means at command for storing these plants during winter. As a rule that plan is chosen which is likely to take up the least space to carry out—that is, the plants are stored away in as close quarters as possible consistent with their health. The aim should be to have these plants well rooted and established for their winter confinement, and not to grow them too much at this time of the year, leaving this to be accomplished on the advance of spring.

Pelargoniums of both the green and variegated class will root readily enough if put in on a warm border of well-prepared soil in the open ground, but then there is the trouble of taking them up and potting them, and some risk of their not being well established before the dull month of November comes in. For an amateur whose wish is to manage things economically, and without involving too much labour, the following plan would be preferable: Procure some boxes about 2 feet long, 18 inches wide, and from 8 to 5 inches deep; make a few holes at the bottom at different places for drainage, and place a piece of broken pot over each hole, and then put a thin layer of the siftings of soil over these; afterwards fill the box level full of fine soil, composed of loam, leaf mould, and sand in equal parts, well mixed together with the hand, press it into the box firmly. Such a box will hold from sixty to seventy cuttings, according to size. They could be made to hold more, but this number is sufficient to ensure their well-doing; if thicker they would be liable to damp-off in winter. Make every cutting firm after insertion, and make sure that the bottom of it is firm upon the soil at the bottom of the hole made for it. Water them well, and remove the boxes to some warm sunny spot on a south border, or under a wall. They may be allowed to have the full sun, which will make them flag at first, but it will do them no harm. Clear the boxes from the ground by placing them on bricks or boards to prevent worms getting in. In three weeks or a month the cuttings will be well rooted, as will be seen by their beginning to grow and flower. The flowers should be picked off, and just the point of each shoot taken out. They ought not to be encouraged to grow too fast; recollect that what is wanted for successful wintering is a close or stocky firm growth, not a strong sappy one. The plants may remain where they are rooted until there is danger from frost, then put them into cold frames or any light airy place where they can have the benefit of sun and a little fire heat occasionally to dispel damp. The boxes may be placed close together, and in this way many hundreds can be stowed away in a small space, and if moving is required it is quickly done at any time.

Variegated sorts of Pelargoniums. If these are rooted in the same way, by which they will do equally well, it may be necessary to take them in sooner, or even in heavy showery weather it will be well to place some glass over them, but it is not necessary in striking them. The variegated sorts require a little longer time to root, and as they are slower in growth also it is well to put them in first. In large establishments, where there is plenty of glass, the cuttings are at once placed in the pit, not in boxes; but the soil is prepared as it is in the open ground, and the cuttings inserted in it. Of course in such places there is the means of applying fire heat when necessary throughout the winter. There is one thing I ought to mention—that is, do not attempt to pull off the dead leaves which of necessity appear during the process of striking root. If you do the chances are that the cutting becomes loosened in its place, and probably does not root for some time after, if it does at all. These dead leaves do no harm at that time, but when the cuttings are rooted then is the best time to clear them off.

With respect to other classes of bedding plants, such as Verbenas, Heliotropes, Lobelias, &c., they will root easily in a frame, say a two-light frame, filled up to within a foot of the glass with first rough leaves beaten firm, then about 8 inches of light sandy soil over these made even, and the cuttings dibbed in about 1½ inch apart each way. Keep the frame moderately close, but shade from the sun, and at times sprinkle the cuttings with water to keep them fresh. After they are rooted they are dibbed into pots or pans about the same distance apart, and after establishing themselves here they are stored away for the winter.

There is another division among bedding plants, which I call the hardier class; these are Gazanias, Variegated Alyssums, and Calceolarias. Now these I always treat very similar—that is, they are rooted in the bed of soil in the frames, and here they

remain all winter, protected from frost by cold dung linings at the sides, and mat and straw coverings for the top. The Alyssums take longer to strike than the others, and should be put in as early as possible, and treated similar to Verbenas; but the Gazanias are not put in till October, and are treated exactly as for the Calceolarias.

I always divide my stock into about four classes; first there is the Alternantheras of sorts, and such-like tender plants, which require heat to root and grow them; then come the others as I have named above, and many thousands are stored away in a very small space.—T. RECORD.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### KITCHEN GARDEN.

We do not sow our *Cauliflower* seeds until the last week in August, and sometimes not until the second week in September, but taking the average run of seasons the first-named date is the best; the plants become strong before the frosts set in, and are better able to resist them. It is best to make two sowings, about two weeks at the utmost between each. In Scotland and the north of England it is necessary to sow a week earlier. Plants from the earliest sowing are planted in handlights; those later out of doors under a wall or pricked out in a frame, the glass to be used to protect them from frost or from wet. The sorts best adapted for sowing at this time are Early London and Walcheren. Where a large supply is required Lenormand's may be added. A sowing ought now to be made of Prickly Spinach. The soil ought to be rich, and the quarter should be in a sunny yet sheltered position. The spring-sown Onions are nearly ready for pulling up, and if the weather is fine they will be merely laid on the surface of the ground for a few days until they are dry enough for storing. In wet weather we have found it answer to tie them up in bundles, and hang them on hurdles fixed in the ground. We grow four sorts of Onions, and these answer our purpose very well both for autumn and spring sowing—viz., White Spanish, Brown Globe, James's Keeping, and the Two-bladed for pickling. It may be as well to note in passing, that in gardens where the maggot attacks the spring-sown crop, the autumn sowing invariably escapes. The reason of this is no doubt owing to the Onions being considerably advanced in growth before the dry hot weather sets in.

Our early kidney Potatoes have been stored, the variety being Veitch's Improved Ashleaf; there is no trace of disease in any of them as yet. The Extra Early Vermont is also free from disease; but this variety is so degenerated that it is really not worth growing. There is an excellent crop of Dalmahoy Regent in the garden. The haulm had been very much affected by the disease, and a few tubers had also taken it; all the haulm has been removed, and the rows earthed-up. We are not sanguine of this stopping the disease, but it may arrest its progress. We have been digging vacant ground, and planting it with Coleworts and Sprouting Broccoli. Hosing the ground, and carefully gathering-up all fallen fruit, and in other respects doing our utmost to keep the kitchen garden neat.

### PINERIES.

Queens, intended to produce fruit in May and June next year, have had all the suckers removed from them; they will not receive very much water at the roots with a dryish atmosphere and abundant ventilation. Of course the plants will not be what is commonly called dried-off, nor will the ventilation be so much that a greenhouse temperature would be produced; but at present the night temperature out of doors ranges between 55° and 60°, so that without artificial heat 65° as a minimum can easily be kept up. The suckers do not require any other artificial heat, except so much as may be obtained from the fermenting tan. The lights are closed early in the afternoon after the surface tan and walls of the house have been sprinkled with water. The young suckers are watered with caution until the roots have taken hold of the sides of the pots. A few plants of Charlotte Rothschild and Smooth-leaved Cayenne are swelling in the fruiting house. It is not convenient to remove those plants that have not yet thrown up, but if it could be done a treatment similar to that of the Queens would be desirable, the plants would then throw up in winter and fruit early for next season. Cutting over those plants that miss has been tried, but this is not always satisfactory; it answers sometimes when the tops can be plunged in a brick bottom heat, and extra attention be given to watering them.

### ORCHARD HOUSE.

All sorts of fruit are plentiful this season, but so far the flavour is not satisfactory, and amongst the early varieties split stones are not uncommon. Royal George Peach is now coming in, and the fruit of this is of large size and fair quality. In a few days Bellegarde, Violette Hâtive, Grosse Mignonne, and all other mid-season sorts will be plentiful. Hunt's Tawny Nectarine we have not grown in the house this year; it will not pass for flavour, but it is a certain cropper, and the fruit

when well grown has a fine appearance. It is very subject to mildew, so that it will probably not be grown again. Rivers's Lord Napier has again proved itself to be a sterling variety; the fruit is quite as large as Elruge, and it comes in a few days later than Hunt's Tawny. Stanwick Elruge, although it has not much of the Stanwick about it in appearance, is distinct and very good; it ripens with Elruge, and is also coming in. It is now necessary to withhold syringing altogether, and to admit air freely night and day.

#### PLANT STOVE AND ORCHID HOUSES.

The stove is being thoroughly cleaned-out and repainted. To do this it is necessary to remove all the plants to another house, in order that the woodwork may become dry before the paint is laid on. It is very little use painting a house at all if there is any wet in the wood, the paint prevents the moisture from getting out as effectually as it excludes it. Indeed it is a question whether paint is of any use to preserve the wood when a very high moist atmosphere is required. It certainly saves it from splitting by the sun; but decay is not arrested in places that are continually wet. If any substance could be invented that would exclude wet from the wood it would be a great boon to Orchid-growers and cultivators of exotic plants.

Insect pests increase very rapidly at this season, and should be carefully watched, else irretrievable mischief is done in a day or two. We have been much pestered with thrips on the Orchids this season, and it has required much care and perseverance to destroy them. They have attacked Cattleyas and Dendrobiums principally on the young growths. They hide quite in the centre of the growths, where they cannot be sponged-out. Even after being washed-out two or three times a week they still continue to appear. Persistent washing, however, ultimately destroys them. We use rain water and soft soap only. Fumigating with tobacco smoke destroys thrips, but it is very dangerous to use it in Orchid houses when the plants are making their growth, and at that time the insect does most mischief. It is well to fumigate freely during the winter months, or late in autumn after the growths are formed. White scale is also a very troublesome pest, and does much injury to Cattleyas, Lælias, and other Orchids that have the pseudobulbs covered with a thin skin fitting closely to the bark. The scale works between this skin and the bark, and cannot be destroyed until the covering is removed. Where the insects can be reached they are easily destroyed with soapy water. This insect is imported from the Brazils and other tropical countries with the Orchids. Red spider ought also to be mentioned, as it often does much damage to the young growths before it is observed. Many of the smaller Dendrobiums suffer from its attacks; if the plants are syringed daily this will hold it in check.

In the cool Orchid house the difficulty is to keep down the temperature without shading too closely. Our house is a small span-roof well exposed to the sun. A house of this character does very well in winter when all the light and sun possible is not too much. But if only one house is to be available for this class of plants, let it be a span-roof on a wall facing north. Odontoglossums adapted for the cool house are seldom attacked by insect pests. Green fly will make its appearance on the flower spikes and spoil the appearance of them, but it can be easily removed with a small brush.

#### FLOWER GARDEN.

The *Gladiolus* beds are in full beauty now—at least our own seedlings that have not previously flowered. The named varieties that have been purchased at considerable expense at different times during the last eight or nine years are very poor indeed, and the longer the roots are grown in our ground the worse they become; whether a change of soil would restore the leaves to a healthy green has not yet been decided, possibly it might. Many growers of this fine autumn flower complain of the unhealthy growth this year. We have been placing sticks to the spikes as they advance in growth. The heavy rainfall has saved us much labour in watering.

Hollyhocks we have not grown since the disease has become so prevalent. Sulphur will destroy the parasitical fungus that attacks the leaves. The spikes ought to be fastened to the sticks as they advance, and all decaying flowers be removed. The growths of Dahlias ought also to be trained to their supports; they are easily broken over at the neck with high winds. The same may be said of Phloxes and Pentstemons. How seldom one sees a collection of either in a private garden; but nothing can be better for decorative purposes in autumn, and they are so easily cultivated. The spikes must be tied to sticks as they advance. Late cuttings will just now be coming into flower.

Those who have still Carnations and Picotees to layer should see that the loam used is free from wireworms. A few of them had not been observed in the loam we used for ours, and they have burrowed into the centre of the stem where the notch was made and destroyed a number of our best plants. It is well always to layer more plants than will actually be required in case of accidents. In a few days we shall be busy putting in cuttings of zonal Pelargoniums, beginning with the Gold Tri-

colors, and getting in all the shy-growing sorts first. Verbenas and Calceolarias of the shrubby section delight in a dripping season, consequently they have made good growth this year. Roses that were budded two or three weeks ago have been looked over and the fastenings loosened. Placing sticks to Arsters, hoeing and weeding flower beds and borders, have occupied a portion of our time.—J. DOUGLAS.

#### TRADE CATALOGUES RECEIVED.

JAMES CARTER & Co., 237, High Holborn.—*Catalogue of Dutch Flower Roots, &c.*

W. CUTBUSH & SONS, The Nurseries, Highgate, London.—*Descriptive Bulb Catalogue.*

#### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

BASTYBURN—In the Devonshire Park.—August 19th. H. A. E. Samsell, Esq., 30, Hyde Gardens, Sec.

GLASTONBURY.—August 19th. Rev. E. Handley, Hon.-Sec.

PONTPOOL.—August 19th. Mr. Ernest Deacon, Hon.-Sec.

ULVERSTON.—August 20th. Mr. Geo. Higham, Hon.-Sec.

CONYNGHAM.—August 24th. Mr. Jas. Dickson, Hon. Sec.

HARTLEPOOL.—August 24th. Mr. Connellor H. Magor, Hon.-Sec.

NEWBURY.—August 24th. Mr. H. Seymour, Hon.-Sec.

ALEXANDRA PALACE.—Metropolitan Society's Autumn Exhibition, August 24th and 25th. Rev. H. H. Dombrain, Westwell, Ashford, Kent. Hon.-Sec.

BURTON-ON-TRENT.—August 25th. Mr. W. Shave, Sec.

ISLE OF THANET (ST. PETERS).—August 25th.

RAMSGATE.—August 25th. G. D. Smith, Esq., 8, Marine Terrace, Ramsgate, Hon.-Sec.

DUNDEE.—August 26th, 27th, and 28th. Mr. R. McKelvie, 51, Reform Street, Sec.

WAKEFIELD.—August 26th. Mr. A. Holmes (Parish Clerk), Sec.

CHIPPENHAM.—August 31st. Mr. Alfred Wright, Sec.

DEAL AND WALKER.—August 31st.

BATH.—September 1st and 2nd. Mr. B. Benson, 12, Wilton Street, Sec.

GREAT YARMOUTH.—September 2nd. Mr. S. Aldred, Hon.-Sec.

NOTON AND WHITWELL.—September 2nd. Mr. E. W. Berry, Hon.-Sec.

ALEXANDRA PALACE (International Fruit Show).—September 2nd, 3rd, and 4th. Mr. A. McKenna, Sec.

SOUTH OF SCOTLAND.—To be held at Dumfries, September 2nd. Mr. J. Bloom Dirriddle, 11, Buchanan Street, Dumfries, Hon.-Sec.

CENTRAL PALACE COMPANY.—Autumn Fruit and Flower Show, September 7th to 9th—Sec., F. W. Wilson. Boes and their appliances, September 11st to 13rd—Sec., J. Hunter.

#### TO CORRESPONDENTS.

\* \* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

NAMING FRUIT.—Our chief authority being away, fruit had better not be sent until a fortnight hence.

ADDRESS (Col. Milman).—The address of the Company is 21, Whitehall Place, London, E.W.

EARLY VERMONT AND LATE ROSE POTATOES.—J. Bates has these growing in his garden, and the tubers are so alike that he cannot tell one from the other. He wishes to know if they are different names for the same variety.

POTATO FAULTS (P. M. R.).—Your American varieties were destroyed by the soil or "new disease" to which they are liable. Dig in the maize manure at planting time next year. Do not add any other manure. Grow only Ash-leaved Kidney and Magd's Prolific, and take up the crop in July.

WINTERING ZONAL PELARGONIUMS (E. L.).—You may winter your plants in the frames from which frost is excluded by hot-water pipes, but we advise that the plants be potted. If planted out as you suggest there would not only be a greater liability of the plants being injured by damp, but a check would be given them at planting time, for this class of plants do not transplant well. In wintering you may trim-in any straggling shoots to make the plants compact and shapely, and remove entirely all the large leaves. This will admit air to the stems and render them less liable to be injured by damp, and will also afford more room. The plants may be as closely together as possible, providing the air can circulate freely amongst them. The number which you can accommodate will depend on the size of the plants. If you like to try the experiment of planting them out, put in 6 inches of soil and make it very firm, and keep it dry on the surface; but we strongly advise that the plants be potted, and in the end both time and plants will be saved. An important point to attend to is that the plants be taken up before they are in the slightest degree injured by frost.

MILDREW ON ROSES (J. L. R.).—The usual scourge—orange fungus and black mildew, owing to a sudden check in the growth, are on your Rose trees. Send us further particulars as to soil, situation, treatment, &c. Syringing with clear soot water, and dusting with flowers of sulphur, with liberal treatment of liquid manure in summer, and mauling with manure in winter, are the best remedies. If the growth in 1874 was such as you describe it, the trees will recover.

EGONARFUS GLOBULUS (Saxen).—The specimen sent us has the appearance of having been excessively watered, the stem being thereby destroyed. These plants in a young state are impatient of water overhead. Avoid watering on the stems, and use soil less rich.

**LILUM GIGANTEUM (L. B.).**—You will require to pot and grow on any offsets or young plants which arise around the parent, and under good treatment—i.e., shifting into larger pots as they fill with roots, and keeping well supplied with water during growth, affording them greenhouse treatment, they will flower before or by 1878.

**DOE ROSE STOCKS FROM STOOMS (Idem).**—The stocks will after a year's growth be available for taking up, and allowing about 4 inches of root stem to each they may be planted, and cut down to about 4 inches of the soil, and the following season they may be budded at or near the surface. Excepting in very strong soil Manetti stocks are far preferable to Briars for dwarf plants.

**ROSE LEAVES MILDREDD (H. G.).**—The dark parasitical fungus on the leaves may be prevented by copious waterings of the roots, and mauling the surface over them. Do so now, and give repeated syringings of the leaves, dusting them with flowers of sulphur after each syringing.

**GOLDEN-LEAVED PELARGONIUMS (O. L.).**—Golden Banner, Crystal Palace Gem, Pillar of Gold, and Cloth of Gold: Gold and Bronze are—Christina, Harold, Mrs. Harrison, Wain, and Prima Donna.

**LARGE-LEAVED HOLLY (Bac to Urbe).**—We think it is an extra-vigorous form of that truly noble variety, *Ilex aquifolium mobilis*, which is of vigorous growth, having a very fine appearance.

**ADRIOLA ORNAMENTA (Afred).**—As your *Adriolas* were reported in May, it would be better to leave any offsets on until the spring, and when you top-dress them if they are then rooted take them off, in the meantime taking care to have the earth well round the collar of the plant, so as to induce them to throw out roots. For the same reason leave the double plant of Colonial Taylor until the spring.

**VINES ATTACKED BY MILDREDD (H. G. A.).**—In your case we do not think you have anything to fear, only persist in the use of the sulphur whenever and wherever the mildew appears. In winter dress the vines thoroughly with 1 lb. of soft soap to a gallon of tobacco juice brought to the consistency of pebbly adding flowers of sulphur, and apply with a brush, taking care not to injure the eyes.

**GRAPES SHRIVELLING (A Subscriber).**—Whether the Grapes are shrank or the border is dry. In the former case the foot-stalks of the berries, also some of the main stems of the shoulders or other parts of the bunches, will be dried and become brown in colour, having a wire-like appearance, and the berries so affected are devoid of flavour even if the shanking did not occur until the berries are far advanced in ripening; and if it takes place when the Grapes are changing colour the shanked berries are sour. If it arises from overdryness of the border that may be obviated by keeping it more moist; but we apprehend the border has been all along too dry, preventing the Grapes attaining a good size and ripening off fully. The filling of the house with bedding or other plants is against the keeping of Grapes, as from the moisture resulting from watering the plants damping of the berries takes place, which is difficult to dispel in dull wet weather. The house may, however, be cleared of the Grapes when the leaves have fallen, cutting the bunches with a few joints of wood and placing them in bottles of water in a dry place, a few pieces of charcoal being placed in the bottles to keep the water sweet.

**VINES UNWATERED (E. F.).**—The leaves you sent us show the lower part of the shoots to be weak, and the upper part too vigorous, which is due in a great measure to the richness of the border; and the weakness at the lower part of the canes we think due to the border, from the waterproof covering, being dry, and the growth in the early stages weak. We presume you stop the side shoots at the sixth leaf, and stop the laterals at the first leaf, and the subsequent growth also at the first leaf. The laterals upon the cane you will have stopped at the first leaf, and subsequent growths keep closely stopped to one leaf. If this has not been done do it at once, and treat the vines now as if you were ripening-off a late crop of Grapes—i.e., leave a little air on at night, an opening at each light of about 8 inches, and with this air on have the night temperature 65°, by day 70° to 75° without sun, admit more air at 75°, having it fall when the temperature is 80° to 85°, and commence reducing it at 80°, closing at 75°, but leaving on the night air previously named. Continue this until the wood is quite brown and hard; this ought to be the case in a month, then lower the temperature 5° in each week after from fire heat, admitting air fully. The waterproof covering for the border may be all very well when you have Grapes, but the border may, when the vines are at rest, be too dry. In your case we should only cover the border in November with about 9 inches thickness of stable litter, and leave this on until the close of March or early in April, then remove all the littery part, and point-in what remains with a fork, not going so deep as to disturb the roots. In pruning, which do so soon as all the leaves have fallen, cut every other shoot to two, and the others to four eyes, and the cane cut back to one-third its length. Depress the rods in spring when the buds commence to swell. Upon the shoot which is cut to four eyes take one near its base for fruit bearing the year following, and from one or other of those above it you will certainly have fruit. Leave one shoot of those showing fruit as well as the one at its base, rubbing off the others, stopping the one at the base at the sixth leaf, and the other one joint beyond the bunch. Those cut-in to two eyes you know how to treat; and it is only for us to say that the upper shoot carrying fruit is to be cut away to the shoot next below it, thus giving you wood for next year's bearing, much nearer home than was the one removed. Keep the house cool in winter, not higher than 45° from fire heat, and the nearer it is to 40° the better.

**PLANTING VINES (A. M. B.).**—The vines should not be less than 8 feet 6 inches apart, which will give you ten vines for the length, five in each house. In the earliest house we should have two *MIL Hill* Hamburgh and one each of *Black Hamburgh*, *Duke of Buccleuch*, and *Foster's Seedling*. For the second house two *Muscat of Alexandria* and one each of *Madresfield Court*, *Mrs. Pine*, and *Lady Downe's Seedling*. The *Black Muscat* requires more heat to ripen it perfectly than *Black Hamburgh*; it ought to have the same heat as the *White Muscat*. Cane of a fruiting cane may be planted, but they ought not to be allowed to carry more than two or three bunches the first year. We prefer good-sized canes, and not allow them to carry any fruit the first season. Good canes of either description may be had of any of the principal nurserymen advertising in our columns. We cannot recommend dealers. It is a mistake to have only an outside border. The vines ought to be planted inside, having a border where it is only 8 or 4 feet in width; and to allow of the roots passing outside, the front wall should have openings about 2 feet wide, with a 14-inch pillar between, and washed over. The border should be the same in width as the rafters are in length, and the depth 3 feet 9 inches, 9 inches of which should be drainage, there being drains below the drainage to carry off the water, which should have a proper fall and outlet. The soil most suitable is the top 8 inches of a pasture taken off with its turf and chopped up in pieces 8 or 4 inches square, the soil being light rather

than heavy loam. Of this six parts, two parts old mortar rubbish, and one part each charcoal and half-inch bones, the whole to be well mixed together.

**FRUIT TREES (Robie).**—It would be all very well to procure a number of each kind of tree you propose cultivating, prove them, and propagate such as you find answer your purpose, had there been no previous workers in the same field, and by their experience able to give the information you are told to ferret out for yourself. There is no necessity for the procedure you are recommended to pursue, and we do not advise you to do so. If you wish for standard or large-growing trees, and have room for them, and are in no hurry to partake of the fruit, you may raise a stock of Apples and Pears from pipe, and Cherries, also Plums, from the stone; but if you want to keep them within reasonable bounds, and to have them to fruit early, they must not be upon the free stock, but the Apple upon the *Paradise*, *Pear* on *Quince*, and *Cherry* on *Mahaleb*. If you want large trees they may be upon the free stock, and the mode you propose of propagating them will answer, planting out the seedlings when a year old, and budding or grafting them when strong. We name a few of each kind of fruit suitable for garden as pyramids, bushes, or espaliers on the dwarf stock. *Apples*—*Dessert*: Early Red Margaret, Red Astrachan, Kerry Pippin, Margil, Cox's Orange Pippin, Ribston Pippin, Marmington Pearmain, Old Nonpareil, Syke House Russet, Kiddlestone Pippin, Malon, and Sturmer Pippin. *Kitchen Apples*: Keswick Codlin, Lord Suffield, Cox's Pomona, Blenheim Pippin, New Hawthornden, Mère de Ménage, Bedfordshire Foundling, Small's Admirable, Damsel's Seedling, Betty Gesson, Rymer, Warner's King, and Gooseberry Apple. *Pears*: Summer Doyenné, Beurré Giffard, Beurré de l'Assomption, Williams's Bon Chrétien, Beurré Superfin, Louise Bonne de Jersey, Doyenné Gris, Doyenné du Comice, Beurré Diel, Beurré d'Arenberg, and Bergamotte Espéren; Jargonelle and Marie Louise doing well upon the free or Pear stock. *Plums*—*Dessert*: Early Green Gage, De Montfort, Gullin's Golden Gage, Green Gage, Kirke's, Jefferson's, Transparent Gage, Guthrie's Late Green. *Kitchens*: Early Frolia, Belgian Purple, Prince Englebert, Victoria, Mitchellson's, Diamond, Autumn Compôte, and Belle de Septembre. *Cherries*: Empress Eugénie, May Duke, Royal Duke, Belle de Choisy, Garnation, Kentish, Elaine Horsens, Late Duke, and Morello.

**PRUNING LORD SUFFIELD APPLE (C. W. D.).**—Cut back at once the main shoots or the continuation of the main branches to 10 inches just above a leaf; the main shoot or leader to 12 or 13 inches. If you require to form new branches these should not be nearer to each other or those existing than 1 foot; and stop, or in your case cut all the others back to three leaves, and afterwards stop to one leaf, so that growth may result. It will admit light and air to the fruit and spurs; upon the maturing of the latter you will be dependant for future produce. If any overcroding has resulted by the neglect to which the trees have been subject, thin-out the crowded parts at the winter pruning, and attend to stopping earlier another season.

**NECTARINES CRACKING (A. B. C.).**—The air in your orchard house is probably too dry. The skin of the fruit does not expand sufficiently fast to contain the flesh of the fruit as it increases in growth.

**CHERRY SHOOTS BLIGHTED (L. J. K.).**—The shoot sent is covered with a black fungus, a result of the attack, at an earlier stage, of black aphid, which might have been destroyed by dipping the shoots in tobacco water. Shorten the shoots, cutting away as much as possible the infested parts, and take prompt steps another season to prevent a recurrence of the mischief.

**MELON WITH MALE FLOWERS ONLY (Rev. S. A. B.).**—As a rule the male precedes the female flowers by several days, the former appearing upon the main shoots, whilst the female are for the most part borne by the side shoots at the first and second joints. If there be no female flowers upon the side shoots they being male flowers, the plants are in much too loose soil, and the growth is very free and long-jointed. We think, however, your plants are late, and that you will in a few days have female as well as the present and other male flowers. The present season has been a very trying one for Melon growers with only indifferent means of affording artificial heat.

**NO QUONUM IN A COLLECTION OF VEGETABLES (T. J. H.).**—We know of no reason why it should not be so exhibited. It is a culinary vegetable.

**SALINE MANURE FOR POTATOES (C. R. Goddaling).**—We should dig in the manure at planting time.

**NAMES OF FRUITS (T. F.).**—Beurré Giffard. (*A Connaught Subscriber*).—No. 2 appears to be Nectarine Plum. 1 was smashed. We cannot undertake to name Plums without a shoot and leaves accompanying the fruit.

**NAMES OF PLANTS (O. O.).**—*Veratrum viride*, L. (*Rev. Denis Moore*).—One of the American species of *Crotalaria*. (*An Amateur*).—1, *Polypodium vulgare*, var. *cambriacum*; 2, *Fellina rotundifolia*; 3, *Sceloporus vulgaris*, var. *crescens*; 4, *Ditro*, var. *multifidum*; 5, *Ditro*, var. *angustifolius*; 4, *Polystichum angulare*, var. We only name six specimens at one time. (*A. J.*).—1, Too withered; 2, 3, and 4, Merely bits of spray and leaves.

## POLTRY, BEE, AND PIGEON CHRONICLE.

### CATALOGUES.

We do not think secretaries and poultry-show officials pay as much attention to the catalogue department of our shows as they should do. Loud and frequent are the complaints we have about the non-arrival of catalogues on the proper day, and often of their never appearing at all. We have had two letters from gentlemen this week. One living in Kent writes word, "Do say something in our Journal about catalogues. The system gets worse and worse. I wrote and asked the Secretary of the M— Show last week for a catalogue, and begged him to send it by return for an especial reason, and it never came to hand for five days, and the report and prize list had then appeared in the papers." We take also an extract from the other letter. "Please, if you attend S— Show send me a catalogue, for I have given up writing to the shows for them, as they either send them too late to be of any use, or bag the stamps *in toto*."

Now these things should not be, for really to the great body of exhibitors who do not attend the shows, and who send their birds on as parcels, a catalogue is of the greatest possible service and importance. We really do hope something will be done to

remedy this growing evil. If the secretary or one of his myrmidons cannot personally see to the dispatch of the catalogues by the first post, let the printer or someone else do it, and the fact stated in the schedule; stamps could then be sent to this vendor, and he would be responsible for the dispatch of the catalogues. We know from experience that it needs a superhuman effort almost on the first day of a large show to see to the catalogues; but the matter being really so important, we do hope secretaries will try somehow to send them, or else, as we said, appoint some other responsible person to do it, and so stop the great inconvenience to exhibitors and consequent annoyance to everyone connected with the show. We know, of course, full well some do send the catalogues off at the proper time, and many of those from large and important shows; so, surely what one can do all can do. We always make a note of the exhibition which sends its catalogues and prize list regularly, and for regularity in doing so for the last five years we give the palm to Aylesbury, Royal Counties Association, and Northampton. We do not intend to be invidious in naming these, for doubtless there are many exhibitions with which we have had nothing to do have kept their faith as far as catalogues go with exhibitors, but those three shows named above have, so far as we are personally concerned, been the most regular during the past five seasons.

Then as to the printing of the awards in the margin of the catalogue in the line with the exhibits; we do not hesitate to say we would gladly give 8d. each, or even 6d. more for every catalogue so printed. We know it cannot always be managed, but when it can be possibly we do hope no effort will be spared to manage it. We are sure gladly would exhibitors and purchasers give 8d. or 4d. more to have them so. When this cannot be done anyhow, then the next best way is to have a list printed of the winners' names and inserted in the catalogue, so that the names of the prizewinners and those getting commendations can easily be seen. The slovenly way of merely printing a list of numbers on a sheet of paper is horrible in the extreme, and we cannot say too much against it. The numbers, too, are so often wrong, as of course it is much easier for mistakes to occur among a list of numbers than when we have the names in full; but apart from this, to have to find first the number and then search it out in the catalogue is worrying and tiresome.

There is, however, one thing worse in connection with catalogues which we have often experienced; we allude to the system of sending catalogues with no awards at all. This is especially done at the one-day northern shows, and is positively intolerable. Whatever use can secretaries imagine a catalogue without awards is to a person at a distance? and yet time after time from Lancashire, Yorkshire, and even the more midland shows we have had them. Surely if the show funds do not allow of a prize list to be printed, or there is no time for doing it, the secretaries or officials should have the sense to mark at least the awards in the classes their patrons from a distance are interested in, and not send them a catalogue which makes them no wiser than they were before. Even if the local paper, which always somehow crops up on the evening of the show day, was sent, it would be much more useful than an empty catalogue. We hope we may never have to allude to this again, and that this ridiculous plan may at once be discontinued.

Next one word as to the quality and price of a catalogue. We said above we would gladly pay more to make the dispatch of a catalogue by a fixed post certain, or to have the awards printed in the margin, and so we would; but when this is not done we think 6d. an ample sum for a catalogue of a moderate-sized show, especially as some—e.g., St. Austell, Oundle, &c., only charge 8d. and 4d. The Palace, Manchester, and those large exhibitions who get up the whole thing well are, we consider, warranted to charge 1s.; but a catalogue we had last winter from Kendal certainly was the dearest shilling's worth we ever had in the catalogue way.

Talking of the price of catalogues reminds us of an incident which happened this year at the Bath and West of England Meeting at Croydon, which we may as well set our readers on guard against. We got out at Waddon station, and immediately saw a man with a pile of catalogues on sale. "How much?" we cried. "One shilling each," answered the man, and we bought the book and went to the Show. When we got there we saw the catalogues selling at 6d. each, the price being plainly printed on each wrapper. We looked at ours, and lo and behold the "price sixpence" had been beautifully erased and no signs of it left. We sorrowfully wondered how many sixpences the man made by his dodge.

Then one word about the A and B entries—e.g., 9A or 9B, and so on. These should never be used if possible, for beyond showing the entries have been slovenly kept, or that entries have been received beyond the proper time, they often are the cause of much confusion and annoyance, for the pen man comes, erects his pens and numbers them, and the birds arrive. Presently, say, 9A comes in; pen 9, and next to it pen 10 are found, but 9A appeareth not. Then a pen is erected in some out-of-the-way corner, hastily numbered 9A, and the contents of the

basket put in, or, perhaps, they are placed in some empty pen where the proper inhabitants have not turned up. The Judge comes round and judges, and not seeing 9A they get *nil*, and yet, may be, are the best birds in the class; while the unhappy owner at home, knowing not the reason, uses unpleasant words about the Judge which passed over his birds, which perhaps, too, are champion winners. This is not always the case, but we have known it happen more than once, and it must be guarded against.

Perhaps some will consider this a long article on a very trifling subject. We think otherwise, for we are certain that nothing connected with our shows wants attention more than the present system of the dispatch of catalogues; and, moreover, that there is nothing so valued by the majority of exhibitors as a well-got-up catalogue with clearly-printed prize list arriving by first possible post after the awards are made. Having said thus much, we leave the matter in the hands of the secretaries, and do hope the present season may be marked by an improvement in this respect; so that as we called last year the "triumph of the double baskets," so this year may be known as the one chronicling the improvement in the catalogue arrangements of our shows.—W.

### "BLACKS" IN FOWLS.

A few years ago the north of England was noted for its cock fights, mains being fought on all public occasions. Speaking to an old "pitter" the other day, he remarked that one-half of the diseases to which fowls are now subject would be avoided if the owners would but resort to a remedy which, in his young days, was about the only one used when the birds were noticed to be unhealthy. For what is locally known here as "blacks" in birds no other specific has been found so salutary. Take a little rue fresh from the plant, pound it, and mix into a pill with soot, open the bill of the bird, and shove it into the crop. If given occasionally when the birds are in ordinary health it is a capital preventive of disease.—BETA.

### MANCHESTER AND LIVERPOOL POULTRY SHOW.

This was held at Preston, August 10th, 11th, and 12th. The chickens were unusually good.

In *Dorkings* first and third were good pairs of large build and good in claws, second a fine cockerel, as was the same owner's unnoticed birds. This was a capital class. In *Spanish* the winners were a very old-looking pair, and it was the general opinion that they could not possibly be birds of 1875; second were good though coarse; third a nice neat pen of promise; the remainder also good. In *Buff Cochins* the winners were superb, the pullets especially being grand in size, colour, and shape; third a grand pullet, and a nice cock not so good in colour. Partridge were more numerous. First, a fine cockerel of good colour, the pullet was a real gem of splendid quality; third not so nice a pullet, but a very Cochins-like cockerel of great merit; second were a nice pair but hardly so perfect as the others. Dark *Brahmas* were good, though, perhaps, not so perfect as last year. First and second cockerels were beautiful in colour, but a little wanting in symmetry. Third cockerel too heavy in leg feather; pullets all nice. Light *Brahmas* were very moderate, and a poor entry. *Games* were poor throughout, the only pens deserving notice being the first Brown Reds and the first yellow-leg Piles; both pairs being good in colour, head, and shape. *Hamburgs* were certainly a grand lot, and the competition severe. In *Golden-pencils*, first went to a pair, the cockerel rather a plain bird, but the pullet one of those beauties which come out so seldom; second a neat pair, the cockerel light in colour, both good otherwise; third a moderate cockerel and a fair pullet. Some of the other pens contained one good bird. *Silver-pencils* were a grand lot; first and second showy in tail and neat in head, but inclining to be yellow; third a grand tail and nice colour, but the cockerel too full of marking. Mr. Beldon's were two capital pairs. In *Golden-spangles* the first and second were capital in colour and marking; third too patchy in spangling and lacing, and the cock rather light. In *Silver-spangles* the first cockerel was not our fancy, a fine bird, but plain pullet very finely spangled in the body; second was a beautiful cockerel too dark in the neck, but splendidly marked, pullet good; third a fair cockerel, but pullet light in neck. Mr. Fielding's pair were the best throughout, but the cockerel too light in his legs for the Judge. In *Blacks*, first a capital cockerel indeed, but the pullet minus any point but ears, which were good; second and third were capital all round, and must have been close upon the first. In *Poles* first and third were fair White-crested; second, *Golden-spangled* of great merit, but the pullet was rather high in the back or they must have won. In *French* first went to Houdans, the pullet a beauty, but the cockerel decidedly poor; second were *Oréves*, the cockerel also very poor, and the pullet though good in size was poor in crest;

### IBLE POULTRY SHOW.

Two seasons have elapsed since a show was held at Idle, and previous to this the annual meeting had attained a fair stand among the events of this part of Yorkshire; but through the irregularities of some in connection with the management the Show was given up, but this season has been established fortunately in good hands, so that we think a good future is in store for the Society. The cricket field was well chosen for the purpose, and pens on Turner's principle were used, but no tent provided, the pens being placed in a square in the centre of the field, but fortunately the weather was fine, else the birds must have suffered from the exposure. The entries were not as large as would have been the case had it not been for the occurrence of other shows, especially the one at Oldham, those for poultry being ninety, and for Pigeons eighty-four—a result we must after all confess was a great disappointment to us. The whole was well managed, and the number of visitors very good.

**Spanish** were very good, and all old birds. **Game** had four pens, the first Black, and second Brown Reds; Mr. Mason's highly commended pen of Black Reds very good. **Cochins**, one pen of Buffs. **Brahmas**, first Dark and second Light. **Hamburghs** not numerous but good. In Gold-spangles the awards were reversed from the Great Horton Show, and the timepiece awarded here. In Game **Bantams** first were Piles and second Black-breasted Reds; and in the Variety Blacks won, the first very small. Gold and Silver **Polands** won in the Variety for large fowls. In Game cock chickens Brown Reds won, and these were very promising birds; the pullets were also of this colour. In the following class Partridge were first and Buffs

second, but we should have reversed these awards. Pen 1, very highly commended, Whites. In chickens Hamburgs are not forward, and some time must elapse ere we can feel at all certain the quality is aught approaching previous years, though there were some good birds here.

**Pigeons** ran very good in some classes. Of Carriers there were no entries, and of Barbs only one. The winning Jacobins were Reds and good. Dragons only one pen. In Tumblers, Long-faced, first were Red and second Black Mottles, a good Black Bald highly commended. Turbites were an easy win for Miss Scanor, first with a Red and second Blue. English Owls were a fair class; first Blue and second Silver. Antwerps were a great disappointment in numbers, for in this locality large numbers are kept. The cup was given to a very handsome Short-faced Dan cock, the second in that class being also of that colour. Short-faced hens are not near the quality of cocks, although in colour no improvement can be effected. Long-faces were very good, and the winners well placed. Medium-faced were good, very good; in fact, we considered these the best of the Antwerp classes. The cup for Pigeons except Antwerps was won by a very pretty White Owl, the second in this class being a Black Pointer. In the Selling class Black Barbs were first and Blue Owls second.

**SPANISH.**—Black.—1, H. Bolton, Sturley. 2, J. Thresh, Bradford. 3, F. Bowdler, Thibis, Wotton.

### BORNINGLOW POULTRY SHOW.

This was held on August 7th. The weather was most disastrous for this Show, which was a very pretty little affair, the quality of the birds being unusually good.

In **Dorkings** first was a fair old pair, second and third moderate. The winning **Cochins** were all good, the first richest in colour. In **Dark Brahmas** first was a good pair, second fair chickens; the rest poor, two pens being empty. In **Light Brahmas** first and second went to chickens, the first excellent in size and feather; third two old birds. In **Spanish** first were a capital pair of chickens. The first **Brown Red Game** cock was not in good trim. Duckwings were a much better lot, first going to capital old, and second to grand young birds. In **Spangled Hamburgs** first were plain Silvers, second Gold, cock good, but hen poor; third to grand Silver chickens. This was a capital class, and the third might easily have won. In **Pencils** first went to a grand pair of Silvers in excellent feather, second to first-rate Gold, and third to Silver chickens (since first at Preston), good Golden being highly commended. **Game Bantams** were a neat lot. First were rich and stylish, second a better pair we think, both Black Reds; third Piles of fair quality. Other than **Game Bantams** were fair; first fair Black, second pale Gold-laced, third the best pen in the class (Blacks). In the **Variety** class first went to neat Black **Hamburgh** chickens, second to old Blacks decidedly before them, and third to fair **Créves**, a better pen of **Houdans** being highly commended. There were a few pens of decent birds in the **Selling** class.

We would advise the Committee to add Pigeons another year; with a judicious prize list they should pay their way well.  
JUDGES.—Mr. Teebay.

### HETTON SHOW OF POULTRY, &c.

THE sixteenth annual Show was held in the Hetton Hall grounds on the 11th inst. No place we have had the pleasure of visiting in the county of Durham is equal to these grounds for the purposes of a show and gala; and though Hetton is comparatively isolated, yet the number of visitors is immense, and fortunately on the present occasion the weather was quite enjoyable. The prize list had been improved in value, but public notice not having been drawn to this fact, the entries were not greatly in advance of those of last year, the entries in all being 210. The pens were the substantial ones of the Society, which, however, it would be well to discard for those of more modern construction, which would occupy less room and present a more pleasing and uniform appearance.

There were two sections in poultry, one for old, and the other for young birds. In *Spanish* the hens were very good, and cocks moderate. *Dorkings* good; but *Cochins* uncommonly so. In *Brahmas* the hens were faulty, but cocks were well marked and shapely. In *Hamburgs* most of the winners were really good. In *Polish* first were a neat pair of White-crested Blacks, and second and third Silvers; the cocks in the latter very good. *Bantams* were a very good section, some of the Game being especially stylish and good. One pen in the old birds was disqualified, a pullet being shown as a hen. Blacks were first and second in the Variety class, and Nankins third. Many other pens noticed. *Ducks* were a rare section for quality; the first in Ronens and Aylesbury very large. In the Variety Pintails were first and second, and Teal third. In the Variety of poultry first were Houdans, second Black Hamburgs, third Orpingtons. In chickens there were no entries for *Spanish*; *Dorkings* good. In *Brahmas* first were Dark and second Light, good and well grown. In *Hamburgs* the Gold-pencils took the lead for both quantity and quality, these being good in all respects. The rest of the *Hamburgs* were but moderate. Game poor; but *Bantams* good in all sections; the first Black Reds in Game, and first Black Rose-combed, about perfect. Of *Polands* one pen. In the variety class *Cochins* won the prizes.

In *Pigeons* only the Pouters, Almond Tumblers, first-prize Jacobins, Dragons, and the winners in the Variety class were very good. In the latter class Silver Dun Antwerps and Ice Pigeons won the prizes.

*Rabbits* were in pairs, each having a division through the pen. The Lops were good; but the Variety class brought nothing of note, the winners being Silver-Greys, which will, however, be pretty good when out of the moult.

### CAPTAIN HILL'S BANTAMS AND PIGEONS IN THEIR HOME AT HALING.—No. 2.

Now, though possessing, as we have seen, valuable and rare Bantams, it is as a Pigeon fancier that Captain Hill is chiefly known. Like many amateurs who really love their birds, he is only a winter, or occasional exhibitor. In judging of the number of breeders of valuable Pigeons we must always remember that first there is a large number of fanciers who will not show their birds on any account, and these are among the truest fanciers, and often hold a good social position. They are not smitten with the love of prizes, and prefer having their pets at home enjoying themselves, and they enjoying their pets. Then there is another large class, who show occasionally and only in the winter, who will not break their pairs or harass their birds to death by railway travelling, and of whose stock not one could be said to be suffering from that cruel-man-caused disease "over-shown." Among the latter class of fanciers and occasional exhibitors is Captain Hill.

Leaving the Bantams strutting about in their glory on the sunny side of the buildings on the inside of the right angle, I proceed to inspect the Pigeons which are, as one might expect so near London and away from the owners, kept shut up. The stables are numbered, and as a rule may contain, for aught I know, splendid cattle—here a match pair, there smart riding horses, here ponies dear to children's hearts; but in Captain Hill's stables the inhabitants are much more numerous, being hundreds of Pigeons. Turning the key we enter, and I find each stall wired-in, and with all the fittings up of a complete Pigeon loft. It must be borne in mind, too, that in a London or London-like mews there are rooms over the stable in which the coachman and his family reside: these rooms are also devoted to and inhabited by Pigeons. But I am as yet at the entrance of the stable. In two of the stalls are excellent Dragons, some of the London, others of the Birmingham style, happily and rapidly uniting and producing a better style—namely, the composite style, or show Dragon of the future. Partisans of each extreme variety have shaken hands, each saying, "Brother, brother, we were both in the wrong." London brother saying, "I was wrong about that thick head and over-large Carrier-look in my Dragons." Birmingham saying, "Well, my birds were a trifle too Skinnum-like, and were rather fit for flyers than for the show pen." Captain Hill possesses excellent Blue Dragons, good Whites, and Reds and Yellows of Mr. Betty's strain, forming altogether a fine sight.

Passing the stalls I come to the loose box, which was full of feeders. The harness room contains some invalids, particularly a Black Carrier hen afflicted with that strange disease, the meagrim—affliction of the brain doubtless. The coach house contains Pigmies Pouters. To these birds Captain Hill has devoted six years' study and experiment in order to breed them to the standard colours of their larger brothers, together with leg-feathering—in short, to make them perfect high-class Pouters in miniature. In this endeavour, or rather in realising his wishes, Captain Hill has, as yet, been only partially successful; still, he can report progress. In the same loft—no, coach house—I saw excellent Magpies and good Blue Carriers; also true Antwerps, not Barbs-cum-Antwerps; also Cumulets or White Eyes, a variety of Pigeons which, for flying, Captain Hill thinks, from former outdoor experience of them, unequalled. It is a German-bred bird, or probably from the Netherlands, and has the finest, clearest pearl eye of any Pigeon, and hence its second name, White Eye.

Having gone through the ground-floor rooms—stalls, loose box, saddle room, and coach house, I now ascend the staircase. On the landing are numerous prize cards—trophies of victory. Then comes the coachman's sitting room, where one would expect to see the coachman's comely wife, with a baby in the cradle, and two older children, one a boy making a chair into an imaginary carriage and pretending to take his sister out for a drive: coachmen's children are specially given to this kind of play. But no: no pouting wife, no noisy children there, but in their place Pouters pouting from pleasure, not temper; and quiet Pigeon-pairs of juveniles in their "procreant cradles," as Shakespeare calls the nests of "temple-haunting martlets." Before me is a Red Pouter cock, seven in limb and nineteen in length, with a wonderful crop and the darkest tail I ever saw, so stained with red that one would imagine it to be almost possible to get a real red tail; but that I suppose cannot be. He is well matched to a hen of even darker body colour than his own. I note, too, a Blue cock, a young bird perfectly marked, and a Yellow of good colour; also a White hen, formerly Mrs. Ladd's of Calne; a Mealy hen second prize at the Palace, and a grand Black cock and Mealy hen. I am amused with the room. Over the fireplace, boiler and oven—that oven in which the coachman's supper was to be kept hot, perchance a remnant of

Pigeon pie—were boards, and on them Pouters cooing and young birds hatching. Next the coachman's bedroom—(I really feel as if I were writing a household-furniture catalogue, and feel prone to add "containing tent bed with dimity hangings)—but recollecting myself, as school girls say, I look around, and am told that this is the variety room, and an uncommonly good variety class are in it. There are first Jacobins, famous Blacks, of raven plumage—the most telling colour in Jacks, save that the rose shows best in Yellows. There were also excellent Reds and Yellows. Nuns, too, of the usual colour, the black-headed; and of the unusual colours, red and yellow-headed. Priests, too, and more Dragoons, and Archangels of an unusual marking—viz., with white heads and flights, which look as if they might be related to Priests. This is a variety which was mentioned by a Mr. Furer in 1858 as having been seen by him in some parts of Germany. Mr. Tegetmeier quotes his words, which are as follows, "Besides the Red, and Black, and Yellow, and Blue there are several varieties, as, for instance, those having white flights either with or without a white spot on the forehead; but those with a clear white head and flights are most prized." Such are Captain Hill's, and very pretty birds they are, to my mind much prettier than the other Antwerps. Among the Jacobins were some Reds of a very solid and rich colour. The variety room had also in it some Black Beards; Black and Chequer Smerles, the supposed original Antwerps, some with a little touch of Owl-like frill—very quick active birds, giving token by their indoor activity of their outdoor powers.

I next enter the back parlour, devoted to Pouters, Reds, Blacks, Blues, and Yellows. Here was the old champion Blue with a splendid hen matched with him, one of the best in England. I notice also a Black hen with good rose pinion, and a Black cock, a very perfect Pouter. I have mentioned in these stables (for there are others to inspect) only the cream, for the birds are so numerous that it is impossible to mention more than those that are most conspicuous to the eye from their special beauty.

Having now seen the inhabitants of the stable proper, I am taken to see the birds which Captain Hill calls his "rough lot," kept in another stable of similar external appearance; but on opening the door I find the building unfinished, the divisions made, but the living rooms not ceiled and ready for a family. In the ground floor of the stable proper is the place for the Bantams; there they lay, and sit, and sleep. Above, with much wing room, the space being open to the slates, are the Pigeons, which fly from rafter to rafter in much enjoyment, and though called a rough lot would not wish, I am sure, to exchange their wider range for the closer-penned superior birds in their grander home. Do we not sometimes see the like to this among mankind? Ah! we do many a time. Amid the rough lot there are some good birds, Gumbles of different colours and Smerles; and in the back parlour, a little separated by netting, I found good Pouters of the two colours Red and Yellow, and a perfect model of a Black hen.

Such is a brief outline or slight sketch of Captain Hill's two pigeonries, situated at half a mile or so from his house, the distance affording a nice walk, and the Pigeons forming a nice object at the end.

Captain Hill is an old fancier, and told me that one of his greatest griefs in early boyhood—a grief which he remembers so well—was his losing a favourite Almond Tumbler, seeing his bird seized upon by a cat and being wholly unable to rescue it. Boyhood's griefs are photographed on the memory, and, like childhood's tears, are very bitter.

"Edina" is full of Japanese curiosities, amongst them two Japanese spaniels, no doubt the original, as Sir Rutherford Alcock supposes, of our King Charles dogs. With us in process of time the King Charlie has been altered, I may say for the worse, and the dogs of the breed now exhibited are black and tan with no white in them. In King Charles's time they had much white and were a great deal prettier. In proof that they had much white I refer my readers to our vol. xxiv., page 58, January 16th, 1873, where is a picture of John Rose presenting the first English-grown Pine Apple to that king. The dogs with the king in the picture have more white in them than black; so of other pictures of the dogs of that and near succeeding days. No one seeing Captain Hill's pair of dogs, soft and silky in coat, and rich black and white in colour, will dispute the point with me that modern fanciers have spoilt the dog by breeding-out the white. Dog fanciers seldom have an eye for beauty, but delight chiefly in what is difficult to attain, no matter how ugly it be when attained. Witness the King Charlie, the pug, and the prize black-and-tan terrier, which is scarcely a terrier at all. I hope the fox terrier will always be judged by his true merits or proved capacity for work, and then the half beagles will disappear, and the true fox terrier be kept.

Captain Hill may well be congratulated on his Bantams, Pigeons, and dogs, and I congratulate myself on a most agreeable visit. The pleasant air and view at "Edina," the sight of the beautiful birds, the stroll through the hay, the visit to the antique and picturesque little toy of a church near, "Perivale

church," and most of all—above all, the real kindly Scotch welcome, make my two days at Baling as pleasant to look back upon as they were to me when there.

N.B.—If a reader has a stable and coach house and no horses, a good thing now that hay is £3 a ton, my advice to him is to fill them with Pigeons.—WILTSHIRE RECTOR.

### DRIVING BEES.

"LINA upon line, precept upon precept," is an old text upon which many a sermon has been preached. How often has the process of driving bees been explained in these pages, with the utmost minuteness and particularity! yet the question recurs again and again, "How is the operation performed?" When once the practice now adopted at some horticultural shows—as recently at Grantham—becomes common, of performing various bee manipulations in public, doubtless an answer to the question will be readily found without constant recurrence to the authorities of our apian journals; till then we must not shrink from reiterating information. Once seen performed by a master hand, anyone gifted with coolness and perseverance will find driving bees a very simple operation. Of course "practice makes perfect."

In my own case I discard much of the paraphernalia which I once thought necessary, and am content with nothing more than some sort of bee-dress, a little smoking brown paper, and an empty box or skep to fit the hive which is to be driven. I begin operations by blowing a steady current of smoke in at the entrance of the hive, which immediately drives the bees up among the combs in a panic of fear. From that moment they are absolutely at my mercy. I proceed then to break the hive from its board, and to turn it upside down upon a chair or pail—anything to steady it. A whiff or two more of the smoke blown in among the combs finishes the courage of the bees, already sufficiently alarmed at the treatment they have received and their sudden exposure to the light.

The empty box or skep is now brought into requisition, and is gently placed over the reversed hive, after which a few taps smartly given to the sides of the hive will cause the whole population, queen and all, to ascend into the empty chamber overhead. A mighty hum is heard at the moment of the rush, which may last a minute or more till the bees are assured of the safety of their queen in her place of exile. When this has toned down to something like silence I lift off the once-empty box, now full of bees; and if I see that most of the bees are in it I put it gently on the stand where the old hive stood, while I proceed to drive out the remainder of the bees into another empty box or skep of similar dimensions. These I carry to their companions on the old stand, and dash them down on the top of it. The parent hive thus emptied of its inhabitants is now ready for any treatment that may be desired. The driving part of the business is done. As for the driven bees they, too, are in the hands of the bee-master to be dealt with at his pleasure, either for transference to a permanent hive like an ordinary swarm, or to be treated otherwise *ad libitum*.—B. & W.

### A SAD CASE.

THE Rev. L. L. Langstroth of Ohio, the author of the best work that ever was written on the honey bee, and the simultaneous inventor with Dzierzon of the frame hive, is prostrated by poverty and sickness, having been even compelled to part with all his bees. This unhappy result appears to have been in a great measure brought about by worry and litigation in defending his apianian patents. The bee-keepers of America have this present summer subscribed both bees and money once more to start their old friend in his favourite pursuit. May their good intentions prosper.—J. HUNTER.

### THE HONEY SEASON IN HEREFORDSHIRE.

PERHAPS it will interest the readers of the *Journal of Horticulture* to have a *résumé* of the experiences of a bee-keeper in the west of England during the past honey season. I say the "past" advisedly, seeing that all honey-gathering ceases in this district when the lime-tree flowers are gone.

Up to the 1st of June or a little later "all went merry as a marriage bell," and a large glass super was taken off full of the most beautiful honey, and a large glass super which was intended for exhibition at the forthcoming show at the Crystal Palace was rapidly filling, many of the cells in fact being sealed. I even had an utopian idea that I might gain a prize, but since that date not an ounce of honey has been gathered. All hives and supers have been decreasing in weight, and so rapidly that it might be midwinter instead of summer. Several swarms were in the last-stage of existence for want of food, and dozens kept in the old-fashioned skeps by cottagers in my neighbourhood have died outright for want of timely feeding.

My hives have indicated their poverty by throwing-out the

young bees from the cells in the pupa stage, and general robbery and anarchy prevail in the apiary. Where I could count last season on having hundreds of pounds of honey, I cannot count on tens. A cottager's bees, which I took the other day in order to save them from the sulphur pit, had scarcely any honey, and the poor bees were, of course, in the small skeps; and most difficult it is to impress upon the cottagers here the utility of larger and better hives. They will not believe in the well-known fact, the larger the hive the greater the population, but I hope in time to get them to give larger and better homes to our hard-working little friends.

I shall at once begin feeding actively, and thus save many hives, the fate of which would inevitably be death long before the winter, and I would strongly advise bee-keepers to weigh and feed if necessary at once.—H. W., Ross.

### AN APIARIAN INCUBATOR!

THE latest idea of our go-a-head friends, the Americans, is to hatch bees by steam; not from the egg as we hatch chickens, but from the pupa or chrysalis, and it is meant to be applicable for queen-raising only. The apparatus is styled a "lamp nursery for hatching queens." It is a double hive made of tin, with a space beneath the walls to hold water. A kerosene lamp keeps the water at the desired temperature of 80° to 100°, at an expense of about a halfpenny per day. The maker facetiously says, "Without a doubt the machine would hatch eggs (perhaps it would also scratch food for the chickens, we haven't yet tried it); but it hatches everything in the bee line quite satisfactorily." The mode of operation is described as follows:—A clean workcomb is put into the hive containing the queen it is desired to breed from, who stocks it with eggs, and when these are found to be hatching the frame is put into a strong queenless colony having no other brood; queen cells, many or few, are at once formed. The operation is repeated every three days, and as soon as the cells on any comb are found to be all capped over the bees are brushed off very carefully (avoiding shaking), and the comb transferred to the lamp nursery. As the queens will all be hatched before any working bee, no bees need be at any time in the nursery.

When the queens are expected to emerge the nursery must be examined several times a day, and as soon as found the young queens must be removed, and it is said if put among any bees that have no queen they will not and be received precisely as if hatched there, provided they have never seen other bees, and have been hatched but a few hours. To make a colony with such a queen it is only necessary to lift out about one-third of the bees, combs and all, from any strong hive, and drop the queen among them or let her run in at the entrance.

Our notions of how the young queen would be received by such a newly-deprived section of a stock is rather different. I should have expected her majesty would have been at once taken into custody if not executed as an usurper; but it may be the queen's virginity stands her in good stead. The experiment is at any rate worthy of trial, and the first opportunity I will put it to the proof, although I won't promise to set up a "lamp nursery" this year.—JOHN HUNTER, *Baton Rise, Ealing.*

### OUR LETTER BOX.

**FOOD FOR DOVES (J. A.).**—The best food is buckwheat, wheat, and Canary seed, though they will eat almost any kind of small grain or seeds. Do not give tares, as they are fatal to them. They are very fond of hempseed, but it must be given sparingly, or they become fat, unhealthy, and lose their feathers.

**CANARIES AND THEIR COMPLAINTS (M. L., a Subscriber).**—Canaries are subject to asthma, but when so afflicted they are better separated from healthy birds. When kept together each has to drink out of the same vessel, and it is far better to prevent other birds from becoming afflicted with so distressing a complaint. It is just possible the other birds might not take the complaint. Being in a room which is low and near the slates, the present weather in particular would not cause the bird to suffer; but a draught or current of air would more likely injure the birds. Generally Norwich birds are as free from illness as those of any other breed. Give your afflicted bird now and then a drop of cod-liver oil, and let it have occasionally a bread-and-milk diet. Keep it in a cage alone with a cover over it.

**TREATMENT OF CANARIES DURING MOULTING (Blue Bell).**—Thistle heads will not harm your young Canaries. The seed is more beneficial, just now in particular, to Goldfinches. The occasional baths during moult will tend much to invigorate your Canaries during the moulting sickness. The water will assist in keeping the feathers in good trim, and encourage the budding of the pin-feathers. The ten Canaries (if all male birds) will learn to sing just as well as though they were separated. If they agree well together there will be no necessity to part them this side of Christmas. If you require exceptional songsters, and the young are under a good tutor, you can select one or two and place in single cages side by side.

**BEES NOT IGIURIAN (C. T. Salisbury).**—The bees you sent are not pure Igiurians; indeed, they have no marks or red bands indicating the Igiurian type. All pure Igiurian working bees have distinct and beautiful red lines or bands across the upper parts of their abdomens.

**COMB AND HONEYCOMB (F. J.).**—You ask the difference between comb and honeycomb. I suppose you know what honey is. Honeycomb, as Mr. Pettigrew used the term, was doubtless intended to mean pure honeycomb—that is to say, combs which the bees constructed to receive honey alone, and which

has never been defiled by the breeding of young bees or the introduction of pollen. His advice was sound. If you want honey in quantity regardless of quality use eskes, give the bees the amplest space in one chamber of enlarged dimensions; but if you want pure honeycomb use supers. In this case you may obtain what you want; you will certainly do so in good seasons. The clump of bees that seemed half dead on the flight-board only seemed so. Had the sun come out they would have quickly dispersed in fainess of life. On very wet days in close weather the hive becomes very hot and stuffy, which causes many of the bees to cluster outside, preferring the wetting to the stifling. Sometimes they get numbed, and if cold suddenly comes on may die in their rashness. If you can afford to plunder your hives this poor season you can take out one or two combs from each strong hive, but take a whole comb in preference to cutting-off a piece of two or more. Take care you do not overdo it; and if you do, feed-up liberally to the desired weight, making allowance for the hive's weight.

**KNIFE FOR CUTTING-OUT COMBS (A. W.).**—It is formed of a strip of steel 3 feet long by one-eighth of an inch thick; the handle is 30 inches long by half an inch broad. The turn-down blade, of 3 inches in length, is spear-pointed, sharp on the edges, and bent so as to form an angle of 90° with the handle; the other blade is 3 inches long by 1½ inch broad, and sharpens all round. The broad blade cuts and separates the combs from the sides of the hives; and the spear-point, which is also sharp on each side, admits, from its direction and narrowness, of being introduced between the combs to loosen them from the top of the hive.

### METEOROLOGICAL OBSERVATIONS.

CANNON SQUARE, LONDON.

### REMARKS.

- 11th.—Dull morning, but a very fine day, and splendid sunset; rain at mid-night.  
12th.—Rain early, but fine by 8 A.M.; shower in the middle of the day, but fine after.  
13th.—Rain early, and till about 9 A.M.; fine till 1.30 P.M.; sharp shower about 2.30 P.M.; but very fine afterwards.  
14th.—Fine but cloudy at 8 A.M., but fine by 10, very slight shower at 11, but very fine day.  
15th.—A dull morning, but very fine day, only rather too warm to be pleasant.  
16th.—A most splendid summer day, but very hot indeed, and scarce any wind.  
17th.—A very hot night, fine morning, and rather cooler; very fine and very hot in the middle of the day, but pleasant breeze sprang up about 8 P.M.

Mean temperature about 8° above that of last week, partly caused by the intense heat of the last three days.—G. J. SYMONS.

### COVENT GARDEN MARKET.—AUGUST 12.

MARKET still very quiet. Large quantities of French Pears arriving—Williams's Bon Chrétien, Beurré d'Amanille, and Duchesse d'Angoulême.

From observations taken near London during forty-three years, the average day temperature of the week is 72.6°; and its night temperature 48.0°.

## OLLA PODRIDA—A CONTINENTAL TOUR.—No. 2.

LEFT off (page 111) at Aix-les-Bains. It is not my intention to inflict your readers with a chapter out of Murray, as, if they wish it, they can consult that valuable guide book for themselves. I do not, consequently, wish to enter into details with regard to our route, but merely to make a few observations which I hope may prove acceptable to your horticultural readers.

On the Monday we started from Aix for Turin by the Mont Cenis tunnel. The scenery the whole way is very grand and beautiful, and what is particularly interesting is to note how, as the railway begins to ascend, the character of the foliage and vegetation begins also to change. The rise from Chambéry to Modane is very rapid, especially after passing the valley of the Isère and ascending that of the Arc. The mountain sides, especially those to the north and east, are very precipitous, and show the traces everywhere of injury done by sudden thunderstorms washing down the débris of rock, stones, and gravel over the vineyards, which in the lower part of the valleys, nearer to Chambéry, are placed on every point of vantage. As one ascends the valley of the Arc the vineyards gradually give way to patches of Rye and other corn, the Vines being confined only to the cottages or garden grounds; but after Mont St. Michael these too cease, though the thrift of the native mountaineers is very manifest in the way in which they turn every bit of ground into use, and Potatoes and Rye are grown wherever there is sufficient soil to form any staple to work on. Thus—though this is to a certain degree anticipating matters—I saw on the Swiss side of the St. Gothard Pass after leaving Goschemen a crop of Potatoes in one field grown on the top of three large boulders of rock which had fallen off the cliffs, and which were lying on the surface of the ground, the tops of the stones being about 7 or 8 feet above the level of the field. One thing, however, may be safely remarked as a general rule in all these mountain districts, especially in the valleys down which the rivers from the glaciers flow, that the native peasants know full well the value of every square yard of soil, and lose no opportunity of turning it to account. Among other things they are gradually forming alluvial fields in the wider parts of the valley of the Arc by damming up the water, and making it deposit its débris of mud from the glaciers by spreading it equally over the ground by side channels, dams, &c.

It is interesting to watch this land in process of formation, the lower part of it growing crops of Clover, &c., while the middle can only support marsh plants, as Marigolds—i.e., Marsh Ranunculus, Iris, &c., and the upper part is still a pool of muddy water. All the glacier streams bring down a great quantity of detritus, chiefly of the softer whitish granites or the mountain and magesian limestones. This glacier action seems very constant, as in the Isère, the Arc, the Doria, Po, Adige, &c., and the débris which is brought down must be very great;

and though it may be perhaps a bold conjecture to hazard, I cannot help fancying that the flat alluvial plains of Lombardy have been formed in process of time by the action of the glacier rivers overflowing the plains, carrying their detritus with them. It is certainly very singular to notice the way the plains of Lombardy run quite up to the foot of the Alps. The Alps rising from the plain like cliffs from the sea, not so abruptly perhaps as water-worn cliffs; but everywhere in Lombardy the plains, which are almost on a dead level without any undulating or rising ground in them, commence immediately at the base of the mountains, and lie like a level sea between one range of mountains to the other from the Alps to the Apennines.

The line of rails rises up the valley of the Arc about 100 feet in each mile till it reaches Modane, when the rise up to the north-west entrance of the Mont Cenis tunnel (8942 feet high) is very rapid. This was, at the time we passed it, the least pleasant part of our journey, as an avalanche had broken in the arched roof of the last gallery previous to entering into the great tunnel; and while the gallery, or shallow tunnel cut in the side of the hill, was being repaired, the line of rails was carried on a temporary platform of timber and poles, the poles being supported on loose stones on the side of a precipitous cliff overhanging the town of Modane which we had just passed, but which a horseshoe curve of a mile long had brought under our feet again. The train did not go much more than two miles an hour over this temporary viaduct, and it was a relief to get into the tunnel.

The tunnel itself is well ventilated, and lighted at intervals with powerful lamps; the carriages, too, are well lighted; and instead of the atmosphere being at all oppressive, as many persons were led to expect when the enterprise of making a tunnel eight miles long through the heart of the Alps was first entertained, it was far clearer and purer than any of the metropolitan underground railways. One reason which accounts for this is that there is a gradual ascent from the French to the Italian side till within about a mile of the Italian entrance to the tunnel, so that the column of air which enters on the French side is always inclined to ascend. The height of the south end of the tunnel being 4880 feet above the sea, or higher than the northern by 488; moreover, the air at that height is always rarefied, and generally contains an excess of ozone.

As one approached Mont St. Michael on the French side the vegetation rapidly changed, vineyards giving way to Rye grass, Rye grass to alpine plants and short grass; the sides of the hills where the rocks were not too precipitous being clothed with forests of Fir. Mont St. Michael itself is a very striking and precipitous cliff rising from the valley close to the railway, and being remarkable for the great variety of the curvature and character of the strata, and also for the colouring of the mountain limestone. However, I do not wish to detain your readers with any attempt at any geological description of this Mont Cenis range of alpine hill, as the varying character of the strata is most striking. On emerging

from the tunnel the line of rail rapidly descends from Bardonecchia to Susa. Here the character of the scenery is very wild and rugged; at first the railway being carried in a series of tunnels and galleries cut along the face of the cliff overhanging the valley of the Dora Beparia. By degrees the valley opens out, and the different changes of vegetation again commence. First, alpine plants and short herbage where goats and mountain cows graze; then patches of Rye grass; then Potatoes, with Walnut trees, Apples and Cherries grown round the chalets; then a little lower down Vines on the cottages, till by degrees we come to Acacias, Spanish Chestnuts, and fertile vineyards, with crops of Indian Corn; and then, as we reach the plains before entering the town of Turin, the interminable rows of white Mulberry trees, with Vines trained from tree to tree, begin.

The whole of the plains from Turin to Venice are planted with rows of these white Mulberries on which the silkworms are fed. The leaf is different to that of the Mulberry which we usually grow in England, and the growth of the young shoots much more rapid. The trees before we reached Turin were not as yet fit for gathering the leaves from, but as we approached nearer to Venice we saw the leaves being stripped. The silkworms are very voracious, and it is surprising what a quantity of leaves are daily consumed where the larger silkworm-feeding establishments are kept. They are fed in out-houses well shaded and ventilated, but not allowed to be too cold, on large tiers of wood, trays, or shelves raised one on the top of the other, about 12 to 14 inches apart. They are supplied with fresh leaves two or three times a-day, which are gathered in sacks—men, women, and children all assisting in stripping the leaves by means of tripod ladders, much the same as those used by French gardeners for pruning their trees. The trees are kept pollarded and out-back, and the young growth is very rapid, making shoots from 3 to 5 feet long in the season; these are stopped twice, sometimes three times a-year.

The produce of silk in the plains of Lombardy is very great, and the monotony caused by the never-ending rows of pollarded white Mulberries is equally great, the average distance between the rows of trees for many miles in succession being not much more than from 10 to 12 yards, and only about 10 feet or from that to 15 feet between the trees. The intervening space of ground is cropped chiefly with Indian Corn, although Rye is also grown; and between Milan and Verona, where the fields are irrigated, there are also crops of paddy or Rice. The general effect of the plains of Lombardy, though impressing one with their great fertility, is certainly very monotonous, and where whole rows of Mulberries are stripped of their leaves, with bare stems and branches they look very unsightly.

Turin was our first resting-place on the Italian side. It is a city that would delight the Americans, as all the streets run parallel to each other, and are divided by other streets crossing at right angles. It abounds in straight avenues of cropped trees. I had not time to see the public gardens here, but must give Turin credit for the best turf I saw in Italy or, I might say, on the Continent. This was in the square in front of the central railway station, called Piazza Carlo Felice, and, for a wonder, it was well out and also well watered. The river Po rushes by one side of the town, and advantage is taken of its enormous water-power to supply the streets with water by means of water-wheels. I saw the same again in the Adige at Verona. They are erected in the middle of the river, with undershot paddles, which the force of the current turns round. The periphery, or outer rim of the wheel, is hollow, formed, in fact, of a series of boarded-in boxes in which the water is collected and lifted from the river, and they empty themselves when they get to the top of the wheel by means of small spouts into a larger trough, from which it is conveyed by pipes. The whole apparatus (I am describing one or two I took especial notice of at Verona) is exceedingly rough and simple, but at the same time effective. Thanks, however, to the use of the scythe and irrigation, the grass in the Piazza Carlo Felice was really more like an English lawn. I cannot say the same for the public gardens at Milan, although there they had equal opportunities for irrigation; but unfortunately they apparently trusted too much to irrigation there, and took no pains to cut it, and the grass was merely laid flat by the action of the water, and the undergrowth was brown; the effect of the lawn being more like one of our English after-math, or (as in Yorkshire we call them) fog fields, in autumn after heavy rains.

I will, however, continue my remarks upon the Milan and Venice gardens in another number. I had more time at Milan and Venice than at Turin to make notes on the public gardening.—C. P. P.

### EARLY SUMMER FRUITS.

THE first fruit of summer is always looked for more eagerly, eaten with greater zest, and is also more closely criticised than the more abundant and varied supply of autumn; it is, therefore, highly important that it should be as good in quality and quantity as is possible. That both these important properties are liable to suffer from the baneful influences of an unfavourable season has been fully exemplified in the present year, and, unfortunately, when fruit is cultivated extensively, little if anything can be done to avert the evils attendant upon frequent rain, a sluggish moisture-laden atmosphere, and a cloudy sky.

**STRAWBERRIES.**—Immense quantities of Strawberries have been spoiled. A magnificent crop of La Marguerite, with some fruit measuring fully 6 inches in circumference, and which I particularly wished to keep for a few days after it was ripe, was almost totally destroyed by wet, the dense clusters of fruit lying spotted, mouldy, rotten—a lamentable sight not easily forgotten, and an evil as difficult to remedy, for we have no other early Strawberry equal to La Marguerite either in size or appearance. The fruit of Vicomtesse Héricart de Thury withstood the effects of the superabundant moisture better than any other. It is undoubtedly a useful sort, but I would not give the preference to a Strawberry simply because its fruit keeps better than others. La Marguerite, President, Sir C. Napier, Cockscumb, Dr. Hogg, and Frogmore Late Pine are the sorts upon which I depend for a regular seasonable supply. Newer varieties are on trial, but I have as yet seen nothing worthy to take rank with my select half dozen. A white variety having been asked for I have again planted Bioton Pine; its really fine fruit forms a novel and handsome feature in a dessert.

**RASPBERRIES AND CURRANTS.**—Prince of Wales is pre-eminent among Raspberries, its fine, large, handsome fruit being very abundant. Much of its earliest and best fruit was spoiled by the rain. Red Currants also suffered from the same cause. The finest Red Currant is Knight's Large Red, answering admirably to its designation in every respect; stem, branches, foliage, and fruit, both in bunch and berry, are all considerably larger than the ordinary type. This kind, with Victoria for a late sort, merits extensive culture.

**GOOSEBERRIES.**—Split fruit have been very prevalent among large prize Gooseberries, many bushes not affording a single sound berry; the smaller kinds have not suffered so much. A collection of Gooseberries forms an interesting feature in a fruit garden. Many of them are without doubt comparatively worthless when ripe, yet all are useful in the green state. From upwards of a hundred varieties I may select Early Sulphur, Ironmonger, Warrington, Keens' Seedling, Dan's Mistake, a fine, large, red kind, of good flavour, and not apt to crack; Langley Park Green, White Raspberry, Green Walnut, Pitmaston Green Gage, Overall, Red Champagne, and Roseberry.

**CHERRIES.**—Among fruits of loftier growth none are more easily cultivated than Cherries, for no matter what may be the nature of the soil, if it only possesses ordinary fertility the Cherry will flourish in it and yield abundant crops. Unfortunately there are two evils from which its fruit is particularly liable to suffer—the birds and rain. For the rain there is no remedy, but the ravages of birds are easily avoided by the use of Haythorn's netting, which is decidedly preferable to the fish netting, being more durable, and keeping out small insects as well as birds. In order to render this valuable means of protection available a comparatively dwarf mode of culture, either bush or pyramidal, must be adopted, preference being usually given to the latter form as the most productive in a given space, trees of 12 or 14 feet being as readily screened as others of half that height. The best, most useful, and certainly most attractive way of doing this is to plant two parallel rows, and about 10 feet apart, with a path between the rows; the netting is then easily put over the whole of the trees, stretched upon a slight wooden frame, thus forming in favourable seasons a charming avenue, equally useful and ornamental. The netting should not rest upon the soil, but should have a neat calico binding along the bottom, with small brass rings at regular intervals, by which it is attached

to hooks in rough wooden sills laid upon the ground alongside the trees. This simple plan is worthy of attention, as it preserves the netting. No loophole is left for the birds, and access is easily gained to the interior.

The present ungenial season has rendered the duration of the fruit of early kinds extremely brief. I have between twenty and thirty sorts, and will name a few which fruited well this season, and may be strongly recommended for general culture.

*May Duke*.—This forms fine symmetrical pyramids on the Mahaleb stock, and is very prolific. The fruit is large, very sweet and juicy, and earlier than most others.

*Impératrice Eugénie* is very similar to *May Duke*, but certainly not earlier. This season it was quite a week later. Erroneous opinions as to the earliness of any kind of fruit are easily formed, and it would probably prove a mistake if I were to insist that *May Duke* is the earliest kind of the two, and yet I might do so in perfect good faith, judging simply from the results of the present season; but upon inquiry what it was that brought about those results, it was found that the crop of *Impératrice Eugénie* was more than twice as great as the other kind, its fruit clustering so thickly that sunlight and air could not act freely upon it, hence the result. It is an excellent variety of compact growth, very prolific, and is therefore admirably adapted for small gardens.

*Archduke* is another excellent kind of this section, coming in soon after *May Duke*, and affording an abundant supply of fine and very dark-coloured fruit, very sweet and rich in flavour.

*Transparent*.—This is quite the most delicious of the Duke Cherries. Its pale red fruit is tender and very sweet, with a remarkably thin skin. To the connoisseur this may be recommended as one of the choicest of dessert fruits in its season, a veritable *bonne bouche*.

*Reine Hortense*.—A remarkable and striking variety with very large bright red fruit, oblong, and with flattened sides. It has yellow flesh, which is very tender, sweet, and juicy when fully matured. Its magnificent fruit has been of the greatest service this season, and has been much appreciated. Of a compact yet free habit of growth and form; a fine pyramid.

*Kentish*.—One of our most useful Cherries for culinary purposes; quite indispensable for jam, for bottling, and other methods of preserving, and is in constant request for stewing and tarts when in season. It forms fine pyramids on the Mahaleb, and is most prolific.

*Belle Magnifique*.—This, I think, may be fairly termed a late Kentish but with much larger fruit. I have only one plant of it, but that is certainly a "Belle," surpassing all the other pyramidal Cherries in its fine growth and elegant form, which I frequently point-out to visitors as my ideal of what trees so trained should be. One is tempted to extend the list still further, and it is difficult to refrain from dwelling upon the merits of such fine kinds as *Early Rivers*, *Early Purple Gean*, *Duchesse de Palluaux*, *Governor Wood*, *Late Duke*, and several others, but I must not give undue prominence to Cherries in a paper of this kind.

*Plums*.—Of these *Rivers's Early Prolific* stands out pre-eminently among a collection of nearly forty kinds for its early and abundant crops, and its free, vigorous, and symmetrical growth. The dark purple, medium-sized, and very juicy fruit is of the highest excellence for tarts. It ripens in July before all other sorts.

*Rivers's Early Damson* is another excellent culinary fruit, ripening early in August, and forming a valuable connecting link between *Early Prolific* and older sorts of Plums. The fruit is of medium size, and is very sweet and juicy. As Mr. Rivers states in his catalogue, it is a charming addition to Damsons. Most other Plums are more justly ranked with late fruits; but I may add that *Bryanston Gage*, *Jodoigne Gage*, *Lafayette*, *Gisborne's*, *Mitchelson's*, *Victoria*, and *Coe's Late Red* are bearing heavy crops. Almost all the Gages are forming fine pyramids.

*PEACHES AND NECTARINES*.—Among these the honoured name of *Rivers* stands pre-eminent. I have almost a complete set of the *Sawbridgeworth* seedlings in cultivation, but several of the trees are too young for fruiting this season. *Early Beatrice* had an abundant crop, and the fruit was certainly finer than heretofore, highly coloured, and tolerably well flavoured.

*Early Rivers Peach* fully answers my expectations, or rather proves precisely as Mr. Rivers describes it. "Large, colours pale straw, with a delicate pink cheek; flesh melting, or rather dissolving, with a rich racy flavour, most remarkable." Its super-excellence in flavour this season affords additional proof

of the truthfulness of Mr. Rivers's descriptions. The vigour of the tree is remarkable, and I am fully inclined to allow it ample space for its full development, and however long its leading shoots may grow they will not be much shortened when pruned for next season. If we want large fruit we must have a free robust growth.

*Early Louise* is planted in a snug warm corner to see if it will ripen its fruit as soon as *Early Beatrice*, which is desirable, as it is said to be superior in flavour. *Early Alfred* also has a favourable position.

*Rivers's Early York* is a magnificent Peach. Much of its fruit this season is very large and highly coloured, and is excellent in flavour.

*Dr. Hogg* is another fine Peach, large and of rich flavour, carrying on the succession well till the ripening of my old favourite *Grosse Mignonne*.

Of Nectarines the only kind which may fairly take rank among early fruits is *Lord Napier*. It is a splendid variety fully answering to the description given of it on page 110. It is very prolific, and of robust vigorous growth.—EDWARD LUCKHURST.

## NOVELTIES IN THE ROYAL GARDENS, KEW.

In the Orchid-house porch are collected several plants of much interest, and we can there conveniently commence our inspection. *Agapanthus umbellatus major* is a larger and finer form of that well-known and invaluable decorative plant. It is from the late collection of W. W. Saunders, Esq., where we have known it for several years, but from the slowness of its increase has been but little distributed. With one or two exceptions the stock is in the hands of Mr. Green of Reigate. It may seem superfluous to say anything in favour of a plant with such an established reputation, but having recently seen a fine display of the species grown in a window we may mention it as suited to that kind of culture. *Kniphofia MacOwanii*, a dwarf type, we have before described; it is again in flower, and a short time ago was figured from specimens sent by Mr. C. Green, who holds the stock of this as well as of the above.

To *Oxalis Smithii* we would call special attention. It is a free-flowering Cape species, producing a profusion of rose-coloured flowers. The leaves are very pretty; each segment is deeply divided into two narrow lobes. This is a perennial, and in favoured situations is perhaps hardy. *O. rosea*, such as would nicely finish off the front of a conservatory bench.

Though the present is a dull season of the year for Orchids, several beautiful kinds are in flower with others of botanical interest. The new *Cypripedium Sedeni* has two spikes with four flowers each of a fine pink colour. It has the pink flowers of *Schlumlii* with the free habit of *C. longifolium*, and is certainly one of best autumn and winter-flowering *Cypripedes* we have. It is interesting to observe that the parents just mentioned produced precisely the same plant when in reversed relationship as to sex. *C. Veitchii* has three fine flowers. *C. carolinum* and *C. Dominianum* may also be mentioned. *Dendrobium sanguinolentum*, blooming at intervals all the year round, is in good condition. *D. eburneum* is very attractive. Among *Epidendrums* are *E. erectum*, *E. radiatum*, and *E. cinnabarinum*, with *E. cochleatum* and its several varieties, which are never out of bloom. *Oncidium Wentworthianum* has a good spike. There is also a fine plant of *Oncidium lanceanum* with two fine spikes. Here is the interesting *Dove Plant*, or *El Spirito Santo*, so called, as is well known, from the fancied resemblance of the column to a dove. *Phalenopsis grandiflora* is scarcely ever out of flower, and is now represented by a fine form. Also we note *P. cornu-cervi*, *Laelia xanthina*, the sweet-scented *Coslogyne corrugata*, *Masdevallia amabilis*, and the beautiful *Disea grandiflora*.

The *Victoria regia* is now in vigorous flowering condition, and almost every evening from about five to six o'clock may be seen in perfection. Round the tank are several extremely fine specimens of the only genuine aquatic Fern, *Ceratopteris thalictroides*. It is one of the prettiest of Ferns, though quite a rarity in cultivation, perhaps from its being an annual. The light apple-green tint of the fronds is refreshing to look at. Spores are produced in great abundance, and should be sown about March or April, when they germinate in a few days and make rapid growth. The whole plant is viviparous, and plantlets are often freely produced.

Passing through the Economic house we remark in fruit a hybrid that to cultivators of the useful parents must be of

interest, as well as to the scientific. The seeds were presented by Colonel Trevor Clarke, who obtained them as the result of crossing a Melon with Telegraph Cucumber. It partakes chiefly of the character of the Cucumber, the leaves being much the same in form and roughness, while the fruit in shape has a close resemblance but is covered over with a fine network, the most evident trace of the mother. Sageret and Naudin seem to have before tried to cross these plants, and meeting with no success considered them as specifically distinct on that account. It may seem superfluous to say anything on the point of distinctness, but we read in Darwin's "Animals and Plants under Domestication" that "There is a race of Melons in which the fruit is so like that of the Cucumber, both externally and internally, that it is hardly possible to distinguish the one from the other except by the leaves." Further on we have information that, we venture to say, is not known to cultivators as a rule. Some Melons weigh as much as 66 lbs., while others are no larger than small Plums. One is not more than an inch in diameter, and is sometimes more than a yard long, twisting about in all directions. A variety from Algiers is remarkable from announcing its maturity by spontaneous and almost sudden dislocation; deep cracks suddenly appear, and the fruit falls to pieces. The varieties of the Melon are endless. Naudin after six years' study had not come to the end of them.

On the rockwork we shall mention one very charming plant—*Erpetion reniformis*, the Australian Violet. It is now placed in the genus *Viola*, and has only been distinguished by the lower petal wanting a spur and the anthers a dorsal appendage. The leaves are reniform, clothing the ground with a carpet of green, while the flowers rise erect on slender stalks, the centre lilac, each petal tipped with white. At the Jardin des Plantes of Paris a short time ago we saw a perfect specimen. It was growing under a bell-glass in a shaded position, and so situated is quite at home for the summer; but not being thoroughly hardy, must be preserved in a frame during winter.

In the Succulent house are two plants of *Decabelone elegans*, each with a flower. It is closely allied to *Stapelia*, but has funnel-shaped flowers. As a new plant we gave a detailed description at page 486, June 18th, 1874.

In the Herbaceous ground *Clematis Davidiana* is very attractive from the dense fascicles of its pale blue flowers. It is allied to *C. tubulosa*. *Campanula isophylla alba* is a welcome companion for the blue-flowered species; it originated here among a batch of seedlings. *Linum salsoloides* is one of the most choice and distinct for rockwork; the stems are very slender, and support a multitude of white flowers tinged with lilac in the centre. *Eucemis punctata* from the Cape seems to be hardy; it now has stately flower spikes, and though green-flowered it is worth growing from its distinct character. *Eryngium Sumbul* unfortunately has not matured fruit, probably from the extraordinary continuance of wet weather during the time of its flowering. We understand that fruit has been ripened at St. Petersburg.

#### TAKING-UP AND STORING POTATOES.

MR. RECORD has, on page 140, recommended a plan adopted by Mr. Durey of Hothfield in order to mitigate the effects of the disease. This is the very simple process of pulling-up the haulm and leaving the tubers in the ground. It is a pretty-well-ascertained fact that if the haulm is pulled away from the rows soon enough—that is, before they are in any way affected by the murrain—the crop itself is safe; but if the haulm is once affected, even if only slightly, the removal of the haulm then is no safeguard against the disease destroying the tubers; these will decay as rapidly as if the haulm had not been removed.

By experiments extending over a series of years I have found that by removing the haulm from early Potatoes in July, before any signs of the disease have been manifest, the tubers if left in the ground for months are not afterwards affected by the murrain however virulent it may be on the later crop, and also on the early crops, from which the haulm had not been removed, or had not been removed soon enough.

Cutting off the haulm is not nearly so effectual as pulling it up, and pulling off is of no real use unless it is done before the plants are affected.

After the haulm is removed the tubers do not swell, and the utmost watchfulness is needed to determine when the work can be the most profitably done, for by pulling too soon we sacrifice the bulk of the crop, and by postponing even a day too long the work of removing the haulm is futile. When the

disease has once become established in the plants it spreads through the tubers whether the haulm is removed or not, providing the weather is propitious for fungus growth.

For the rapid increase of the Potato fungus moisture is not only needed but also a high temperature. If a moist high temperature is provided the tubers will decay whether they are out of the ground or undug; therefore an all-important point to determine, by way of arresting the murrain, is—in what place the tubers can be kept the most cool, whether in thin rows under ground or in stores above it. Moisture alone without heat does not foster the spread of the disease germs which are already in the tubers nearly so much as does heat without moisture. As an example, take up tubers from an affected crop and bury a portion thinly in a cool moist place in the garden, and at the same time introduce another portion into a heated structure of any kind having a minimum temperature of 70°. Those in the heat, even if kept dry, will decay with great rapidity, while those which are cool, if moist, will remain apparently sound for a great length of time.

Merely storing thinly will not check the spread of the disease unless the temperature is cool. A single layer in a temperature of 70° will decay, while a layer a foot thick with a temperature of 50° will remain sound, or at any rate the disease will be quiescent. This is an important point to bear in mind in the storing of Potatoes.

In the large Potato-growing districts it is a common practice to cart the Potatoes into heaps by the side of corn stacks, so that poles can be leaned over them and covered with tarpaulin to protect them from rains until the bulk can be sorted by women and children. I have seen such heaps on the south side of stacks a mass of rotteness, those on the north side not being nearly so bad. The difference in temperature was plainly the reason of the difference in the decay. No practice can well be more reprehensible than to pile a disease-infected crop into large heaps, where they must necessarily remain for a considerable time before they can be sorted. A practice such as that, and it is a very common one, is really an invitation to the disease to come and do its worst. It is, by the heating which must inevitably take place in a large heap of newly-dug Potatoes, creating the very medium in which the Potato fungus luxuriates, and which must end in the destruction of the bulk of the produce. Better, far better, than this is it to leave them in the ground until November, where the tubers will be cooler and an infinitely greater portion of them will remain sound.

I am one who believes that there is a great deal of force in the practice of Mr. Durey as quoted by Mr. Record, simple as it may appear, and unlikely as, at the first glance, it may seem calculated to mitigate the destruction of the tubers.

The storing of Potatoes is an important matter, and by injudicious treatment in this respect thousands of tons of valuable produce have been ruined. So far as I have been able to judge it is a vital point to keep the tubers cool. If they can be stored cooler out of the ground than in, take them up; but if they are cooler in the ground than out of it, leave them undug until November. This advice is not founded on theory alone, but actual practice. I cannot, however, go further into the matter at the present, but the question is worthy attention, and cultivators would do good service by recording their experience of the best treatment of the crop at the time of its harvesting.—YORKSHIREMAN.

#### FRUIT ROOM.

In all large places, where a quantity of fruit has to be kept in good condition until its proper time of ripening, a good fruit-room is an indispensable adjunct. This season there is every prospect of good crops of fruit, and no doubt many a gardener will be puzzled to know where to store it, and will be compelled to make use of many makeshift plans where it will be impossible to keep it, or to examine it as it ought to be. It will be thrown in heaps like so many Potatoes, where decay will speedily take place after it is gathered; and on the first general examination, which will probably take place the first wet day that happens after it is all collected, it will be found that a great quantity of the fruit is in all stages of decay, and that basketful after basketful of the once beautiful Pears or Apples has to be consigned to the rot-heap or a dessert for the pigs—a waste which the gardener can in no way avoid if a suitable structure is not provided for storing.

Gardeners who have a large quantity of fruit to keep, and who are not provided with proper structures, should point out

to their employers the necessity of erecting such. Let them explain minutely the necessary requirements, and perhaps there may be found some existing building that could with a very little expense be fitted up as a fruit room; or, in the absence of that, he will be able to point out the most suitable site for one, and the most convenient and best mode of fitting it up, &c., and there is no reasonable employer but will accede to his request.

I send you ground plan and section of a fruit-room which has been erected here for my employer, W. Hatton, Esq., as it may, perhaps, be of some assistance to those who contemplate erecting one. Fig. 23 is a section of it, and shows the ventilator at the far end of the room. It is at the back of the north wall of the garden where it is erected, so that the aspect is north. One-half of the door of entrance to the room is *louvre* with slide, so that we can have a current of air through the room, or shut it up as required; the windows open also as ventilators if required. There is an air space in the walls with ventilating air-bricks bottom and top, which prevents all danger arising from a damp inside wall, and is also much more effectual in resisting the frost than a solid wall.

chemist, and his garden is in close proximity to his works; but on entering the exhibition tent and after a careful inspection of the plants all idea of the smoke, the dust, and dirt of the "east end" of London is removed; the plants and flowers are as clean and healthy as if they had just been removed from the bracing air of the country.

The principal competition was in the collections of plants, and these were arranged much in the same way that the principal nurserymen arrange theirs at the large exhibitions—foliage and flowering plants, either stove, greenhouse, or hardy, mingled together to form the best effect possible. Mr. O. Parker, from Clay Hall Works, Bow, had the best collection, it occupied 80 feet run of staging; another very nearly equal to it from Mr. H. T. Deacon, British Street, Bow, of the same extent was second. In Mr. Parker's collection were some very well-grown Palms, and in the front row dwarf Cookscombs of excellent quality. Mr. Deacon also exhibited a splendid *Dicksonia antarctica*, five hardy Ferns, and six fine pots of *Glaucolus Breuchleyensis*. Lilliums were very fine indeed, the best were sent by Mr. Hare. Dahlias were exhibited by Mr. Whendon, High Street, Poplar. Fuchsias very well grown indeed by Mr. Hanson. There were also collections of fruit, showing that pomology is not neglected where floriculture flourishes. Mr. Yull of 10,

b, Pathway.

Fig. 24.  
Ground Plan.

Scale 8 feet to the inch.

c, Trailing shelves.  
d, Air space in walls.

e, Lids for admitting hot air from pipes underneath.  
f, Ventilator.

The interior arrangements, as will be seen from the drawings, consist of trellis shelves all round, and opposite each window is a table with drawers underneath; the former is useful for examining or comparing fruits, the latter for storing any choice sort. There is also a table down the centre of the room 20 feet long, and a pathway all round laid in diamonds with 6-inch paving bricks, red and blue alternately. In the pathway will be seen two lids; these are to admit heat if necessary from hot-water pipes underneath. The pipes are mains, flow and return, which supply a range of houses on the opposite side of the wall. The ceiling is covered with match-planned boards, and all the woodwork is planed smooth, and the sharp edges taken off the strips to prevent any indentation of the fruit; and the uprights and strip in front of each shelf. The ceiling and table-tops are all varnished, so that the whole presents a very neat appearance, and my employer along with his friends enjoys a walk round the fruit-room quite as much as round the garden, examining the different sorts of fruits, which are laid out singly and named, and with their supposed time of ripening also noted.—J. ANDERSON, Hill Grove.

#### EAST LONDON AMATEUR FLORICULTURAL SOCIETY.

THE summer Exhibition of this prosperous Society was held in the grounds of the Grammar School, Tredegar Square, Bow, on the 16th and two following days. On the present occasion a large tent was quite filled with the productions of amateurs in the vicinity, and the excellent exhibition which they made was an instance of what can be done when men are thoroughly in earnest. Their gardens without exception are of very limited extent; their glass houses are also necessarily small, and are not always built according to the latest designs and on the most improved principles. The men who own the houses and gardens are hardworking men, and are engaged by day either in business or mechanical pursuits, and their hours of relaxation are devoted to their flowers. In nearly every instance is their gardening carried on under difficulties, but these are only there to be overcome. One of the principal exhibitors is a manufacturing

Frederick Place, Bow Road, had Muscat and Black Hamburgh Grapes, Pears, Apples, &c. Mr. Parker had Peaches, Plums, Pears, and Apples; and Mr. Whendon also showed a creditable collection. The Balsam is a popular flower at the east end, and it was represented by a large number of well-grown plants.

We must not omit the dinner-table decorations and the baskets of flowers. Some of the baskets were very well arranged, but the largest number were too heavy and stiff; and in respect to the dinner-table decorations, while none of them could be said to be first-rate, the largest portion were well arranged, the fault throughout being an over-abundance of flowers. Even the first-prize vases were not faultless in this respect.

Great praise was due to those exhibitors who sent plants and cut flowers not for competition. Mr. S. Hill of Alfred Street, Bow, sent a large collection of well-grown plants. Mr. W. Paul of Waltham Cross sent stands of Roses and Zonal Pelargoniums; and Messrs. Paul & Sons, Cheshunt, cut Roses, both exhibitors having very fine blooms of the leading varieties. We were informed that many thousands of visitors were admitted to the show during the three days that it was open, and in many a heart the love of flowers must be fostered and encouraged. The Committee, which is composed of the exhibitors themselves, deserve thanks for providing such an interesting source of recreation in this densely populated neighbourhood.

#### MR. THOMAS TAYLOR.

MUCH do we lament the death of this contributor to our columns. In all the relations of life he was estimable. As a member of the firm of Webber & Co., fruiterers in Covent Garden Market, he was an able and courteous man of business. Having a love for and sound knowledge of fruit and its culture, he aided in the effort to establish the Pomological Society, and to within a few years of his death he continued a member of the Fruit and Vegetable Committee of the Royal Horticultural Society. He died on the 15th inst., aged sixty-seven.

MULCHING STRAWBERRIES.—Some years ago I read in this Journal that bean chaff was excellent for mulching Straw-

berries. I have used it ever since, watering them with weak liquid manure, and then putting on the chaff just when the flowers were setting. I never see a slug, and my Strawberries are splendid. I have only a man of all work, and we have better fruit than our neighbours with several gardeners.—  
A POOR LADY.

### ALEXANDRA PALACE.

#### THE METROPOLITAN FLORAL SOCIETY'S SHOW, AUGUST 24TH.

When we find nearly £50 in prizes offered for Dahlias, upwards of £20 for Hollyhocks, £35 for Gladioli, and £18 for Asters—when we find this, also at the helm the Rev. H. H. Dombrain, we are satisfied that neither by a lack of energy in management or encouragement to growers shall this autumn exhibition of florists' flowers fail. Added to this we have recently had fine weather to finish the flowers which constituted this two-days exhibition. The display may be fairly considered a good one, and such as should afford encouragement to the promoters in their laudable endeavours to promote the cultivation of such garden flowers as may be—but are not—grown in every garden. As to the intrinsic beauty of these flowers none can dispute it. What more brilliant and yet more stately than a collection of Gladioli, either in the garden or on the exhibition table? What more rich and imposing than the symmetrical and massive Dahlias, or more commanding than the towering forms and varied masses of colour of the Hollyhocks? Where can we find a more diversified display of colour combined with beauty of form than is afforded by the varieties of Asters? And to these may be added brilliant Zinnias, Verbenas, and Roses, and we have the material to make the garden gay and the show room attractive.

The collections were arranged down each side of the great hall, reaching nearly the entire length, the centres of the tables being occupied by well-grown Ferns, Begonias, &c., furnished by the Palace Company. These plants afforded a great relief to the formal masses of cut flowers, and broke up the monotony which otherwise would have prevailed.

The most effective display in the Exhibition was undoubtedly afforded by the Gladioli. These were staged in considerable numbers, and many of them were of high quality.

In the nurserymen's class for thirty-six varieties Messrs. Kelway & Son, Langport, were in the ascendant. Their collection was a noble one, being massive, varied, and brilliant. In the high-coloured section some of the most striking were Prometheus, fiery scarlet; Meyerbeer, vermilion scarlet; Antisthenes, Oscirus, and Victor. Of salmon and roses, Astra, Serapis, Alector, Carbas, Pythias, and Agrius were the best, the last-named having a certificate of merit awarded it, it is a stately flower of fine form. Among the lighter colours Shakespeare was pre-eminent, followed by Chromius, Mansolus, Clymenus, and Veronica. Certificates were also awarded to Titus, a fine flower flaked with lilac purple and magenta, and Brennus, a rich flame-scarlet variety. Messrs. T. Bunyard & Sons had a third prize for smaller spikes. For twenty-four varieties Messrs. Kelway again distanced their competitors with a collection which had not a poor spike or indifferent bloom amongst them. Mr. Walker, Thame, and Messrs. T. Bunyard & Sons had second and third place respectively with attractive collections.

In the amateurs' classes also splendid spikes were exhibited, those from Rev. H. H. Dombrain and Mr. Douglas, gardener to F. Whitbourn, Esq., being equal to those of Messrs. Kelway. For eighteen varieties Mr. Douglas had the post of honour. With the exception of Delicatissima and Madame Furtado the whole collection were seedlings raised at Loxford. One of these had a certificate of merit, and was named Mr. McKenzie. It is a smooth flower of perfect form, and a warm salmon-rose colour; it has a good spike, and worthily heads the list in this section. The remainder of the seedlings were fine, one of them having twenty-four blooms and buds, and embraced a great variety of colours. The Rev. H. H. Dombrain was placed second with very fine spikes of Meyerbeer, Horace Vernet, Robert Fortune, Peyche, Seda, Glinerva, and seedlings. For twelve varieties the Rev. H. H. Dombrain had the first place with admirable spikes, in which the rose-feathered varieties predominated. Very fine indeed were Murillo, Meyerbeer, Legouvé, Lady Bridport, and Pactole. The last-named is a distinct sulphur-coloured variety, and had a certificate of merit awarded. Mr. Douglas was placed second with, principally, seedlings richer in colour but not so fine in spike as the preceding. Mr. Stadden, Chipping Norton, and Mr. Catley, Bath, were placed second and third respectively with meritorious collections. For six varieties first honours went to Mr. J. W. Minchin, Eastend, Hook Norton, with capital spikes of Eugene Scribe and Madame Furtado, the rest being seedlings; Mr. Fewkes being second. Messrs. Kelway also exhibited a miscellaneous collection of sixty varieties.

Dahlias were the next important feature of the Exhibition. Owing to the cold and wet July these have not quite reached their zenith of perfection, yet many very fine blooms were

staged. In the nurserymen's class for forty-eight varieties Mr. Keynes, Salisbury, had a collection of great excellence, but owing to the names having been hurriedly scribbled in pencil on blue paper they were nearly invisible to the spectators. For twenty-four varieties Mr. Walker, Thame, had the first place, his best blooms being Grand Sultan, John Kirby, Thos. Gardener, W. P. Layard, Jas. Cooker, Julia Myatt, John Standish, Royal Queen, and Hugh Miller. For twenty-four Panoles Mr. Keynes and Mr. Walker were placed first and second respectively. In these boxes really splendid blooms were exhibited of Rev. J. B. M. Camm, Rose Flake, John Lamont, Letty Coles, Fanny Sturt, and Egyptian Queen.

In the amateurs' classes for twenty-four varieties, Mr. Fewkes, Tyburn Erdington, Birmingham, was first with charmingly finished blooms of Leah, Lord Derby, Flag of Truce, John Standish, John Neville, Miss Turner, James Service, Mrs. Boston, Walter Reid, &c. Mr. Southgate, gardener to J. Pettward, Esq., Frimborough Hall, Stowmarket, had the second place. In this stand Charles Backhouse, June, Critarian, and Norfolk Hero were perfect, and the rest good. Mr. Petfield, gardener to J. Thornhill, Esq., Deddington, third. For twelve varieties H. Glasscock, Esq., was placed first with a collection of great merit, every bloom being good. They comprised Royal Queen, James Service, Cremorne, Thos. Goodman, Flag of Truce, Queen's Messenger, Vice-President, Ovid, Mr. Harris, John Standish, Picotee, and Willie Eckford. Mr. Hurst, Putney Road, Enfield Highway, was placed second. Mr. G. Smith, New Villa, Hedge Lane, Edmonton, third; and Mr. Griffith, Brooklet Villa, Wood Green, fourth. For twelve fancies Mr. Petfield, gardener to A. J. Thornhill, Esq., Deddington, had the first award with grand blooms of Mrs. Saunders, John Lamont, Flora Wyatt, Fanny Sturt, Grand Duchess, Mrs. Bennett, and some well-marked seedlings; H. Glasscock, Esq., Mr. Southgate, and Mr. Fewkes following in the order named. Certificates of merit were awarded to Mr. G. Rawlings, Romford, for Mr. Quennell, orange tipped with red, a richly-coloured flower of good form, and John Bennett, crimson scarlet, an immense bloom of good shape; also to Mr. Keynes for Henry Glasscock, bright maroon, smooth, and of very fine shape.

Hollyhocks were the weakest part of the Show. For nine spikes, open, Mr. Chater, Saffron Walden, won with Rose Supreme, Alba superba, Leah, Purity, Midnight, Fire King, Perfection, Mrs. Chater, and Exhibitor. Mr. Minchin also had a minor award. For twenty-four cut blooms Mr. Chater was again placed first, Mr. Minchin second, and Mr. Walker third, but except the first-prize collections the blooms were very small. Amongst amateurs, for twelve blooms Mr. Catley and Mr. Minchin were placed first and second respectively, and for six blooms Mr. Petfield was first with the best blooms in the Exhibition, Mr. Fewkes having the second award.

Roses were particularly bright and fresh. In the nurserymen's class for twenty-four varieties the redoubtable Obesumbra firm of Paul & Son had the first place with a collection worthy of a June show, Mr. Keynes being placed second with a good collection, and Messrs. T. Bunyard & Sons, Ashford, third. Messrs. Paul & Son also exhibited a collection of the best varieties in quartets; Mr. Prince, Oxford, exhibiting equally well in triplets. Mr. Turner, Slough, staged a box of Rev. J. B. M. Camm, the sweetest of all sweet Roses, excepting perhaps the old Provence Cabbage, and with its sweetness a fine form and a rich salmon rose colour. This should become a highly popular garden variety. A first-class certificate was awarded. Amongst amateurs Mr. Fewkes was the only exhibitor; his blooms were very good.

Asters were an extensive and excellent display. For thirty-six varieties of French Asters Mr. Walker was placed first in the open class for very perfect blooms, followed by Mr. Chater, Mr. Betteridge, and Mr. Meadmore respectively. Amongst amateurs the honours fell in the following order—Mr. Morgan, gardener to Major Scott, Wray Park, Reigate; Mr. Petfield, Mr. Catley, and Mr. Anderson for highly creditable collections. The Quilled or German Asters were a charming display and a source of great attraction to the visitors. The awards went in order to Mr. Betteridge; Mr. Benham, Newbury; Mr. Webb, gardener to J. Pennystones, Esq., Chipping Norton; and Mr. Petfield. Mr. Betteridge also exhibited fine named varieties.

For twelve Zinnias Mr. Chater was placed first for brilliant and very double flowers, followed by Mr. Walker, Major Scott, and Mr. Hooper in the order named. For Verbenas Mr. Turner was the principal prizetaker, and Mr. Hooper exhibited Phloxes. The Exhibition being extensive and the quality good, with fine weather and a large attendance, it is hoped the success is commensurate with the efforts which have been made to secure it.

FLOWER MISSION, HOME OF INDUSTRY, COMMERCIAL STREET, SPITALFIELDS, E.—The work of this Flower Mission, and that at the Conference Hall, Mildmay Park, N., which has been such a cheer to hundreds of suffering ones, is falling off terribly for want of flowers. We should be most thankful for any.

flowers, or pots of flowers, or packets of flowering bulbs; also for Lavender and fresh fruit. I am sure our need has only to be mentioned to secure the kind help of your readers—the possessors of gardens and orchards.—E. A. H., *Sec. Flower Mission*.

### KNIGHT'S NURSERY, HAILSHAM.

HAVING accomplished a peep at Piltown, a rosarian's next desire during his stay at Eastbourne will be to visit the birth-place of that very charming Rose Princess Louise Victoria. This Rose is of a colour quite new among English seedlings. It is of very vigorous growth, and certainly almost an exhibition Rose. I was very sorry to hear that there were no sisters likely to follow. Mr. Knight has not since then been doing much in the way of English seedlings.

He took me over his gardens in a very obliging way, and we had an agreeable chat as to the coming Roses of the period. I saw some very fine blooms, considering the season and the want of rain at Hailsham, and shall venture to transcribe my notes, as, judging by myself, Rose gossip in your columns can generally meet with a reader.

The soil of the Hailsham nurseries is a good loam with clay underneath, and the Roses flourish accordingly. Capitaine Christy was only good on the Briar, the Manetti he had taken to very unkindly; Niphetos was magnificent, Marguerite de St. Amand good. This was also particularly fine at Piltown. To the Duchess of Edinburgh I desire to make my apologies for what I lately said of her. As bloomed at Hailsham she is almost as good as Marguerite de St. Amand, and very fragrant indeed into the bargain. As Miss Ingelow says in one of her charming Lincolnshire poems—

"A sweeter woman ne'er drew breath  
Than my son's wife Elizabeth."

I never held a sweeter Rose in my hand than the Duchess of Edinburgh with which Mr. Knight presented us.

Among other new Roses Albert Payé appeared a lighter kind of Mdle. Marie Finger, and decidedly good; Maxime de la Rocheville was new to me, it is of enormous size and very dark; Princess Beatrice is here also very taking. There was a most charming box of this last June at the Alexandra Palace. Susannah Wood was one of the most striking Roses. It is as large as Paul Neron, and very like him, but has the petals beautifully imbricated, almost after the fashion of the Tea Rose Homère. I am inclined to think it will come to the front. Mr. Knight pointed out to me another new Rose with which he is much pleased, and which can hardly fail to be appreciated in "the box." It is called Souvenir de Spa, and is of vigorous growth. It has all the compactness of Sénateur Vaisse, with a depth of colour that is worthy of Reynolds Hole; it is a Rose that I have not as yet seen anywhere mentioned.

The Roses I understood received comparatively little dressing, except one of burnt earth mixed with weeds and other refuse. They certainly do credit to their place and culture.—A. C.

### POROUS GARDEN POTS.

MR. SIMPSON and myself judge from different standpoints, therefore it is not likely that we shall agree except to differ. It is for others to determine for themselves the advantages of a dirty over a clean pot, and a glazed over a moderately porous pot. I advocate cleanliness and moderation; my friendly opponent dirt and dogmatism. I discriminate between the nature of plants and their adaptability to a given character of pot, admitting that some flourish in glazed pots; he admits no such distinction, but believes that epiphytall plants may be well grown in poreless pots, and clinches his argument by stating that Mr. Thomson is transferring even his Orchids to glazed pots. Well, someone must be the horticultural Columbus to teach us the process of making an egg stand on its end. I confess that I have failed, and have had to remove Orchids out of porous pots and material into others more porous still, and I have seen the advantage of doing so.

But Mr. Simpson requires "reasonable evidence." I can give no better than that the Messrs. Veitch of Chelsea, instead of using pots with perforated sides (porous enough, one would think), are finding the advantage of growing many specimens in open latticework crates. This practice has not, that I am aware of, been hitherto alluded to in the horticultural press, but the "utility" of it is proved to demonstration. The fact is that many plants which flourish in close airtight pots and material do so mainly by the roots that are outside the pots

feeding on the air, and not by the roots inside the pots, which often convey but little nutriment to the plants which they are fondly supposed to support.

I have readily admitted that very soft and coarse clay pots are not the best for the general use of general growers of plants, and the same experience compels me to say that clean, well-burnt, earthenware pots are the most safely recommendable of all the sorts that I have used. I have been potting plants for twenty-five years, and have Mr. D. Thomson's testimony as to being "practical," and other proofs which I value, if possible, even more than that. That is my excuse for writing. I do not complain of anything that Mr. Simpson has said, but, on the contrary, welcome his experience, which will set others a-thinking and lead to further experiments on this important matter. I have nothing more to say.—*EX-HIBITOR*.

### PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

*MERTENSIA ALPINA*. Nat. ord., Boraginaceae. Linn., Pentandria Monogynia.—Flowers blue. "A lovely little rock plant, a native of the higher parts of the Rocky Mountains, and, like many such, inhabiting an immense stretch of latitude—namely, from 39° N. to the Arctic seacoast. It is an extremely variable plant. *M. alpina* was imported by Messrs. Backhouse of York, who flowered it in May last."—(*Bot. Mag.*, t. 6178.)

*MICHELIA LANUGINOSA*. Nat. ord., Magnoliaceae. Linn., Polyandria Polygynia.—Dr. Hooker says, "Described as a lofty tree in Nipal, according to Wallich, by whom it was discovered in 1821; though I never saw it forming anything but a small tree in Sikkim, where I found it at an elevation of 6-7000 feet in 1848. It has also been collected in Bhotan by Griffith, and in the Khasia Mountains by Lobb. The flowers, which are very sweet-scented, vary much in size, from 3 to 4½ inches in diameter, in the number of sepals and petals, and in the depth of their straw colour.

"*Michelia lanuginosa* was sent to Kew from Sikkim by Dr. Thomson, when superintendent of the Botanic Gardens of Calcutta, about twenty years ago, and was planted out in the Temperate House about ten years ago. It now forms a small sparingly-branched tree, 12 feet high. It never flowered till the present year, when many buds formed in March, and which, owing to the cold and cloudy spring, never opened till May, by which time most had fallen off unopened. Wallich observes that the scent of the flowers is less powerful, and therefore more agreeable, than in the other common Indian species of the genus, of which the *Champaca* is the best known."—(*Ibid.*, t. 6179).

*TYPHONIUM BROWNII*. Nat. ord., Araceae. Linn., Monœcia Polyandria.—Spathes purple. "A very curious Aroid, belonging to a genus that extends from Western India to Australia and the Malayan Islands, and of which probably many species are still to be discovered in New Guinea and the eastern islands of the China sea. It is a native of Eastern Australia, extending from Port Jackson northward to Rockingham Bay in latitude 19° S., and, according to Mueller, varying in the length of the club-shaped apex of the spadix from 1 to 5 inches. As also in the breadth of the spathe. Under these circumstances it is not surprising that Robert Brown referred this to the *T. oxianse* (Arum oxianse of Roxburgh), a plant very widely spread in tropical and subtropical India, and which yet may prove to be a geographically-separated variety of this. *Typhonium Brownii* was flowered by Mr. Bull in April last from bulbs imported by him from Rockhampton in Queensland."—(*Ibid.*, t. 6180.)

*ERANTHEMUM HYPOCATERIFORME*. Nat. ord., Acanthaceae. Linn., Diandria Monogynia.—Corollas scarlet above and yellow beneath. "The genus *Eranthemum*, of which there are so many Indian, Pacific Islands, and Brazilian species, is comparatively scarce in Africa, where only six species have been hitherto detected, though no doubt many more await discovery. Of these the present is much the handsomest, and is indeed one of the most attractive of the genus. It is apparently confined to the west coast, extending from Acra to Sierra Leone, from which latter place seeds were received in 1870 from the Rev. Mr. Bockstadt, a very intelligent gentleman attached to the mission there, to whom the Royal Gardens are indebted for many interesting plants, and who has since fallen a victim to disease contracted in that pestilent climate. *E. hypocateriforme* flowered in the Royal Gardens in May of the present year."—(*Ibid.*, t. 6181.)

*ALLIUM MACROSTYLOIDES*. Nat. ord., Liliaceae. Linn., Hex-

*andria Monogynia*.—Flowers purple. "This is by far the most showy in its flowers of all the *Alliums*. It is a native of the limestone mountains of the south-east of France and north-west of Italy, and belongs to the large group of species in which the annual bulbs arise from a creeping perennial rootstock, which is covered by a dense coat of matted fibres."—(*Ibid.*, t. 6182.)

*COLUMELLIA OBLONGA*. *Nat. ord.*, *Columelliaceae*. *Lin.*, *Diandria Monogynia*.—Flowers yellow. "There are but two species known of the genus, and both are natives of the Andes, where, however, they have no wide range, being apparently confined to the Andes of Peru and Ecuador. *C. oblonga* inhabits an elevation of 9000 to 13,000 feet, and is very common in the heights above Quito. It was raised from seeds sent by Dr. Jameson to J. Anderson-Henry, Esq., who forwarded a young plant to Kew in 1870, which flowered in the Temperate House for the first time in January of the present year."—(*Ibid.*, t. 6183.)

*PEACH*.—*Dr. Hogg*.—"It is a very handsome high-coloured fruit, likely to take a high place on the exhibition table, as well as in the garden and forcing house. The following is the description of this variety in the new edition of Hogg's "Fruit Manual":—

"Fruit large and round, with a very distinct suture, which is deeply cleft at the apex. Skin thin but tough, lemon-coloured, dotted with crimson on the shaded side, and with a faint crimson cheek next the sun. Flesh yellowish-white, somewhat firm, but melting, with a rich, full, and sugary flavour, which adheres to the palate notwithstanding its fine bristleness; it is very deeply stained with red at the stone, from which it separates freely. Flowers large. Leaves with kidney-shaped glands.

"This ripens about the 10th of August, and is a very large early Peach. As an exhibition variety it will be in high repute on account of its size and remarkably full flavour; and for market purposes its earliness, size, and the ease with which it bears carriage, will render it one of the most valuable Peaches in cultivation. The tree is a very strong grower, remarkably vigorous and healthy, and it bears immensely.

"It was raised by Mr. Rivers from a French Peach he received from Brittany under the name of *Pêche Deniaux*; and first fruited in 1865."—(*Flor. and Pom.*, 3 s., viii., 185.)

## ROSE ELECTION, 1875.

### No. 1.—PERFUME.

NAME the Roses which you consider most agreeably scented, underline the twelve most esteemed, and limit the list to twenty-five names.

After thinking the matter over some time, this seems to me the most feasible plan. I am quite prepared for startling results, because perfume after all is like the preference for "Apples" or "Onions." I at one time thought of limiting the *Tes*. This to some might seem arbitrary. I therefore adopt the plan above, and ask all readers of our Journal interested in the matter to give me their lists as soon as possible.

### No. 2.

Name the best twenty-five Roses introduced since 1869, the *Marquise de Castellane's* year, including that year, and underline the best twelve of these.

I shall be glad to have replies to these two queries as soon as possible, though it is not my intention to close the poll until, perhaps, the middle of September, but of this due notice will be given.—JOSEPH HINTON, *Warminster*.

## STRAWBERRY CULTURE.

IN answer to "C. P. P." I beg to state that I find *La Grosse Sucrée* a first rate Strawberry, fully a week earlier than *Keens' Seedling*, good quality, ripens its fruit well, bears a good crop, and continues in bearing a long time. I have about a quarter of an acre in Strawberries, and I shall have this year upwards of forty sorts growing, and my experience so far for the best ten or twelve sorts would be as follows:—*Early Crop*—*La Grosse Sucrée*, *Keens' Seedling*, and *Princess Alice*. *Main Crop*—The *Amateur*, *Sir Joseph Paxton*, and *Ne Plus Ultra*; and for *Late Crop*—*British Queen*, *Elton Pine*, and *Victoria*. President, of course, I find to be a splendid Strawberry for main crop, also *Filbert Pine* for late crop; but one drawback is that they do not fruit well the first year. My practice is to plant-out runners in June and July in a bed of

well-prepared soil, at the distance of 1 foot apart, and transplant into their fruiting quarters during August and September, minding to choose suitable planting weather. By this means I always succeed in obtaining a large crop of splendid fruit on first-year plants. This year I gathered from sixty plants of *Sir Joseph Paxton* and *Ne Plus Ultra* 67 lbs. of beautiful fruit, such as would have made 1s. to 1s. 6d. per lb. in Covent Garden Market, and which I sold at 8d. to 1s. per lb. These were first-year plants, and planted last September. I am busy now preparing the land for planting, and my plants in the nursery bed cover the land. I shall have great pleasure in sending Mr. P. a few plants of *La Grosse Sucrée* if he wishes to give it a trial. A dozen nice plants can be sent by post for 4d. postage.—WILLIAM LOVELL, *Weaverthorpe, Yorks*.

## GARDEN EXPENSES IN THE SIXTEENTH CENTURY.

How little many of us know respecting the horticulture of former days! I wish that some enterprising spirit among us would furnish us with copies of old Gerard's "Herbal." Much am I interested by details of the olden time; and knowing others who are so, I have thought that the following extracts might be interesting to others of the readers of our Journal. They are extracted from the Hampton Court books.

"1529. Swete williams were purchased at liiij. the bushell. Gillavers slippes, Gillavers mynts, and other sweete flowers, at the same price. Crosealls at liiij. the c. Payd to John Hutton of London, gardener, for boulder of rosemary of liij. yeres olde to sett about the mount in the kynges new garden, li. vid. Payments to women weeding in the kynges new garden, every of them liij. the day. Similar price is paid for watterynge. Paid to Ales Brewer and Margaret Rodgers for gathering of 84 bushells of strawberry roots, primrose, and violets, at liiij. the bushell, viij. vid. Item, to Matthew Garrett of Kyngston for setting of the said rots and floures by the space of xx. days, at liiij. the day, vs. Appul trees and payr trees for the new garden, at vid. the piece, vi. c. Cherry trees at vid. the c. li. c. Young trees of oke and elme, five score to every hundred, at xli. vi. the hundred, to set in the kynges great orcharde, xxvj. Gatherynge of v. quarters of acornes to sow in the parks at Hampton Court, at liiij. the quarter; also of iii. quarters and i. bushell of hawes, slowes, and acornes at lyke pryse. Empeion of quycksetts for the tryangell at the mownte, 40 great setts of you, genaper, and holly, at liij. the pece. Woodebyne and thorne at vd. the c. Quyksett of white thorne to sett about the new parke next unto Hampton Tonne, at liij. liiij. the thousand. Amongst miscellaneuous items we find—A garden spade for the French priest to occupy at the mount, and for 2 showls as iron shod to fill the wheelbarrows in the masons lodge, price the pece vid.—TEMPUS FUGIT.

## GRAPE GROWING.

THROUGHOUT life we have found that the gardeners who produce good desserts are, generally speaking, held in high esteem by their employers, and have no difficulty in finding good situations for young men trained under their care. Some thirty-six years ago Mr. Davis of Oak Hill (a small place), East Barnet, was a noted grower of fruit under glass and an exhibitor. Some noblemen of England coveted and engaged his men. Mr. Meredith of Liverpool came to the front and won a great name as a Grape-grower for many years. Younger men have appeared at some of our great horticultural fêtes of late with Grapes surpassing in weight and appearance all former productions—in reality perfect marvels of culture. All honour to these younger men for their great success and example. For exhibitions both large bunches and berries of Grapes are necessary. For private and family uses moderate-sized bunches with large berries are perhaps the most desirable. The largest berries, I might say the best Grapes, I ever saw were Muscats grown on old Vines at West Ella, near Hull. The bunches were not large—I guess about 2 lbs. each—but more tempting and covetable fruit never fell under my eye.

Vineries may be erected as spans, half-spans, or lean-to's; and in any and all of such houses good Grapes may be grown. The construction of houses for this work is of less importance than the formation and composition of their borders; but on the score of cheapness and convenience I prefer span-roofed houses running north and south, so that their east sides have the morning sun and the west the afternoon rays.

If convenient, Vine borders should be made both inside and outside, and be connected by open arches, thus giving the roots freedom to run and feed in all directions within the limits of the borders. I say limits, for the better way is to confine the roots to their own border: if allowed to wander too wide or go too deep, who will predict success or permanent and satisfactory results? Vine borders should have hard bottoms and thorough drainage. The question of what kind of soil is best for Vines is a very wide one, and if a hundred successful growers were to attempt to answer it, perhaps no two of them would agree in everything. Sods from old pasture land well broken up and mixed with about one-seventh of its own weight of good stable manure will make a good border for Vines. Vines do better and continue to bear longer in soils rather heavy than light. Broken bones, lime rubbish, and charcoal in borders are helpful, but very good Grapes have been and may be grown without them.

Vines are generally propagated from eyes or buds with about half an inch of wood or stem on either side of the buds; but I have never seen or known any good reason given why cuttings, technically so called, are not used instead of eyes. There is more nutriment in a cutting to support the bursting bud than there is in the eye. Certainly the strongest Vine I have yet seen grown in one season was from a cutting; and I have seen as strong and eligible Vines for planting grown from the cuttings of the green wood of started Vines as from eyes. These green shoots were struck like *Verbenas* or *Fuchsias* in a cutting pit, and made excellent strong short-jointed canes. Vines, then, may be grown from eyes, or shoots, or green wood.

Of late years it has been found that Vines which have been planted in the borders as soon as the plants were large enough, have done better than those that had been grown one and two years in pots. This discovery is of considerable importance, for now anyone may strike his own Vines, plant them when 6 or 8 inches high, and see his vineyard filled with beautiful rods well ripened before the end of the first year. Amateurs as well as experienced gardeners are now doing this. Grape-growing has been simplified and made easy by intelligent men of late years.

Vines so easily raised or struck are now planted doubly thick, so that every second Vine—termed supernumeraries—yields a crop of fruit at the end of the second season from planting, and the permanent Vines are permitted to strengthen and grow for two years before they begin to bear. Four feet asunder is about the best distance the permanent Vines should be planted, and the wires should be at least 16 inches from the glass. If planted too close, or tied up too near the glass, there will be danger of the leaves being too crowded. Vines like plenty of light, warmth, air, and moisture. The beginner in Grape-growing, for whom these lines are penned, will learn more from experience and observation than from letters or treatises on Vine culture; but reading such treatises will tend to open his mind for observation.—A. PATTIGREW.

#### CATERPILLARS VERSUS GOOSEBERRY BUSHES.

I quite agree with your correspondent "BETA" respecting the crops of Gooseberries being unusually heavy this year, but as far as my bushes are concerned I have never been less troubled with caterpillars, for I have only seen them on two bushes, and I grow between twenty and thirty pots. In this neighbourhood Peas, Potatoes, Plums, Cherries, Gooseberries, &c., are sold by the pot. A pot of Gooseberries is 90 lbs. of fruit, and the pot-hampers average 10 lbs. each. I attribute the absence of caterpillars to having the bushes well dusted over with quicklime and soot in winter (which will partly confirm the remedy recommended by "BETA"). This I had done to prevent the birds picking-out the buds. The bushes were all covered over white, and likewise the ground underneath.

The old saying is "Prevention is better than cure," and if this prevents the caterpillars I shall certainly use it for the future; but at some future season perhaps the caterpillars may defy all our dustings, and put in an appearance with a determination to strip our bushes entirely of their leaves. Should they do so I have an infallible remedy to recommend, which I have used for years. The first time I saw it used was in a garden ten miles north of the Grampian Hills, where I served my apprenticeship, and I have used it with perfect success when necessary ever since. It is white hellebore powder.

Where there are a large number of bushes to go over I get about half a pound and mix in a bucketful of water, and

sprinkle the bushes all over until the leaves are quite wet, and it is sure death in about an hour after being applied. The alleged cure "BETA" saw adopted in the lake district—viz., that of letting all the weeds and grass grow up amongst the bushes, would not, I am afraid, be tolerated in a well-kept nobleman's or gentleman's garden, but the above remedy I can guarantee effectual and in no way unsightly.—J. ANDERSON, *Hill Grove*.

#### NON-POROUS POTS.

FROM experience I can say that *Camellias* will thrive in these, having had some very large trees of *Camellias* in pots made at the Sanitary Tile-works; they are glazed, and apparently impervious to moisture. The plants have been in these pots for years now, and are likely to remain for years to come. They are in perfect health, and begin to expand their blooms in November, and give us a regular succession to the end of April, and are the admiration of all who see them.

I believe that many plants suffer as much or more from injudicious watering than from most other causes. I think that watering is as little understood as any branch in our profession, and is frequently as carelessly performed. I for one should be glad to see from the pen of any of our leading men an intelligible rule to know when a plant in a pot should be watered.

I have often stood to admire the plants in our cottagers' windows in their jars and spoutless teapots. With what glee do they often tell me what a favour it was to obtain a slip of such a *Geranium* and such a *Fuchsia* from Mr. So-and-so's garden, and how anxious they are to know the kind of soil most suitable for their pets, and how often to water them. They need encouraging in the management of their window pets, and garden plots too, for some of them are ready to make the colour rise to one's cheeks to see and hear the interest they manifest in these things as the cottagers' show approaches.—OBSERVER.

#### THE BELLADONNA LILY.

*AMARYLLIS BELLADONNA* is a native of the Cape of Good Hope, from whence it was introduced in 1712. In Italy it has long been extensively cultivated, where it grows as freely as it does at the Cape. It was in Italy that the specific name of *Belladonna* was given, the generic name *Amaryllis*—a beautiful woman immortalised by Virgil in one of his poems—was given by Linnaeus. "It was," says Herbert, "the exquisite blending of pink and white in that flower, as in the female complexion, that suggested the common name in Italy, and to those lovely tints Linnaeus referred when he assigned the name of a beautiful woman."

This fine old Lily is perfectly hardy, and when planted in a row at the foot of a south wall, and left to take care of itself, it will flourish to perfection. It is only in a few old gardens where such rows are to be found; but wherever seen none can dispute their beauty. For extensive out-of-door decoration the bulbs should be planted in June, to be divided and the soil renewed about every six years.

*Belladonna* with *Guernsey Lilies* (*Nerine sarniensis*) are also extensively cultivated in pots for greenhouse and conservatory decoration. For this purpose bulbs are imported in large quantities annually, and are offered at a cheap rate by all the principal dealers; and although, as a rule, the flowers are not nearly so fine as are those produced by bulbs established in the open air, yet they create a charming effect when mixed with the foliage of other plants (for they have none of their own) in the autumn months.

Importations of these bulbs generally arrive about the end of the present month or early in September, and have the flower-scapes not only formed but ready to burst into beauty. On this account the vendors have good reason to urge on their clients the advisability of giving their orders early—advice which is good for vendors, growers, and bulbs, for if it is not heeded the flowers are lost or the bulbs do not arrive in the condition which a grower naturally expects. If he "orders early," however, he may generally depend on most of the bulbs unfolding their beauty shortly after they reach his hands, but it is seldom that all of them will do so, as they are at all times liable to delay in transit, and some of the scapes may be imperfectly developed. It is as well to recognise these contingencies when ordering the bulbs, and to order a few extra as a margin for a possible failure; that is the only safe plan to insure a display.

On the arrival of the bulbs they must be potted immediately. They must not be put aside for a few days for a more convenient opportunity, or the delay of these "few days" may be a fatal delay, for which most likely the sender of the bulbs and not the receiver will have unjustly to bear the blame of the failure. The bulbs may be potted one in a small pot or several in a large pot, according to taste and the effect desired. The soil may be any ordinary mixture of loam and leaf mould or cocoa-nut fibre refuse, and the pots should be placed in a greenhouse or frame. The bulbs should not be wholly covered with the soil, and they must be watered carefully and sparingly, for a plant without roots or foliage plainly requires but limited supplies of water. If a portion of these bulbs emit roots,

which all will not do, foliage will form and water must be increased to perfect it, and the plant then becomes established, and will, with proper treatment, bloom year by year.

For these established plants a sound pure loam is the most suitable soil. They should be kept cool, and be carefully watered during the winter; but in the spring, when the foliage is developed, they require to be watered freely. In May water must be withheld, and the pots should be placed in a hot sunny place, and have no water given them until August. A moist spring, dry hot summer, genial autumn, and a temperate winter are the conditions suited to this type of *Amaryllis*. When the pots are filled with roots the plants seldom require to be repotted, as they are kept in health and under command

Fig. 35.—*AMARYLLIS BELLADONNA*.

by a proper system of watering and temperature, which governs the periods of excitement and rest.

But it is in permanent broad rows in the open air that the fullest beauty of these charming Lilies is produced, and next to that, perhaps, are the spikes from bulbs imported in good condition and potted just at the right time. Their imposing and lovely-tinted flowers are always enjoyable whether growing or used as cut blooms for the decoration of vases, for which purpose they are admirably adapted. They associate perfectly with Guernsey Lilies, and both are worthy of cultivation and special attention at this period of the year.

The old variety of the Belladonna can be purchased at a cheap rate, and for cultivation in large numbers it is recommended. Its colour is a delicate silvery rose, and it is very fragrant. The spikes grow  $1\frac{1}{2}$  to  $2\frac{1}{2}$  feet in height, and are surmounted by six to twelve delightfully-scented flowers. Handsome hybrid forms are also offered, varying from pure

white to purple and crimson-striped flowers, all of which are worthy of cultivation notwithstanding that they are destitute of foliage at the principal period of their attractiveness.

By drawing attention to this popular species of *Amaryllis* at the present time it is hoped that a seasonable hint may be conveyed, leading to a more certain enjoyment of these charmingly-tinted and imposing autumn flowers.—W.

#### THE WHITE WILLOW (*SALIX ALBA*).

"SIR," said an old medical practitioner, "Providence points out that the bark of the White Willow yields an antidote for intermittent fevers; it flourishes where they most prevail." We will not dispute the logic of that inference, but it leads us to observe that on high grounds as well as in the low-lying well-watered nooks of many parks we have noticed how highly ornamental they were rendered by groups of this Willow. Yet

this Willow is associated with sadness, and was so even in the days when the Israelites were captives in Babylon. "It is a sad tree," says Fuller, "whereof such who have lost their love make their mourning garlands, and we know what exiles hung up their harps upon such doleful supporters. The twigs hereof are physick to drive out the folly of children. This tree delighteth in moist places, and is triumphant in the Isle of Ely, where the roots strengthen their banks, and lop affords fuel for their fire. It groweth incredibly fast, it being a byword in this county that the profit by Willows will buy the owner a horse before that by other trees will pay for his saddle. Let me add, that if green sabs may burn before a queen, withered Willows may be allowed to burn before a lady."

Let London say more about its uses—"In the north of Europe the bark of this tree is used for tanning leather and for dyeing yarn of a cinnamon colour; and the leaves and young shoots are given to cattle in a green state, or dried like the twigs of the Birch, and laid up for winter fodder. The inner bark, like that of Scotch Pine, being kiln-dried and ground into a fine flour, is mixed with oatmeal and made into bread in seasons

handles to rakes, hoes, and other implements, and as faggot wood for fuel. The timber of the trunk is used for various purposes. It weighs in a green state 70 lbs. 9 ozs. per cubic foot; half-dry, 51 lbs. 14 ozs.; and quite dry, 32 lbs. 13 ozs.; so as to lose more than one-half of its weight by drying, during which it loses a sixteenth part of its bulk. It is found an excellent lining for stone-carts, barrows, &c. It is used in turnery, millwork, cooperage, weather-boarding, &c.; and the stronger shoots and poles serve for making hoops, handles to hay-rakes, clothes props, and various other instruments and implements, and the twigs are employed in wickerwork. The bark, which is thick and full of cracks, is in nearly as great repute for tanning as that of the Oak; and it is also used in medicine, in the cure of agues, as a substitute for cinchona, though it is inferior for both purposes to that of *S. Russelliana*. As fuel the wood of this tree is to that of the Beech as 808 is to 1540; but the old bark makes a very useful fuel, and both it and the wood will burn when green, in which state the wood is said to give out most heat. The charcoal is excellent for use

in the manufacture of gunpowder and for crayons. The ashes are very rich in alkali, containing more than a tenth part of their weight of potash. In France a fine blood-red colour is

Fig. 25.—THE WHITE WILLOW (*SALIX ALBA*).

Fig. 27.—Male Catkin.

of great scarcity by the inhabitants of Norway and Kamtschatka. The branches of the tree are used as stakes, poles,

obtained from the bark, and that of the young tree is used in the preparation of leather for making gloves.

Fig. 28.—Female Catkin.

"It is justly remarked by Mr. Gorrie that it adds much to the value of the *Salix alba* that its propagation and culture are of the most simple description, and that it will grow luxuriantly in most soils where other trees make but slow progress. According to Sang it will thrive well in high and dry grounds; and if planted in the grove manner in tolerably good soil, perhaps no other plantation except Larches would give so quick a return for the trouble and expense of planting."

The flowers are in catkins, the males by themselves and the females by themselves. Examined by the microscope, especially at the time of pollen-shedding, they are very beautiful.

Although no admirer of Willows generally, Gilpin makes one exception in favour of the White Willow. "Some," he says, "I have thought beautiful and fit to appear in the decoration of any rural scene. The kind I have most admired has a small narrow leaf, and wears a pleasant light sea-green tint, which mixes agreeably with foliage of a deeper hue. I believe botanists call it the *Salix alba*." We have seen many so made use of; and as this Willow will flourish on a dry soil, though its growth there is not so fast as in wet ground, if placed forward on projecting parts of plantations and dark-foliated Beeches at the inner parts of the retreating portions, the effect is greatly increased.

This Willow is so generally pollarded that few of our readers know it in its beauty, yet we have seen many fine specimens and have heard of far more. Dr. Johnson visited one whenever he went to his native place, Lichfield. It grew close to the premises where was his father's parchment manufactory. Its trunk at the base was 15 feet 9 inches in circumference; it was 49 feet high, and its fifteen branches overhaded 4000 feet of surface.

Then there is, or was a few years ago, the still finer "Abbot Willow" at Bury St. Edmunds growing on a part of the abbey domains; the height 75 feet, the circumference of the trunk 18 feet 6 inches, and the branches shaded a circle of more than 200 feet circumference. There is a portrait of it in Strutt's "*Sylvia Britannica*."

### BASKET PLANTS.

BEFORE referring to the plants I may state that I have confined myself to what I consider plants suitable for suspended baskets. The basket-like vases, made of split wood and set in the conservatory or flower garden, I regard as true vases, therefore I speak of them as such. Baskets are very various in form and design, some being made of earthenware, some of wood, and others of wire, the last being my favourites. Their form and material of construction are simply matters of taste, but I would suggest that the baskets be made with a greater view to the well-being of the plants to be grown in them than to their own ornamentation. When the plants grow luxuriantly they almost or entirely hide the baskets; then, what is the advantage of those which are costly over those which are plain? Sufficient means of drainage should in every case be provided, especially as regards the close-sided bowl-shaped sorts, for when the woodwork is open, or wire netting used, nothing short of very bad filling could insure bad drainage. Line the inside of wire baskets with a layer of sphagnum, within which put the soil; when filling and planting is finished, take a pair of shears and clip off evenly the ragged sphagnum. As regards the baskets most suitable for the parlour, I would recommend the close-sided kinds that have little drawers at their base for holding the spare water, and thus preventing it from spilling on the floor. These drawers should be emptied daily when the parlour is being cleaned and before the flowers are watered again, otherwise an overflow and spilling may be the result. The soil to be used just depends on what the owner has convenient; indeed, I think many foolish composts are advised for plants. Some people recommend two parts of loam with one of dung for a class of plants, and others may use some peat and leaf soil besides for the same subjects, which in both cases may equally luxuriate; then we are at a loss what to choose.

I find that most plants grow well in good loam—turfy, if to be had—and a little leaf soil or light decayed manure added. Peat I do not consider a decided necessity for any genus of cultivated plants exclusive of Ferns and Orchids, and even many of them grow well without it. Rhododendrons are considered peat-needing plants, but the Messrs. Lane & Sons, England, grow hundreds of thousands of these in the very best of health, and the most floriferous condition, in the pure sandy loam of Berkhamstead Common, where there is not a particle

of peat. Leaf mould is a good substitute for peat, and it is nourishing, open, and liked by most plants.

I am no advocate for mixing sand in the compost; in fact, I partially agree with Mr. Croucher, the great succulent-plant grower, who considers sand in many cases a plant-killer. It is useful in propagating for very young plants, and for some Ferns, Lycopods, Orchids, Heaths, &c.; but for general plant culture I depart from the opinion and practices of my apprentices and journeymen masters, who thought its presence a necessity. Clayey soil should not be used, or anything that is clammy or binding. Make the soil sufficiently fine by chopping or breaking between the fingers, and avoid the use of the sieve. Cast away worms, stones, and sticks. Place some of the roughest of the material or a thin scattering of sphagnum over the crocks to keep them clean and in good working condition.

Examine the baskets every afternoon in order to supply their wants as regards water, and use rain water in preference to any other. If the soil becomes very dry steep the basket in a tub or pail of water, otherwise the inner portion of soil may be quite dry even after frequent applications from the watering-pot. If the watering be done in the morning, and a hot sunny day ensuing, the water soon dries up without doing much good; but if done in the afternoon it will remain in the soil till next day at least, and then give full benefits to the plants. When water is given give it abundantly, and do not scruple about using the syringe to clean off dirt or insects, and to refresh the plants. About 4 p.m. is a good time for syringing.

The arrangement of the plants in the baskets is entirely a matter of taste; but care should be taken to have a good permanent plant in the centre, with dwarfier plants or trailers surrounding it. Little specimens of Myrtles, Indiarubber Plants, stiff Ferns, Palms, Crotons, Dracenas, Cyperus, Acalypha tricolor, Zonal Pelargoniums, or, in fact, anything there is to spare may be used as a centre.

**ABUTILON VEXILLARIUM VARIEGATUM.**—A free-growing greenhouse plant with pretty yellow-blotched leaves and numerous short-stalked red flowers, the visible portion of the corolla being bright yellow. This plant may be used advantageously in large baskets amongst other plants, as alone it would have a naked appearance. It is readily increased from cuttings of the half-ripe wood. Small plants of this *Abutilon* make fine edgings for flower beds if pegged down, and in this way they are much used in the London parks.

**ACHIMENES.**—No one who has seen the immense baskets of these at Chatsworth, England, the seat of the Duke of Devonshire, could fail to be surprised at their splendour. There in the Victoria Regia house, and suspended from the roof over the spacious tepid water tank, are large wire baskets filled with *Achimenes* that grow with such dense luxuriance as to form specimens 6 feet in diameter, one mass of flowers, and completely enveloping from view both top and bottom of the baskets. Such samples of culture, however, are too clumsy for the general public, and I will therefore give the method practised by the fine old London firm of Osborn & Sons, that now directs attention to house-furnishing or floral-decorating. Ten or 12-inch-wide wire baskets are chosen, and the *Achimenes* planted therein in the bowl and between the wire meshes, the plants being previously started in pots. The baskets are then suspended in a warm greenhouse, and daily syringed in the afternoons. As the plants grow they are pinched to induce laterals, which are also pinched, and this pinching is continued till a perfect circular thicket nearly 3 feet through is produced, when they are permitted to come into full bloom. They are stove or warm greenhouse plants, propagated as freely as *Verbenas* from cuttings; but the usual method is by means of their scaly tuberous "roots." Completely rest them in winter, and start them in heat the following spring. A few good sorts for basket work are *Longiflora alba*, *L. major*, *Mauve Queen*, *Vivicans*, *Stella*, *Argus*, *Leopold*, *Edipae*, and *Pink Perfection*.

**ESCHYNANTHUS.**—Most of the cultivated species of these may legitimately be grown in baskets in the stove, and they thrive best in a moist shady nook. I have seen *Æ. Lobbianus* cover the most of the back wall within a stove in Messrs. Veitch's Nurseries, Chelsea. They are very free-flowering, having long-tubed or club-shaped fleshy flowers of a red or crimson shade of colour. Their leaves are also fleshy and stems pendant, and in their native habitats they are of epiphytal character, being chiefly found growing on trees. They like an open spongy soil, and they are easily increased from cuttings. I like to see them sole occupants of small baskets. A few of the best are *Æ. speciosus*, *Lobbianus*, *longiflorus*, *bicolor*, *javanicus*, *cordifolius*, and *pulcher*.

**ASTYSTAIA.**—When at Kew some years ago we had a very fine basket plant of this genus, but I forget its specific name. It was an herbaceous plant with fragile stems that depended some 12 or 15 inches below the baskets, and thickly laden with whitish funnel-shaped flowers. We grew it in the tropical aquarium and stoves.

**BEGONIA GLAUCCOXYLLA SCANDENS.**—This is decidedly one of the best of plants for growing alone in a suspended pot or basket. I prefer the pot. It produces quite a compact drapery of green, depending for some 20 inches below the pot, each branch being tipped with a cluster of bright red waxy flowers. The finest specimen I ever saw of it was at Mr. Such's nursery, South Amboy, N.J.; but Mr. Taplin complained to me that it did not flower so freely as he would wish, but always kept on growing. This is quite contrary to my experience of it, as we had a plant of the same from Such's some two years since, and so determined is it to bloom that it is with difficulty we can obtain a cutting from it. It is partial to a stove or warm greenhouse temperature. This is the only Begonia that I can confidently recommend for this purpose, for no matter how fine the numerous other species and garden hybrids may be for pot culture, they are unequal to this one for basket work.

**CISSUS DISCOLOR.**—A climber or trailer of good constitution, its leaves being extensively coloured. It is an excellent subject for large baskets in stoves, but for window or cool-house work it is not very satisfactory. It propagates so readily from cuttings that every joint will make a plant. It requires partial rest in winter, and at no time to be subjected to a temperature under 40° or 45°, to be cut well back late in autumn or winter, and started in a brisk temperature in spring. Under ordinary circumstances the best way to grow this plant is to train its shoots on strings along the inside of the sashes, and then leave it till it has nearly finished growing, when the strings may be cut and the vines trained around a trellis.—W. F.—(*American Gardener's Monthly*.)

### HERB GARDENS AND NO BEES!

THE market gardens around the metropolis have long been famous, not only for producing the best vegetables possible, but for producing them in abundance. To do this it is necessary to have a great amount of experience, and the necessity of such experience has resulted in certain vegetables and herbs being grown almost exclusively in certain districts. At one time an area lying between Kensington and Brompton was largely devoted to the cultivation of Lettuces and Cauliflowers, more especially early ones, for which there has always been a great demand, and which always command remunerative prices. The rapid growth of the metropolis, which encroaches year by year most perceptibly upon the green fields and open spaces of the suburbs, or the cheaper and more rapid transit by rail, has done away with market gardens so near the centre of the town; the earliest Cabbages, Cauliflowers, Lettuces, &c., are now sent from Cornwall and the Scilly Isles, and it is only the more distant market gardens which retain their original characters. Mitcham is one of these: its open fields, lying fully exposed to the summer sun, are still covered each year with fragrant herbs and flowers, although the greater part of the acreage is devoted to medicinal or aromatic plants, yet there are greater breadths of savoury pot herbs, and sweet herbs for culinary use. The cultivation of these latter is here, however, not so extended as it is in the market gardens of Fulham, where Lemon and common Thyme, Sweet Basil, Marjoram, and many other aromatic ingredients for stuffing or soup are largely grown, especially for sale at Covent Garden Market. On hearing of acres of Lavender, Peppermint, &c., visions of rural beauty, peace and plenty, naturally arise, and if we do not expect to see a perfect arcadia in the village with such sweet surroundings, at least we expect homely comfort. Mitcham, with its acres of beautiful common, extending as far as the eye could reach, with its hundreds of acres of aromatic plants, presented no unusual picture of rural prosperity; in fact rather the contrary. It scarcely presented, that is to say as far as the cottages and their entourages were concerned, the pleasant appearance of an ordinary English hamlet. There was an air of untidiness, a want of that knowledge which makes the best of everything, apparent even to a stranger. Most of the cottages had gardens, not very extensive ones perhaps, but large enough to grow flowers, herbs, and hold a stand of bee hives; yet the plot of ground was in general not at all, or very indifferently, cultivated, and a prolonged tour

of inspection around the place did not show us a single bee hive! Hundreds upon hundreds of acres of aromatic plants only harvested in full blossom, and not a single bee! Acres upon acres of common land, where the air was scented with the perfume of the wild Thyme, lying in beautiful purple patches at the feet, and not a single bee! During all our walk of many hours about the place we never heard the happy hum of this busy worker for man's benefit. Are the villagers of Mitcham asleep that they do not see what a mine of wealth lies before their doors? Are they so indifferent to worldly prosperity that they do not care to increase their means, and thus increase the comfort and happiness of their homes? or are they so little versed in rural economy as never to have heard of the profitable keeping of bees? Neither the exteriors, nor the glimpses we caught of the interiors, of these cottage homes of England bespoke too much comfort, and yet fields full of blossom, each blossom bearing in its nectary the drop which might become honey, were wasting their sweetness, if not on desert, yet on unprofitable air, while the workers amid all that sweetness toil for the miserable pay of the rural labourer, and never see that they might obtain comfort, if not plenty, by availing themselves of those resources which nature has spread so plentifully around, and of which anyone might avail themselves by the exercise of the very smallest amount of trouble and care.

Agricultural labourers cannot keep fowls nor rabbits; such live stock is forbidden by harsh masters on pain of dismissal, and they do not keep bees. The most inveterate money-grubber who ever breathed would surely find no excuse for forbidding a man to erect a stand of hives at his cottage door; he could not lay an embargo upon the nectar which fills each blossom of Bean or Clover. There could be no inducement to petty larceny to find food for bees. The industrious insects find their own sustenance, they rifle the wild flower of its sweets, and what they take from the farmers' fields is never known and never missed. Should prolonged wet or cold weather compel man to give them a little food during winter, he does not return them one-twentieth part of that which he has taken during summer. Yet there is scarcely a hamlet in England where the number of the hives could not be counted upon the fingers of one hand. We live in the midst of fertile fields. Our Gorse and Heath-covered commons might prove a mine of wealth for the industrious poor living in their vicinity; yet the Gorse flowers more or less from the commencement to the end of the year, the Heather blossoms unprofitably on the plain, they distil their sweetness to the winds alone, save for the modicum of nectar gathered by the few wild bees who seek from them their store of food.

We pay thousands of pounds annually for honey and wax garnered by the careful French peasants, while such money paid for the fruits of home industry would elevate the social status of the rustic toiler, and add to the prosperity of the whole country. All money spent upon imported food is a confession of weakness; a nation which does not feed itself dare not resent an affront, a sudden stoppage of foreign supplies would leave the bulk of the people in a state of starvation.

With thousands of acres of wild heath and woodland, only utilised to provide game for the sportsman's gun, and which do not help one iota towards cheapening food for the people, we go on from year to year; we import our beef and mutton, we import our poultry and eggs, and we import our honey!—(*The National Food and Fuel Reformer*.)

### NOTES ON VILLA AND SUBURBAN GARDENING.

**CARNATIONS AND ZINNIAS.**—Taking plants for ease of culture and an abundant return in the way of flowers, there is scarcely anything more worthy of recommending to an amateur's notice than the above. The different varieties of Asters are also commendable, but there is not that abundance of bloom that the two former give. From a packet of mixed seed of *Carnations* there come numerous double flowers of more or less merit and perfume; and even some of the single ones—some of which must be expected—are thoroughly useful in the vase or flower-stand when out; and they all have the merit of lasting in this way a much longer time than many flowers of a choicer character. Twelve months ago last March I advised an amateur to purchase of a well known seedman a packet of *Carnation* seed at 6s., and he sowed the seed under two handglasses on a bed of made-up soil. In due time the seedlings came up, and were pricked-out on another bed till they were large enough to finally plant out on a properly prepared bed consisting of at least 18 inches in depth of common garden soil, with fresh loam

and rotten manure added; they became well established before winter, and made thoroughly good plants. In the spring of this year they threw up so many flower stems, and produced such a numerous quantity of buds on each, that I advised the thinning-out of both flower stems and buds to a great extent. The result has been a mass of a variety of bloom of more than ordinary merit. Now, instead of staking every shoot, the plan adopted was to place stakes round the bed in one row through the centre. Fine string was then connected in different courses one with the other, and the flower stems fastened to the string with matting; therefore, instead of seeing a forest of sticks to mar the effect, which would be objectionable, nothing of the kind was seen, as the string was quite invisible, and the flowers well supported.

Of the old-fashioned flowers called the *Zinnias* too much can scarcely be said in praise of them as decorative border plants. A packet of seed produces a good percentage of beautiful double flowers of great brilliancy and variety of colour. It is perhaps more of an autumn-blooming plant, but its mode of culture is so simple and yet so successful that I must plead for this plant to be taken in hand more than it is. A packet of seeds costs from 2s. 6d. to 8s. 6d. They may be sown at the same time and in the same manner as the Aster and Stock, and the after-treatment is also similar. If the plant itself is staked the individual flowers support themselves. Give it a rich soil and the flowers come fine.

Of *Asters* there are several so-called varieties, which after all are very similar; but there is a selection called Betteridge's Quilled which are worth growing, and would be more so if the habit was not so straggling. They do not carry enough foliage to look well when growing. Among dwarf *Asters* there is the one called the *Chrysanthemum* which does not exceed 1 foot in height—a capital sort for small beds and for pots, and it does not look amiss in a ribbon border.—THOMAS RECORD.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### HARDY FRUIT GARDEN.

This is now a busy time in this department, for even in a moderate-sized garden a man is constantly required amongst the trees. It is well to be very careful in gathering all sorts of fruit, although when work is pressing the earliest sorts that keep but a few weeks is not handled quite so carefully as sitting eggs. That intended to keep for months must be carefully handled; a little dry hay should be placed in the bottom of the basket, and the fruit carefully placed in by hand. We collect all fallen Apples and Pears at once, as the largest proportion of the fruit contains maggots. The fruit is ready for gathering as soon as the pips become brown at the core. It is a good plan to rake the ground under all standard and wall trees. We have a fancy that the fruit is of better flavour when the ground is stirred and kept free from weeds. An explanation of this may be found in the fact that the leaves of weeds absorb the heat of the sun's rays and do not give it back, whereas the ground, especially if stones are on the surface, absorbs and gives back much heat; for this reason it is very undesirable to sow or plant late crops on the fruit borders. All such crops ought to be removed by the end of July, and the borders should be kept quite neat and clean afterwards. We generally go over Apple and Pear trees at this time and stop any shoots that are taking the lead, removing at the same time superabundant growths.

It is also necessary to look over Peach and Nectarine trees on the wall. All loose shoots ought to be nailed-in to allow of the sun acting upon the fruit, and, besides, it looks slovenly to see the young growths flapping about on the trees at this season. During the present hot weather the garden engine should be freely used until within a week of the time the first fruits would be ripe. Perhaps this last bit of advice may be taken with some qualification, for in soils suitable for Peach culture spider is not so destructive as it is with us, and if the trees are quite free from this pest the syringing may be discontinued earlier in the season.

Just a word about packing Peaches. We use boxes deep enough to take two layers of fruit. On the bottom of the box place a thickish layer of cotton wadding, then place each fruit on its bottom upon a square of tissue paper, then wrap each up and place a layer of them closely together in the same position in the box; two ledges should be placed in the box on which to rest the second bottom. The same process should be gone through with the upper layer. If the fruit has to be sent a distance so that it is likely to be turned over, some paper shavings ought to be placed over it. A strip of cotton wadding may be wrapped round each fruit if particular care is necessary, such as sending it to an exhibition.

We have finished planting out the Strawberries. The runners were ready two weeks ago, and would have been put out at that time if the ground had been ready. It gives the plants a considerable check if they become root-bound in the small pots. Sometimes, when the ground was not ready for the plants before

the end of August, they have been potted in larger pots with the best results.

### VINETTES.

The Vines in the early houses are very nearly denuded of their leaves, and when this happens so early in the season it is difficult to prevent them from starting into a second growth, which is very undesirable. The Vines do not usually start so freely at the time they are required to do so when unseasonable growths have been made. Even if the Vines are in good health and well covered with leaves it is best not to allow secondary growths to be made after this time of the year, therefore we pinch them quite out as soon as they are formed. The object now is to have the buds at the base of the laterals to become plump and thoroughly matured, for until this is done the work of the season is not completed. If the borders inside are dry they must be well watered, and the leaves kept free from insect pests by syringing. As many persons plant their vinerias in the autumn it may not be out of place to say a word about the best varieties to plant when it is intended to ripen the fruit in May or June. There is no difficulty in selecting a black variety, as no other Grape is at all comparable to the Black Hamburg for use during the summer months. The white companion to it has not yet been introduced to the public, and the raiser of such a Grape would be deserving of the very highest honours. Buckland Sweetwater is very much thought of by some, and when it is well grown the flesh is firm and the flavour is much esteemed by some good judges. As it has been grown at Loxford Hall no other white Grape except the Muscat is preferred to it, and until something else is introduced it will be the best for exhibition purposes. Next to it in appearance comes Foster's White Seedling: this is more generally useful even than Buckland Sweetwater, and is steadily working its way into popular favour. Golden Champion, and the more recent sort Duke of Buccleuch, are superior to either of the above if they can be grown; but the Vines are so delicate in constitution that they are not adapted for any but the most experienced cultivators, although a case of their doing well sometimes occurs where no special care has been taken of them. Then the fruit does not keep well, and the skin is so thin that the fruit is injured by draughts of cold air when other sorts would not suffer. But perhaps the most certain, and as regards flavour it is second to none of the above, is the old Royal Muscadine. This sort is as popular in France as the Black Hamburg is in England. In the late houses it has been necessary to look over the bunches to remove some decayed berries. It ought always to be borne in mind that the bunches should be well thinned out when it is intended that the Grapes are to hang late.

### GREENHOUSE AND CONSERVATORY.

We are now busy preparing plants for autumn and winter flowering. *Chrysanthemums* are now being tied and trained into the proper shape to form dwarf compact specimens, presenting heads of blooms regularly arranged. To do this the plants must be pinched and tied-down from the first. Our best specimens are formed from two-year-old plants, although as a rule the best blooms are obtained from cuttings struck in the winter or early spring months, and under good management the plants can be grown of large size. Exhibitors who grow for the metropolitan *Chrysanthemum* shows are required by schedule to have the plants with one stem only, except at South Kensington, where there does not seem to be any clearly defined rule, so that a number of plants have been placed in one pot so as to increase the size of the specimens. At the same time it is very doubtful if there is much advantage gained by the system of crowding three or four plants together. The experienced exhibitor very soon finds out the best treatment adapted to each variety. For instance, growing on old specimens causes the plants to flower earlier, and Venus, Lady Slade, and Princess Teck would be grown from the old plants; and Mrs. George Rundle, George Glenney, and the early flowering free-growing varieties from cuttings struck in January. Each plant will now have numerous growths, which should be tied closely down as soon as possible. Ours have already been tied; the shoots will grow-up again rapidly, but each shoot will have a bend in it about 6 or 9 inches from the flower bud when it forms, and at the time of training the flowers into their proper position the growths will bend anywhere. If the growths had not been tied-down half the shoots would snap off at the joints.

Pompons are regularly trained all through the season, and no sticks are required to support the flowers. Many persons who do not wish to exhibit cut flowers, wish to have a few good examples for their own enjoyment. It is now time to "set" the blooms. At this time a very small bud may be observed at the end of each growth, three shoots will also be formed close to the bud. If these are allowed to grow the bud will be barren, but if they are pinched-out the bud will grow and form an immense flower, some of the varieties as large as a breakfast-cup. Three flowers are quite a sufficient number to be grown on one plant. As soon as the buds are set liberal supplies of manure water will be necessary.

Zonal Pelargoniums are certainly a great boon to us for autumn

flowering; they make a very fine display until the Chrysanthemums are ready, and there is very great variety in the colours—pink, rose, scarlet, and crimson being represented in interminable shades; and then how easily they are grown! Anybody with a notion of potting a plant can grow them well, and what is perhaps as much in their favour as anything is their entire freedom from insect pests.

Hardwooded plants require to be watched for spider and mildew. Heaths are very liable to the attacks of this parasite. Erica Massonii, and all similar sorts with that peculiar cobwebby appearance on the leaves, suffer severely if not taken in time. The best way to apply sulphur is to lay the plants on their sides over a large sheet of paper and thoroughly dust the leaves and stems until they are quite covered with the powder. If the plant is then gently shaken the superfluous sulphur will fall on the paper and none will be wasted. If the plants are dredged, in an upright position the sulphur falls into the pot, and if it is not removed the roots are injured by it. On one occasion we were recommended to apply sulphur to destroy moss on the surface of some Camellia pots; it killed the moss and some of the plants, and others were much injured.

The Hyacinths will soon be potted for the earliest flowers. The bulbs should be potted as soon as they come in from the nursery, and the pots plunged somewhere in the open ground in leaf mould, or cocoa-nut-fibre refuse is good if it can be obtained. It will be time enough to pot the bulbs for late flowering about the end of October.—J. DOUGLAS.

### TRADE CATALOGUES RECEIVED.

Messrs. Sutton & Sons, Reading.—*Catalogue of Bulbous Flower Roots, Plants, &c.*  
Messrs. S. Robertson & Co., 33, St. Andrew's Square, Edinburgh.—*Descriptive Catalogue of Dutch Flower Roots.*  
William Paul, Waltham Cross, London, N.—*Catalogue of Bulbs, Camellias, &c.*

### HORTICULTURAL EXHIBITIONS.

SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held.

DUNDEE.—August 28th, 29th, and 30th. Mr. B. MacKellar, 51, Reform Street, Sec.  
WAKEFIELD.—August 29th. Mr. A. Holmes (Parish Clerk), Sec.  
CHIPPENHAM.—August 31st. Mr. Alfred Wright, Sec.  
DEAL AND WALKER.—August 31st.  
BATH.—September 1st and 2nd. Mr. B. Pearson, 13, Milcom Street, Sec.  
GREAT YARMOUTH.—September 2nd. Mr. S. Aldred, Hon. Sec.  
NITON AND WHITEWELL.—September 2nd. Mr. R. W. Berry, Hon. Sec.  
ALEXANDRA PALACE (International Fruit Show).—September 2nd, 3rd, and 4th. Mr. A. McKennie, Sec.  
SOUTH OF SCOTLAND.—To be held at Dumfries, September 3rd. Mr. J. Blount Dinwiddie, 11, Buccleuch Street, Dumfries, Hon. Sec.  
CRYSTAL PALACE COMPANY.—Autumn Fruit and Flower Show, September 7th to 9th.—Sec. E. W. Wilson. Bees and their appliances, September 21st to 23rd.—Sec. J. Hunter.  
GLASGOW.—September 8th. Mr. F. G. Dougall, 167, Canping Street, Sec.  
KILMARNOCK.—September 10th. Mr. M. Smith, 11, King Street, Sec.  
STAMFORD (BURGHLEY PARK).—September 15th and 16th. Messrs. Johnson and Laxton, Hon. Secs.  
LONE SUTTON.—September 22nd and 23rd. Mr. J. W. Swain, Sec.  
ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—September 23rd. Mr. A. J. Bennie, 123, Union Street, Aberdeen, Sec.  
ALEXANDRA PALACE (Potatoes).—September 29th and 30th. Mr. F. McKinnlay, 23, Upper Thames Street, London, Hon. Sec.  
JERSEY.—Autumn October 15th. Chrysanthemums November 10th. Major Howell, Spring Grove, St. Lawrence, Hon. Sec.

### TO CORRESPONDENTS.

\* \* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

ES\* We request that no perishable fruits be sent at present, as our authority for naming fruits is absent for a time.

BOOKS (St. Vincent B.).—To contain descriptions of all the varieties of florists' flowers would require a very large volume. Our "Florists' Flowers" contains small selections. You can have a copy free by post if you enclose five postage stamps with your full address.

VINE AND PEACH SHOOT DISEASES (H. F. Bradley).—We never saw trees so abandoned to disease. The Peach shoots are ruined by the turtle scale (*Aspidiotus conchiformis*). Bruise the shoots, without touching the leaves, with ammoniacal liquor from the gasworks. The Vines have been ruined by want of water and mildew. Water freely and thin out all the burst berries. We fear they are in a hopeless state for this year.

SALINE MANURE FOR POTATOES (C. L. D.).—If you refer to p. 184 you will see that the quantity of each salt for an acre is specified. We certainly should not mix them with farmyard manure, but sprinkle them on the surface just before the first hoeing.

MAY QUEEN GERANIUM (W. S. B.).—We think the specimens are of that variety, and as it is not a Tricolor that would disqualify the exhibit.

GEOTHERAS (J. P. A.).—The flowers were entirely faded. If you can propagate the pink sport it will be an accession, but we fear that you will find it not permanent.

WHITE EVERLASTING FLOWERS.—"A. B." finds they become rather brown in drying, and wishes to know if this can be prevented. If not, they may, before being used for decoration, be dipped into a weak solution of bleaching powder, which may be obtained of any chemist.

SNOWFLAKE POTATO.—Mr. C. Turner, gardener to H. Beaver, Esq., near Workop, says that 1 lb. of seed has produced 60 lbs.

FUNGUS (S. A. Brennan).—If you compare your plant with a specimen of the true Mushroom you will find the two to be very different species. For instance, your fungus has no ring round the stem, a character which is always present in the Mushroom, and the gills of your plant run down the stem instead of suddenly twisting up near its insertion as in the Mushroom. Your fungus is *Agaricus prunellus*; it is edible, and generally highly esteemed. (*Pineapple*).—The scientific name of the disagreeable fungus known as the "Wood Witch" is *Phallus impudicus*. We know not whether it is poisonous or not, but judging from its horrible and disgusting odour we should think it hardly worth a serious trial.

THRIPS ON VINES AND FERNS (R. H. F., York).—Yours is a very bad case, and you must have prompt recourse to remedial measures. In the first place remove the Camellias, Azaleas, Pelargoniums, and hardy Ferns, and stand them in a shady place out of doors, and there syringe them thoroughly, applying the solution to every part. When you have taken the plants from the vinery then syringe heavily the Vines, walls, woodwork, &c., with soft-soap water of a strength of 5 osts. per gallon, with a sixth part of tobacco water added. Do this on two successive evenings, and repeat the dose weekly for a month. By that means you may destroy the thrips which are devouring your Vines, and which will certainly do them permanent injury if not at once eradicated. The plants may remain in the open air so long as they are safe from frost and heavy autumn rains. Use the solution at a temperature of 100° and but little sediment will be left behind, and what little there is may be removed by a thorough washing with pure water very early the following morning. If the Grapes are ripe we would advise you to cut most of them with 6 inches of the wood attached, and insert in bottles of water and keep in a cool room. They will keep as well there as on the Vines in the state yours are. Better, however, that a portion of the crop be sacrificed than that the Vines themselves be destroyed by the myriads of insects affecting them.

FRUIT TREES FOR HOUSE WALLS (Selly Park).—A south-east aspect is not very good for Peaches or Nectarines. Violet Hâtive Peach and Violet Hâtive Nectarine are most likely to succeed. A suitable Apicot is Moorpark. The best Plums are Green Gage, Transparent Gage, and Coe's Golden Drop. The soil will suit the whole, it being efficiently drained; but we should plant with some good turfy loam three parts, and one part each of old mortar rubbish and well-rotted manure thoroughly mixed. The south-west aspect would suit a Pear—Made Louise, and the north-east would answer for Pear Jargonelle or Morello Cherry.

VINES FOR GREENHOUSE (Idem).—Three suitable kinds are Black Hamburgh, Madresfield Court, and Foster's White Seedling. If you can have a border of 8 feet or so inside the house in which to plant the Vines, the front wall being arched to allow of the roots passing outside, we should advise that in preference to all outside borders. Particulars for forming a border were given last week, page 167, in answer to "A. M. B."

STRAWBERRIES FOR SANDY SOIL (An Irish Subscriber).—Keens' Seedling, Sir Joseph Paxton, President, and Duc de Malakoff are with us the best upon light soil, also the one you name, Bilton Pine. They, upon such soil, ought to remain only two years, the ground being well trenched and manured, and the runners planted 2 feet apart every way as early in the season as they can be obtained. Of the four kinds named President does the best. Particulars of culture you will find given from time to time in "Doings of the Past and Present Weeks." The Birmingham brush-rake is a trade article; you will require to have one made.

WINTERING LANTANAS (Idem).—They succeed admirably if kept in a greenhouse with only water sufficient to keep the wood fresh, otherwise keeping them dry, and in February or March prune them well in, leaving a few eyes upon each shoot of last year's growth, and report when they have broken freely, having shoots about an inch long, and removing most of the old soil, return to the same size of pot, and keep rather close and moist, sprinkling overhead frequently until the potting is recovered, then afford a light and airy position. Young plants struck now will winter safely in a light airy position in a greenhouse, with water only to keep them fresh.

SEEDLING CYCLAMEN CULTURE (New Subscriber, Brighton).—The plants should be taken up carefully and potted separately in 8-inch pots, just covering the eorn with soil, or about a quarter of an inch deep, and after potting place them in a cold frame, keeping close, moist, and shaded from sun. If you have heat—a moist genial atmosphere as that of a hotbed or cool stove—they would be the better placed therein, and continued in it until they are advanced for flowering; but as you may not have those conveniences, continue them in the frame, admitting air moderately, and in October remove to the greenhouse. A compost of two parts turfy loam, half a part each leaf soil and sandy peat, with a sixth of silver sand, well mixed and made rather fine, but not sifted. Provide good drainage, and shift into larger pots as they fill with roots, but keeping them under rather than overpotted, and well supplied with water.

GREENHOUSE (Idem).—We could not select a greenhouse for you, but you may do so by referring to our advertising columns; or if you were to write to one of the horticultural builders stating what you wish, you would have designs and estimates submitted for your approval.

NERTERA SEAPANOIDES AND SIBTHORPIA EUROPEA VARIEGATA CULTURE (A Subscriber since 1856).—Both require to be grown in sandy peat soil with one-third of yellow loam, and to be in pans well drained so as to allow of the water passing away freely. Water very freely, never allowing to become dry, and keep in the shade, and winter in a cold frame or a cool greenhouse. In summer, or after May, the plants being well hardened off, success is best attained by growing on a north border or the northern side of rockwork, where they will be screened from direct sun and have the benefit which free exposure and the coolness with moisture afforded by the northerly aspect.

Both are very pretty, the former especially from its bright-coloured berries which studded over the moss-like carpet foliage are very effective.

**VINE LEAVES BROWNED** (*One in Fear*).—The air of the house has been, stagnant and dry, consequently the leaves are very severely scorched. Water the paths daily, and keep the top ventilators open all day and night.

**VINE LEAVES** (R. C.).—There was no mildew on the leaves you enclosed. They were healthy, and as the ventilation is well attended to you need only to keep the air moist by watering the paths daily.

**IVY ON WALLS** (*Della Bocco*).—The Ivy would not make the house walls damp, but contribute to their dryness, as may readily be observed by anyone when rain is falling, the rain being kept from the wall by the Ivy leaves throwing-off the water. We do not, however, advise Ivy for a south wall, partly from its doing best in the shade, and from the south aspect suiting other plants as *Eucallonia macrantha*, which has fine, evergreen, glossy foliage, and red flowers in summer; *Garrya elliptica* is also a fine evergreen and flowers in winter. For the north aspect no plant is so suitable as Ivy. For thickening the hedge under tall Elm trees the common Beech or Hornbeam would be most suitable, especially the former.

**TAMARIND** (A. B. C.).—The East Indian (*Tamarindus indica*), is a large spreading tree of about 60 feet in height, and the West Indian (*T. occidentalis*), is equally spreading, attaining to a height of 40 feet. They may be grown in this country in a large lofty house affording the temperature of a stove. Two parts sandy loam and one part leaf soil is a suitable compost. We do not know of its being fruited in this country, few having accommodation for so pretentious a plant.

**GATHERING SEEDS BEFORE RIFE** (W. W.).—All seeds are best left on the plants until they are ripe, but some plants do not ripen all the seeds at once; hence, as in grain, some are out when comparatively green but with considerable stem attached, and those seeds are as good, in fact germinate more freely and sooner than those left to mature upon the growing plant. The seed in such cases requires to be fully formed and kept in the husk or pod until hardened. Frenches are easily raised from seed, sowing the seed in light soil in spring, and placing the pots in a hotbed, the seedlings will be up in a few days.

**CLIMBERS FOR UNHEATED GLAZED VERANDAH** (J. A.).—You do not say what the aspect is, but we presume it is south, and advise accordingly *Bignonia capreolata*, *Berberidopsis corallina*, *Bridgesia spicata*, *Ceanothus asperus grandiflora*, *C. Gloire de Versailles*, *Jasminum revolutum*, *Lardis-bala biterata*, *Lonicera flucosa*, *Paeffera corulea*, *Solanum jasminoides*, *Buddleia globosa*, and *Stantonia latifolia*. All are evergreen, but we should not fail to have some deciduous, as *Glycine sinensis*, *Oleaster* of sorts, *Tea* and *Noisette* Roses, and for its fragrant *Chimonanthus fragrans*. A *Magnolia grandiflora floribunda* would do famously.

**SELECT CLEMATIS** (F. C.).—There are so many really beautiful varieties that we can scarcely make a selection of three of the best. White, C. Mrs. Quilter or Henry; blue or purple, C. acotiledon or nigricans. There is no "scarlet," but C. *vitellina rubra grandiflora* has bright claret-red flowers.

**SOWING ANNUALS FOR SPRING FLOWERING** (A. S.).—To flower early they should be sown from the middle to the end of September, but exceptions are *Silenes* and *Saponarias*, they requiring to be sown early in August, *Nemophila insignis grandiflora* last week in August, *Collinsia verna grandiflora* second week in August, *Limnathes Douglasi* first week in September, *Laethia californica* fourth week in August, all pricked-out in good light soil, shaded, and duly watered, moving with balls to the beds in autumn. *Myosotis sylvestris* ought to be sown in June and grown-on.

**REPOTTING LILIUM CANDIDUM** (*Idem*).—When the stems are yellow, the plants having died down, they should be turned out of the pots, all the soil not occupied with roots removed, and fresh compost employed for repotting, which may consist of three parts turfy loam, one part each leaf soil and sandy peat, and a half part each of old cow dung and silver sand, providing good drainage. They should be only moderately watered until the plants commence, and be kept from frost, but cool. We do not know of a method of keeping Cucumbers, only to pickle them.

**CUCUMBERS UNHEALTHY** (C. P.).—Your plants are much infested with green and brown aphides. Fumigate with tobacco or tobacco paper, and early the next morning syringe with warm water in which soft soap has been dissolved at the strength of 8 ozs. to each gallon of water. This will kill the insects, and the plants may afterwards be kept clean by regular syringings of pure water.

**NAMES OF FRUITS** (*Connaught Subscriber*).—Apples: 1, Not known; 2, Trumpington. The Plums were all decayed before we had an opportunity of examining them. (W. G.).—No. 1 is French Codlin; 2 is unknown to us. It is not Red Wine. It is a valuable acquisition on account of its earliness, and though not equal to Early Harvest and Irish Peach in quality, still ripening so early as the third week of July, it is valuable. Can you tell us anything of its origin?

**NAMES OF PLANTS** (*A Lady in Cheshire*).—*Alnus glutinosa laevigata*, Fringe-leaved Glammy Alder.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### POULTRY FARMING.

I HAVE repeatedly seen in reply to correspondents in your "Letter Box," and also to those in many of your contemporary papers under the above heading, that it has been tried in many places but was always attended with loss. My cognomen, as at the foot, has no doubt met the eye of many of your subscribers, amongst which are customers of mine, and who would, I believe, like to see into the proofs of the profit or loss of this business; and if through your columns you will allow those who have given their whole study to the subject—I mean as their only employment, and who have persevered against all difficulties—to give their experience, and if not too personal, an abridged copy of their Dr. and Cr. account, for I have kept mine for two years to a halfpenny, I shall be glad to submit mine in your first issue of September for the perusal and comparison of your readers. I

am sure it is a matter of interest to all poultry-keepers, and if you would kindly give publicity to these few remarks we shall be able to give healthy recreation and profitable employment to many who are now only deterred through fear of loss.

I have hatched and reared over 1400 head this year, and 1800 in 1874; and having, as I observed a few lines back, kept a daily and constant account, am in a position to give reliable and undoubted testimony as to whether it is always attended with loss or not.—GALLINACULTURIST, *Hampton-in-Arden*.

## BIRMINGHAM SUMMER SHOW.

AUGUST 20TH TO 28th.

THIS year this Show was vastly ahead of the *fiasco* of last season. The poultry were under a splendid marquee, and the Pigeons under a very long canvas-covered shed, in the grounds of Aston Park. In fact the weather made it the *beau ideal* of an outdoor show. There were nearly 800 entries of poultry and 600 of Pigeons. The management was ostensibly under a Committee, but we saw no one but Mr. Watts and the Secretary taking any very active part in the work, excepting one or two attendants. As before, we suppose it was really Mr. Watts's Show. The food was given by Messrs. Spratt, and we thank them, as without it the birds would have fared ill, for every pen was provided with Indian corn for their first meal on arrival—a most unwise thing. Billett's pens were used, and Drewitt kept his eye upon the arrangements, the bare idea of sawdust being put into the pens making him very active. Some of the classes were very large and should have had extra prizes, but such would be contrary to the ideas of the management, as we find where the entries were small the first prize was either withheld or the class extinguished. With such attendance, such a fine entry of birds, and liberal subscriptions, it ought to bear a handsome surplus; hence we are surprised at such meanness. The schedule is by no means a heavy one—there is far more show about it than anything else. For instance, where the first prize is a cup the value of the cup is paraded in addition to the first prize of £3, or whatever it may be, when in reality the first prize is a myth and is simply a false display of figures.

In *Dorkings* the first cockerel was a fine dark bird, good all round; second neat in style, and the other noticed birds mostly large and good. Pullets were not so fine as usual. The first was a fine bird, but she has one crooked leg; second was fine in frame, and third good. The first and second Silver-Greys were capital, and looking up a bit; third a fair White. In hens the awards were the same. The first *Cochin* cockerel, Buff, has at last gone ahead; he is a good square bird; second lighter, third a trifle mealy; highly commended (Lingwood) should have replaced him. In pullets, first a fine bird in full feather, second very fine all over, third similar. Messrs. Burnell and Lingwood also showed beauties. In Partridge, first a fine bird, but leggy and rather narrow; second better, except in hook; third wanting in style. In pullets all want pencilling; Mrs. Tindal's highly commended bird being the best. In White cockerels, first a big fair bird, second good but small, third leggy. Pullets were much better, the winners being great beauties, rest not so good. In Blacks the first pullet was the only good one, and she was a real beauty. *Brahmas* (Dark), first and second were well-known birds of rare colour, looking as though rest would improve them; third a fair bird, certainly not so good as highly commended (Hamilton), which will make into a beauty. As in the pullets we failed to find any really extraordinary birds. The cup pullet was in our judgment a poor one, and we failed to find the merit she possesses; second a fair bird, better in marking; third good. Surely the cup must have been intended for the next pen (Hamilton), a far better bird. Mr. Kendrick's was the best-marked of any; Miss Pennant's will also make a fine pullet. In Lights the cup went to a fine bird, very forward, good in leg, shape, and hackle, but a trifle yellow; second smaller, neat shape, but a bad hackle; third good in leg and comb, but also a bad hackle. Neither of these were so good as very highly commended (Dean), commended (Dean), or Mr. Dean's 224. In pullets a splendid class. First was a very good bird all over, but the second was better, her size and hackle were superior, and other points as good; third a good bird, not so white. Among other highly deserving birds were very highly commended and highly commended Dean, Haines, Petter, and Watson. In *Spanish* first was a fine lobed cock, second beautiful in face and lobe, third also very good. Hens were a grand lot, first being in the best order; second, third, and Messrs. Beldon and Allsop's capital. This was a grand class. Among *Game* the first Brown Red was very good, though not yet dubbed; the cup Brown Red pullet was also a beauty, superb in colour and style, but we really think the third Black Red was better, being almost perfect. The first Pile was a good leggy bird of capital quality, second a good Duckwing, third also good but too short in head. In the undubbed class the usual winners took the prizes, first being a rattling yellow-legged Pile. *Hamburgs* were small classes. In *Spaniels* first was a Gold getting out of feather; second a splendid Silver, which we preferred; and

third a chicken. In hens the winner was a grand Gold, second a good Silver, and third a fair Gold. In Pencils the cock class was minus, the catalogue stating that there was "no entry;" but this we know to be untrue, as we know of three being made; it, however, saved the Committee the prize money. In hens first was a Golden pullet, and a very poor one too; second Mr. Judson's well-known hen, worth fifty of the winner; and third a Silver. In *Polands* first cock was a splendid fellow, and far ahead. The winning hens were exquisite Silvers. In *Houdans* first was a splendid bird, very dark and good all through; second moderate, third good. Mr. Morris's bird was the finest of all if we except a very large comb. In pullets Mr. Morris again showed the finest, a great beauty. First was superb in colour and size, second fair, third very dark and good, legs black. *Crows* were a poor lot. In the Variety class first was a grand Malay in each class, second cock a Brown Leghorn with a very bad comb, third a far better White. In hens the White Leghorn was second and the Brown third; the latter was a fine bird with a good earlobe, but her colour was decidedly improper. In Game *Bantams* the cup Black Red was very good in colour and style, as was the first Pile, although we preferred the second. Pile hens were capital also. In the Sebright class the first cockerel (Silver) was a beauty, but he would be better for blacker lacing. The cup hen was a gem. Blacks were a good lot, and the Pekins shown were in nice order. White Ducks were a fair lot, but Rouens not so fine as we have seen. In Blacks first were the smallest, but second the best colour. In Fancy Ducks first went to Autumalis, second to Kasarkas, and third to Malagas. This was a fine class, all being noticed. In the Adult classes the winners were mostly well-known birds of the past season. Dark Brahma hens were a good class, as were Lights, but most of the birds were out of feather.

In Pigeons a splendid lot. The cup for Carriers went to a grand wattled Black, second grand in eye, and third a nice even bird. The first Dun was grand in eye and beak, second a good bird rather bad in colour, third a Blue. Hens were superb in both classes, the first Dun being rather flat in wattle. In young birds first was a beauty and most promising, being grand in beak. The Pouter cup went to a fine Black, second and third good Blues. The White hen was good in limb and girth. Barbs were a good lot; first a Red, second a Black, and first a Yellow in hens. The first young Barb we did not like, it being too long in beak. Almonds were a fine lot, as were Balbs and Beards, the first being a nicely-out Bald. Rosewings, Redbreasts, and Mottles were a fine class, the winner being a Redbreast Muff wonderfully out. In Fantails the winner was an easy first, being one of the best in head, neck, and carriage we have seen. In Jacks first was a Red, second a splendid Yellow with a better hood. In Turbits first was not good in beak and inferior to the second, and third Yellows. Mr. Dew's Silvers were clearly ahead, his unnoticed being, however, the best in the class. Nuns were a nice lot. The first English Owl was a beautiful headed Silver. In Africans, the pen (Fulton) next the winner was far ahead in size and beak, but unnoticed; third was not good in beak. Dragons were grand classes, as were Antwerps. The first Swallow was a delightful Yellow. Archangels were better than usual, and the Variety class excellent, first being a lovely Turbiteen, Mr. Ludlow's birds of this variety, his Damascenes and Blondinettes, being very perfect and interesting.

**DONKEYS.—Coloured.—Cockerel.**—1, T. C. Burnell, Michaldevor, Hants. 2, R. W. Beach, 3, L. Pilkington, Gatesara, Liverpool. **do.** W. H. King; W. H. Robson; L. G. W. Stratford; J. ### HOLMFIRTH SHOW OF POULTRY, &c.

THIS was held in the cricket field on August 1st. It was thought that the Show was in advance of its predecessors both in the number of entries and in the quality of a great proportion of the birds exhibited. We may take exception to the *Water-fowl* and the *Dorkings*, which were not up to the mark. The cup for the best pen was awarded to a very good pen of *Spanish*, and the cup for the best pen of *Pigeons* to a capital pen of *Carriers*. The *Hamburgs* in most of the classes were very good, both adults and young. The same may be said of the *Brahmas*, particularly the chickens. Some very good *Games* were exhibited, and with a little more age some of the chickens will be difficult to beat.

GEN.—1, J. Addy, Hey, Upperthong. 2, J. Roberts, Cliff.  
 Ducks.—Aylesbury.—1, J. Hey, Holey. 2, A. Thewlis, Maltham. Rouen.—1 and 2, J. Hey. As, G. H. Hirst, Maltham. Any other variety.—1, A. Thewlis. 2, E. Brook.  
 TURKEY.—1, W. H. Barber, Hinchiff. 2, W. Lodge, Lamma Wells.  
 DORKINGS.—1, E. Stringer. 2, W. Burtrey, Carr, Upperthong. Chickens.—1 and 2, J. C. Arkwright, Holmfirth.  
 SPANISH.—Black.—Cup and 2, J. Batty & Co., Nether Hillhouse. Chickens.—1 and 2, J. Batty & Co.  
 COCKER-ORPINGTON.—Cinnamon and Buff.—1 and 2, Moore & Cartwright, Holmfirth. Chickens.—1, J. Batty & Co. 2, J. Caldwell.  
 COCKER-ORPINGTON.—Any other variety.—1, W. Caldwell. 2, Moore & Cartwright, Holmfirth. Chickens.—1, J. Beaumont. 2, T. Blakey, Victoria, Holmfirth.  
 BRAHMA POUTERS.—1, Moore & Cartwright. 2, B. Lockwood, Malthamhouse. Chickens.—1, J. Batty & Co. 2, Moore & Cartwright.

 CATS.—Any variety.—1, Mrs. Heap. 2, W. Wright. 3, G. W. Blye, Holmfirth. 4, W. Holmes. As, V. McNish, Holmfirth.  
 JUDGES.—Mr. J. Dixon, Bradford.

### MEIGLE POULTRY SHOW.

THE tenth annual Exhibition of this Society was held on Wednesday, 18th of August. As this Show is the first in the district which offers prizes for chickens, it is of considerable interest to breeders, especially in a season such as this has been, when each is anxious to see if his neighbour has been as unlucky as himself. The classes were, with a few exceptions, not par-

into a deep moult. In Light Brahmas two really grand pens of chickens won first and second. They were really good all round. *Hamburgs* were all classed together. Fair Silver-spangles were first, and very nice Golden-pencilled second; the pullet very good in markings. In the Variety class a grand pair of Polanders were first, and a nice pen of Malays second. In *Bantams*, Game, Mr. Mayo won first with a nice pair of Black Reds. In the next class Blacks and Silver-laced won the prizes.

Rouen Ducks were good in colour and bills, but lacked size. A nice pair of Aylesburys won, but the drake's bill was a shade too dark, still Mr. Martin picked them out cleverly. In the variety Duck class Mr. Kelleway sent a nice pair of black ducklings, and won first. Geese were good, the first going to Greys, second to Whites.

Pigeons were small classes, but the quality good. Mr. Spencer of Hereford won in Carriers and Ponters with fine Blacks and Blues. In Pouter cooks a good Red won; second going to a capital White. Tumblers were fair, the prizes going to Almonds and Balles. The first pair of Antwerps were the only good pair, and in Jacobins extremely neat Blacks won. Fantails were good, but the Variety class contained the cream. There was pen after pen really good. The Judge picked out two good pairs of Barbs from the collection for the prizes, and highly commended nearly the whole of the rest of the class.

Rabbits were good, seventeen good Lops putting in an appearance. The ears of the first-prize specimen measured 21 inches in length and 5 inches in width, while the measurements of the second were 21 by 4½. Himalayas were good, Silver-Greys fair, and in the Variety class a beautiful White Angora won first.

We published awards last week.

Messrs. W. J. Nickols and P. H. Jones have resigned their connection with the Crystal Palace Poultry Show, the former as one of the Honorary Secretaries, and the latter as one of the Committee. These gentlemen have now undertaken to act as Honorary Secretaries of the forthcoming Show of Poultry and Pigeons at the Alexandra Palace. Mr. O. Howard continues Secretary of the Crystal Palace Show.

### THE JACOBIN.

THIS age is very generally termed one of progress, but I think it is evident that in many matters it has a downward tendency. There seems a desire all over to destroy and rebuild in a new form, and this also applies to fancy Pigeons. The Jacobin has been destroyed to a great degree, and one of the last and ugliest additions which English breeders have given this bird is the mane. The bird is named after an order of friars who wore a hood or cowl to protect their shaven heads; but there is no mention of the friars wearing a mane as well, or anything of that appearance on their dresses. Moore, to whom so many refer, does not name this appendage, which he would have been sure to do had the bird in his day possessed such. He describes the bird minutely, and tells us, among other things, that it is the smallest of all Pigeons. Is it so now, or is the true bird to be found in this realm? Not that I know of; for many years I have not seen a real Jacobin. "WILKINSON RACON" truly says "the fancy is an historical thing, not an affair of the last few years." Fortunately there are a few of us who do not intend to allow the "historical thing" to die out so long as we have our pen and our Journal conserved to us.

I saw the other day, in a work now publishing, two cuts of the head of this bird—one of the new stamp, showing the mane in grand style; the other evidently a get-up for the sake of contrast, a perfect caricature of the once elegant little Jacobin. I never saw a Pigeon answering the appearance of the latter cut. Oh, shades of Moore and Sebright! The Jacobin was a small, gentle, soft-feathered, elegant bird, exotic looking in every sense of the word. Now, the bird bearing that name in this country is a coarse, bold, strong feeder; he will fly at large, and provide for himself in the streets of a village, as I have seen. "WILKINSON RACON" has, I think, hit the mark very well, bringing to our remembrance the Mottles. The finest birds I have ever seen were light mottled, nearly white, and mottled slightly with red, flights and tail always white. Why discard them? I think the English breeders have put a cross into the Jacobin for the sake of colours to get the solid red, black, &c., and the consequence has been that the birds now are short in feather, large in girth, and coarse all over. The word "smallest" in Moore's account does not, I think, mean short, but thin. The true Jacobin is the smallest bird in girth I ever handled; in fact, while in the hand it felt like a bunch of feathers, long and tapering from the shoulders, long flights and tail, and of by no means a robust-looking habit. Small as the African Owl is, the Jacobin should not be larger in the hand. I have had this bird in hand so fine in girth that my thumb and middle finger almost met round the shoulders of the bird.

An old fancier (Mr. Hill) now long since gone, who lived in Leith, obtained from a Dutch captain a pair of Yellow Jacobins

from which he produced a large number of young birds. They were all of this type, rather large-looking on the floor, but in the hand a mere bunch of feathers. They had no mane, and for hood and chain were perfection. Such are not seen now. It is quite absurd to tell us that without the mane we cannot get the hood and chain. We had it before the mane was introduced, and we shall no doubt have it again if by no other means than importations. The Jacobin has been indigenous to other lands than ours, and from its native country we must import it before we can show the true bird bearing all its original characteristics. —J. HUIE.

### RABBIT HUTCHES.

BEFORE purchasing your stock of Rabbits it will be well to provide a place to keep them. For the common Rabbit pens partitioned-off in some outhouse or "court," either above ground or sunken, are most generally in use, but for the fancy varieties hutches are by far the most preferable; in fact, perfect success in the development of the Lop-eared variety can be attained under no other system of management.

The hackneyed saying which has appeared in nearly every work on Rabbits, that "any man can make a Rabbit hutch," is very far from true. I grant that most any man can make a box in which a Rabbit may be confined, but a box and a hutch, in my estimation, are two very different articles.

A very good substitute for a breeding hutch may be made out of a shoe box, by partitioning-off 9 or 10 inches of the small end, leaving an opening in the partition 6 inches wide, and 6 or 7 high at the back end. The front of this apartment should be tight, and hinged independent of the door of the larger apartment. This latter door should be of wire or wire netting, and hinged on top or at the side.

One of the simplest styles of plain box hutches is illustrated in the accompanying engraving (fig. 29). This is 8 feet long

Fig. 29.

16 inches high, and 20 inches wide, the corner posts projecting 2 inches below the floor of the hutch in front, and 1 inch behind, thus giving the floor a little descent, so as to carry off the water. The door A is swung from the top on a screw or pivot, and is held up by a pin or hook, D. A partition, either fast or sliding, is shown at C, shutting-off a space 10 inches wide for a breeding or nesting pen, a door, E, hung on hinges opening into it. A hole should be made in this partition about 6 inches in diameter, for the ingress or egress of the doe. It would be more satisfactory to our young friends to make the front of the large

Fig. 30.

apartment of lath or of wire (see fig. 30). The floor should project at the back from a half to three-quarters of an inch, and a space of one-quarter of an inch be left between the floor and the back of the hutch. A small tin or zinc gutter may be tacked to the under part of this projection, letting one end be a little the

lowest. All the liquid drainings of the hutch may thus be caught in a pail or basin. Three or four of these hutches may be placed one above the other, and one pail serve for all. A hutch for the buck, and also for young Rabbits after weaning, may be built the same as fig. 80, only leaving out the partition, and making the whole front of lath or wire.

Hutches built in this way are within the reach of nearly everyone, and answer as good a purpose, if kept well cleaned, as those more elaborately and expensively built. A very great improvement to the hutch shown in fig. 90 is an extra or double floor. The bottom floor should be made of tongue and grooved boards painted, or else of plain boards covered with zinc; the upper floor of lath, with the edges rounded, or of three-fourth-inch round rods, placed about one-half inch apart, and elevated 1 inch above the lower floor. This arrangement, if well covered with litter, makes a very warm as well as dry hutch. Of course these conveniences and others may be added by the fancier to any extent his purse and fancy may warrant. The ornamentation may be as elaborate as he pleases. I have heard of slate floors, polished mahogany doors with porcelain knobs, and fixtures, &c., to match, but none of these conduce to successful breeding. Just as fine Rabbits may be raised in such a hutch as we illustrate in figs. 29 or 30 as in a more expensive one. The main requisites in a hutch are cleanliness, which will keep the inmates in health, and convenience for feeding, cleaning, and examining the young. Keeping these in view, a simple hutch is as favourable to success as a more expensive one.—(*American Fanciers' Journal*.)

### LIVERTON BIRD SHOW.

AN Exhibition of Cage Birds in connection with a horticultural show was held on the 14th inst. in a marquee in a field near to the Liverton Mines. The Exhibition was a good one. The awards:—

#### CANARIES.

**BELGIANS**.—*Clear or Ticked Yellow or Buff*.—1 and 2, Baxter & Spence, Newcastle. *c. E. Winter*, Galsborough (3); W. H. Wright, Whitby.  
**NORWICH**.—*Clear Yellow*.—1, G. & J. Mackley, Norwich. 2, J. Adams, Coventry. *c. Baxter & Spence*; Moore & Wynne, Northampton. *Clear Buff*.—1 and *c. G. & J. Mackley*, 2, Moore & Wynne. *c. H. Winter*.  
**NORWICH**.—*Evenly-marked Yellow or Buff*.—1, G. & J. Mackley. 2, W. & C. Burniston, Middlesbrough. *c. G. & J. Mackley*; W. H. Wright; Moore and Wynne; T. Clemenson.  
**NORWICH**.—*Ticked and Variegated Yellow*.—1, G. & J. Mackley. 2, J. Adams. *c. W. Marlborough, Marake*. *Ticked and Variegated Buff*.—1, J. Adams. 2, G. & J. Mackley.  
**NORWICH**.—*Orsted*.—1 and *c. G. & J. Mackley*. 2, Baxter & Spence.  
**CUMWATON**.—*Yellow*.—1 and *c. Cox & Hillier*, Northampton. 2, Baxter and Spence. *Buff*.—1, J. Adams. 2, Baxter & Spence. *Marked*.—1, Baxter and Spence. 2, W. & C. Burniston. *c. J. Adams*; Messrs. G. & J. Mackley; P. Rawnsley, Bradford. 2, T. Tanniswood, Middlesbrough.  
**LIZARDS**.—*Golden-spangled*.—1, Baxter & Spence. 2, J. Adams. *Silver-spangled*.—1, W. & C. Burniston. 2, Baxter & Spence.  
**YORKSHIRE**.—*Clear Yellow*.—1, P. Rawnsley. 2, W. Agar, Castleton. *c. J. Thackrey, Bradford (3)*; J. & H. Garbutt, Great Horton; C. Worth, Skelton; J. Rowland, Skelton. *Clear Buff*.—1, R. Simpson, Whitby. 2, G. & J. Mackley. *c. W. Marlborough, Marake*; J. Calvert, Galsborough; J. & H. Garbutt; J. Rowland.  
**YORKSHIRE**.—*Evenly-marked Yellow or Buff*.—1, P. Rawnsley. 2, T. Clemenson, Darlington. *c. W. & C. Burniston*; J. & H. Garbutt (3); F. Fritschler, Hartlepool; P. Rawnsley. *Ticked or Variegated Yellow or Buff*.—1, P. Rawnsley. 2, J. Thackrey. *c. M. Jackson*, Galsborough.  
**GREEN**.—1, J. Rowland, Skelton. 2, T. Tanniswood, Middlesbrough.  
**ANY OTHER VARIETY**.—1, J. & H. Garbutt. 2, Baxter & Spence. *c. Baxter and Spence*; J. Thackrey; R. Pearson; G. & J. Mackley.

#### MULES.

**GOLDFINCH AND CANARY**.—*Buff*.—1, Baxter & Spence. 2, W. & C. Burniston. *c. G. & J. Mackley*.  
**ANY OTHER VARIETY**.—1 and *c. Baxter & Spence*. 2, W. & C. Burniston. *c. J. Rowland*.

#### BRITISH AND FOREIGN BIRDS.

**GOLDFINCH**.—1, W. & C. Burniston. 2, Baxter & Spence.  
**LINNET**.—1, R. Pearson. 2, T. Tanniswood. *c. Baxter & Spence*; W. H. Wright.  
**ANY OTHER VARIETY**.—1, J. Rowland. 2, W. & C. Burniston. *c. R. Routledge*, South Stockton; J. Fletcher, Liverton Mines.  
**FAIRBOTS**.—*Grey*.—1, J. Parritt, Lofthouse. 2, T. Henry, Liverton Mines.  
**GREEN**.—1, J. Little, Liverton Mines. 2, G. Henry, Liverton Mines.  
**ANY OTHER VARIETY OF FOREIGN BIRDS**.—1, G. & J. Mackley. 2, W. & C. Burniston.

The Silver Cup, given to the exhibitor who made the greatest number of points, was awarded to Messrs. Baxter & Spence with seventeen points, Messrs. Mackley making fourteen.

### BELGIAN CANARIES.—No. 4.

In a former chapter I drew attention to the carelessness exercised in the removal of hampers of cages during the transit from place to place. I have had cause for this complaint, for it was during the return from one of the past exhibitions held in the south of England that I lost a very good Belgian bird—a prizewinner, which met its death through a want of care. The cage the bird was in when delivered was a shapeless puzzle to behold. This is not the only instance of loss I have met with; for since the above I failed receiving back from the same place a bird and the cage it was in, the only recompense received being words to the effect that the bird and cage were not seen in the show room, although my two other cages containing birds, which were parcelled up with the lost one, put in an appearance at the exhibition. This was a still greater puzzle to me; but I have long given up all hopes of tidings respecting

either bird or cage turning up, as did my half-dozen birds and cages last year from an exhibition not one hundred miles from Brighton, after they had been knocking about in London for a week with my name and the bare address of London, instead of Derby, upon the label. I had, before sending them from Derby, properly addressed the return labels. The telegraph wires set matters somewhat right, barring the annoyance and extra expense I was otherwise put to. As I before remarked, it is better when birds "can be conveyed to an exhibition under the immediate care of the owner," Belgian birds in particular.

In my previous notes upon Belgian birds I referred to specimens upon the show stages; but before such can reach that desired position they have to pass through various phases. To my thinking there is no period during the youth of birds that Belgians appear more attractive and charming than in their nest feathers at about the age of six or seven weeks. A somewhat fascinating loveliness prevails at that particular juncture, with great promise to the enthusiastic possessor, if he can satisfy himself that true Belgian form prevails. What with the youthful freshness of plumage, the fullness of piercing bright eyes, elegantly-chiselled limbs, and aristocratic formation, backed-up with closeness of feathers possessing a soft and silky tendency, the snake-like head and neck, pipy tail, high shoulders, and a pair of wings meeting each other at the tips, all combined, claim the especial attention of one and all who make the Belgian Canary fancy their hobby-horse. And there are many who do so, and others who do otherwise and denounce them as "ugly birds." But it is the extreme ugliness to the minds of some individuals which make the birds more prizable to those who fancy them.

As the young Belgians approach a more mature stage their cleanly and smart appearance gradually becomes marred, owing to the birds beginning to undergo a change through casting-off nearly the whole of their nest feathers, and becoming more freely clothed with feathers of a richer hue. At this period (about eight weeks old) feathers strike forth as an additional covering to the underneath portions of their bodies, after which the outer body feathers bud out perceptibly. The neck and head feathers are the last to cast, and it is at this particular period that the lives of young Belgian birds are somewhat endangered if they should happen to be exposed to draughts of cooler air.

I give the following as my *modus operandi* in their more youthful stage and during the moulting sickness:—When the young Belgian birds have been parted from their parents discontinue the green food, and after they are accustomed to seed abolish the egg or soft food. Tempt them with canary seed in addition to the egg food when about a month old, and when you find the birds shelling the canary seed supply less of soft food, until you gradually and entirely wean them from it. Place each young bird when about six weeks old in a cage or partition to itself, covering each cage with some light cloth. Do not darken the cages. Colour, as with Norwich birds, is not so much to be aimed at as true Belgian position. Furnish each cage with seed and water receptacles, besides providing one for special food occasionally, such as crushed biscuit (sometimes moistened with a few drops of sherry wine), a few groats, and maw, lettuce, and cress seeds, with now and then a little stale soaked bread, which, after the water is extracted, may be otherwise further moistened with three or four drops of cod-liver oil. This occasional food will nourish the birds during sickness. A piece of suet may be placed betwixt the wires at the end of the perch. No sugar, but a small piece of salt, which tends to regulate and purify the system. Canary and millet seed may be supplied. The foregoing diet will be good during the moulting or any other time. If at any period constipation should occur, put half a teaspoonful of treacle in the water. Do not moulnt Belgian birds with cayenne pepper.

I always prided myself in bringing my Belgian birds up to the mark, and I have bred and exhibited successfully a good many in my time, treating them as I have set forth above; but in addition, a day or two prior to exhibiting them, add a little sherry to their water, besides blowing them with some. The best of sherry must be used. The "blowing" is effected by taking within the mouth half a teaspoonful of wine, and forcing the same from betwixt the compressed lips over the bird in a fine mist. This operation may be repeated two or three times. Mind and do not make the mistake by swallowing the sherry yourself. I was once instructing a would-be Belgian fancier in the art of blowing sherry over birds, but he made what appeared to me the intentional mistake of swallowing the wine, remarking, "For the life of me I cannot afford to part with it." The sherry "blowing" may be periodically practised during the moulting, after each of which occasion (the wine, if well delivered from the mouth over the legs of the birds, having a titillating effect) give your Belgian bird pupils, whilst inclined to prance about somewhat and stretching their legs, a lesson or two by "fiddling them up against the wall" with the thin magic wand now and then occasionally rubbed on the sandy floor of the cage bottom, and also gently moving it about beneath

the perch the bird is standing upon. By-the-by, let there be but one top perch in the cage, or you will habituate your Belgian bird to the hanky-panky actions the Scotch Fancy birds have of jumping from one perch to another.—Geo. J. BARNESBY.

### EGYPTIAN BEES AT HOME.

HALF a generation ago our late friend Mr. Woodbury described how he was obliged to banish the Egyptians from Devonshire in consequence of their untameable ferocity; and according to the following account, condensed from Swineforth's "Heart of Africa," they do not appear to keep "company" manners at home:—

"As our towing-rope was being drawn along through the grass on the banks it disturbed a colony of bees. In a moment like a great cloud they burst upon the men who were rowing, who all plunged into the water and sought to regain the boat. The bees followed them, and in a few seconds filled every nook and cranny of the deck. I called out to know the cause of the noise and confusion, but only got excited gestures with cries of 'Bees bees!' I tried in vain to light my pipe. In an instant thousands of bees are about me, and I was mercilessly stung all over my face and hands. Vainly I tried to protect my face with my handkerchief, and the more violent my motions the greater was the fury of the bees. The maddening pain was now in my cheek, now in my eye, now in my head. The dogs were frantic and burst out, overturning everything in their way. Losing well nigh all control, I flung myself in despair into the river. I dived, but all in vain, for the bees still rained down on my head. I crept through the reedy grass to the swampy banks, and with lacerated hands tried to gain the mainland to find shelter in the woods, but was dragged back by my servants with such force that I was nearly choked in the mud. Again on board I dragged a sheet from my chest, which afforded me some protection, while I gradually crushed the bees enclosed within the sheet. By great courage on the part of my people my large dog was brought on board and covered with cloths; a smaller one was never recovered, stung to death no doubt by the bees. Cowering down under my sheet I lingered out full three hours, whilst the buzzing continued uninterruptedly, and solitary stings penetrated periodically through the linen. Everyone became equally passive with myself—perfect silence reigned on board, and the bees gradually subsided. Some of the crew then went stealthily up the banks and fired the reeds. The smoke scared away the bees, and the boat was drawn to the other bank. With the aid of a looking-glass and pincers I extracted the stings from my face and hands, but could not reach those under my hair. These produced ulcers which for two days were very painful. I felt ready that evening for an encounter with half a score of buffaloes or a brace of lions rather than have any more to do with bees! Several of our party suffered from violent fever. Of sixteen boats which followed us all were pestered by these bees, and two persons were stung to death."

### APICULTURAL SHOW AT STRASBURG.

The Association of German and Austrian apiculturists have chosen for the place of their twentieth annual meeting the city of Strasburg in Alsace, on the 14th, 15th, 16th, and 17th September, and there will arrange in the buildings and grounds of the Orangerie, which have been placed at their disposal by the city, an International Exhibition of Apiculture, together with a prize lottery of apiculture products. The participation in the Exhibition is open to all. Living bees, as well as all articles and products relating to the culture of bees, will be received for exhibition. A jury named by the Association will award the prizes. The Association, desirous of giving every facility in their power to strangers visiting the city on this occasion, have named a special committee for the reception and lodging of guests. Mr. Louis Henry, President of this Committee, will willingly give any information that may be desired, through inquiries addressed to him at the Mairie at Strasburg. All communications should be addressed to the President of the Exhibition Committee, Dr. Raymond Schramm, Dornengasse No. 11, Strasburg in Alsace.

**MOSES QUINBY.**—This distinguished bee-keeper died at his residence at St. Johnsville, N.Y., May 27th, aged sixty-five years. Mr. Quinby was the author of "Mysteries of Bee-keeping," a work that is highly prized not only by American apiculturists, but in the library of almost every noted bee-keeper of the European world. He has for a number of years past been a valuable correspondent of the leading agricultural papers and bee journals of the United States. He served one term as President of the North American Bee-keepers' Society with credit to himself and honour to the Society. He also held the office of President of the North-eastern Bee-keepers' Society for a number of years, as also that of many other organisations pertaining to agriculture. He was extremely practical in his

advice to bee-keepers, as well as his workings in the apiary.—(Philadelphia Practical Farmer.)

### OUR LETTER BOX.

**HOUDAN CHICKEN FEATHERING (Houdan).**—It is a characteristic of Houdan chickens to feather very early, but we have seldom found their tail and wing feathers grow till they were fully twelve weeks old. The first change of plumage is not moulting; it is a substitution of feathers more fitted for the wear and tear of increasing age than the downy covering of the first few weeks of life. You will often see a young cock with his neck covered with stubs as though he were in deep moult; but it is not so, it is the gradual formation of his first adult plumage. That will last till the regular moult comes on. Moulting is the process by which every feather is dropped and replaced by a new one. It comes on as soon as the duties of the breeding season are over. The old clothing, warm enough for the hot summer, would be a poor covering in the winter. After incubation, confinement, and the care of a family, the plumage has lost beauty and utility. The work of the breeding season is done. The feathers then begin to fall, and are replaced by new ones. This is generally in June, July, and August. The process is a slow one, but sure; the feathers grow in strength and beauty. Winter finds the bird well protected, and the breeding season finds it clothed in nuptial plumage.

**CRYSTAL PALACE HONEY SHOW (Billingey).**—Mr. Hunter of Eton Rise Ealing, will be happy to give you all necessary information; also the proper price to put on your honey and honeycomb. Prices probably will be high this year in England, as honey is not plentiful.

**HYBRID LIGURIANS (G. T. S.).**—The bees you sent in your last note have the Ligurian marks, and appear to be hybrids or half Ligurians. It is a common occurrence for the queens of common bees to be mated with Ligurian drones from hives several miles distant. Many of our queens are thus mated, and we know not where the drones come from.

**CANARY WITH A LUMP ON ITS NECK (A Pet's Keeper).**—Your Canary is not suffering from a confirmed disease of any kind. The outward application of fatty matter in some instances would be good, but in the case of your pet the oil about the neck would cause the bird to feel more uneasy through the cloggy tendency it would have upon the feathers, besides closing the pores of the skin. All outward eruptions are caused by a defective state of the blood—the same in birds as other animals, therefore it is better to go to the root of the evil. In the first place we will advise you to administer one or two drops of castor oil, inwardly of course, and in the next place to alter the diet of the bird. Instead of only giving your bird canary seed, reduce the same at least one-half, by letting soaked and scalded rape seed take the place of it. Keep the bird upon a free vegetable diet also, letting it have lettuce, water-cress and groundsel. The common weed known by the name of plantain is growing in abundance just now, and supply your bird with as much of it as it will eat. The weed is known by its peculiar spired, closely-seeded stems, and grows freely on roadsides. Not having seen the bird to see what sort of a "lump" it has upon its neck, it would be dangerous to recommend a surgical operation with the knife. If the protuberance or callosity is of a hard tumorous nature you may cauterise the immediate surface of it with canthar. It may be fearful that it will be painful to the bird. It may possibly wane away. Place a little stick liquorice and a rusty nail in the water. No sugar or other sweets. Keep a small piece of salt in the cage. With the above treatment it is just possible that the "lump" may disappear over the moult. If it does let us know.

### METEOROLOGICAL OBSERVATIONS.

### REMARKS.

18th.—A very pleasant day, being much cooler; showery about 5 P.M., but fine after.  
19th.—Very fine morning; midday dull, dark, and foggy, particularly so about 5 P.M.; tremendously heavy rain about nine, and continuing on till midnight.  
20th.—A little rain in the morning, and very soon dark, but a pleasant day.  
21st.—Fine morning; rather cloudy at noon; but a very fine afternoon and evening.  
22nd.—Heavy in the morning, but soon clearing off, and followed by a very fine day.  
23rd.—A very pleasant day throughout.  
24th.—Cloudy morning, and occasionally so during the day; on the whole a very pleasant day, and splendid start night.  
A very pleasant summer week, the only remarkable feature being the unusually heavy shower on the 19th, when 0.19 inch of rain fell in one minute; the total fall in the day was 0.059 inch. The mean temperature was about 8° below that of the week previous, except underground, which was 1° in excess.  
—G. J. SYMONS.

### COVENT GARDEN MARKET.—August 25.

A LARGE quantity of all kinds of goods have been cleared during the week, with no alteration in prices. Heavy supplies of Kent Filberts, realising from 82s. 6d. to 87s. 6d. 100 lbs. Jersey Grapes 8d. to 10d. a pound, good samples of English Grapes fetching very little more.

From observations taken near London during forty-three years, the average day temperature of the week is 75.0°; and its night temperature 47.3°.

From observations taken near London during forty-three years, the average day temperature of the week is 75.0°; and its night temperature 47.3°.

WHICH IS THE BEST WAY TO TRAIN  
OUTDOOR PEACH TREES?

**D**URING the autumn of 1872 I purchased thirty maiden Peach and Nectarine trees, including the best of the old kinds and some of Mr. Rivers's newer varieties, never dreaming for a moment that the latter were such acquisitions as they have since proved themselves to be, and I should have been more than satisfied if they had only turned out half as well as they have, for we always expect everybody to think his own geese are swans. Mr. Rivers, however, seems to be free from that common failing, and to be able to judge with impartiality his own productions, and only to let us outsiders become acquainted with such as are worthy of being associated with his honoured name.

Although I wanted to test some of the varieties, my main object was to test a whim of my own for quickly covering a wall; for as a rule Peaches do not flourish at all in this neighbourhood out of doors, and indeed the trees do not live many years in the particular spot I have charge of, the soil being extremely cold and heavy, the atmosphere humid, and frost visits us every month in the year; it completed the cycle this year by coming in August, and leaving its visible effects on Heliotrope and Coleus. Under these conditions it is hardly worth while to go very elaborately into a system of training which will take eight or ten years to cover a wall, for it is a hundred chances to one if the trees ever live to such a respectable age.

Again, I always had an idea that the severe mutilation Peach trees undergo for the purpose of producing what are called trained trees has much to do with their habit of gumming in after life. If you should be so fortunate as to procure young trees evenly balanced, it is a very difficult matter to keep them so. Strong sappy shoots will occasionally start, and if not attended to immediately will rapidly rob the weaker growths; and cut, pinch, and train afterwards as you will, the balance is irretrievably lost, and probably you have gumming as well.

In fan training no three branches can have equal advantages, because of their being placed at all the different angles between upright and horizontal; and although there is no difficulty in managing the Plum and the Cherry owing to their hardier nature, yet Peaches and Apricots are very seldom satisfactorily trained in this manner out of doors. Well, then, if a system can be found which is simple and gives every shoot an equal chance, and which also hastens the maturity of the wood in autumn, and produces a crop of fruit in half the time, I think that system is to be preferred. The simple cordon does all this and much more. My soil, however, I consider too strong for simple cordons; unless the walls were much higher the trees could scarcely be kept within bounds. The double or treble cordon has nearly all the disadvantages of the fan-trained tree by giving some branches greater facilities than others. What I have

adopted I suppose must be called a compound cordon, although it is still extremely simple, and I find any boy of average intelligence can be taught by the aid of one or two lessons how to manage the trees after they are fairly established.

Maiden plants are selected in autumn as if for simple cordons, only their growth must be untouched, and it must be ripe; we want moderate-sized firm wood, not pith and water. They are planted obliquely at an angle of 45° and about 4 feet apart, measuring in a horizontal line, and have just one tack to prevent them being blown about. Nothing more is done to them beyond giving a little protection in spring and taking care of the insects till the following June, when the buds which are not wanted to produce long shoots are pinched-back to two or three leaves, not pulled off; and mind, they are still unpruned, their laterals being all left on them as they were produced the previous summer.

As soon as the young trees attain a real healthy growth, say about midsummer, such as are wanted of these same laterals are nailed-in at right angles with the stem at a distance of 9 or 10 inches apart, while those not required are cut-back, leaving if possible shoots at the bases to be kept pinched-in. The laterals laid-in at right angles with the stem are trained to fill the space between the two trees, and are treated exactly on the closely-pinched cordon principle. There may be some blanks at first, but these, if the stopping and training is attended to, will be filled up by other wood buds pushing from the main stem.

It is quite a mistake to suppose laterals on Peach trees are useless; I never cut them out if there is room for them and they are produced sufficiently early in the season to ripen, even on fan-trained trees, and on fan-trained trees indoors especially; by utilising them you can cover your space in a much shorter time. On my compound cordons, as a rule, the only buds which are removed are those which are on the side next the wall, all others are kept pinched only, unless they are likely to become too crowded. I think it very important to have the main stem especially covered with foliage, as thereby the sun's rays are not likely to act injuriously on it, and it swells very much more freely than when denuded.

As I said at the commencement, I bought thirty maiden plants in 1872, that being all my exchequer would allow at that time, and my wall being a good length would only allow the plants to be about 8 feet apart; but the following autumn—that of 1873—being encouraged by the appearance of those I already had, and having brought my ideas into practical shape and experimented to my satisfaction on the system of midsummer pruning, I procured other thirty plants, and filled up the wall so that the plants were about 4 feet apart. These last-planted trees now, owing to my understanding better what to do with them, are superior to the first lot, being about the same size and very much better clothed with foliage, and I have the satisfaction of seeing such a crop of fruit on them for quality and size as I have never had here before.

Some kinds, however, have gummed badly, and some, although in excellent health and promising well for another year, are not fruiting much now: this is the case with Salway and Barrington. The last-named has made splendid growth, not a single fault in the four plants I have, and I expect great things from it next year.

I believe Barrington to be the hardiest Peach in cultivation; it is not subject to mildew, and the fruit is of good quality. Early Beatrice seems to be early in more ways than one, two trees of it planted in 1872 and 1873 produced at least four dozen fine fruit of good flavour; the first fruit was sufficiently ripe to pull off on the 26th of July. Early Louise was about a week later, and the first Early York was plucked August 19th. I have other early kinds, but have not yet had sufficient experience with them to say much as to their doings. At present Early Beatrice seems to have the best constitution among the earliest.

Among the good old kinds Bellegarde is growing well and fruiting abundantly; and Nectarines Violette Hâtive, Hunt's Tawny, Bluge, and Murray, are all in splendid health and bearing full crops.

The wall is 12 feet high, and is covered to an average of 8 feet; some kinds, as Downton and Violette Hâtive Nectarines, Stirling Castle and Bellegarde Peaches, have nearly filled their allotted spaces. The bottom of the wall is covered to within an average of 18 inches. I do not find any shoots taking the lead, for the growth is very regular when trained on this system. My present intention is to plant another length of wall in the same way during the coming November, and I hope to have it in full bearing in 1877, by which time the one I have now will probably be past its best and ready for renewal. The border will merely require trenching, and a little fresh rather poor soil placed round the roots of the plants to start them; road edgings are capital for this purpose.

It is quite a mistake to plant the Peach tree in rich soil, it makes more solid growth and ripens earlier in soil that is rather poor and sweet. A stimulant if necessary can always be applied during winter or early spring, but never after the fruit has commenced its second swelling, or the trees will be induced to make late growth.

Drainage is of the first necessity on cold soils, not merely a pipe-drain or two, but a good layer of broken bricks or stones 8 inches or a foot deep, not so much for the purpose of carrying off the water as for giving warmth to the border.

If for advocating the foregoing system of training I am accused of deserting a former text—that a tree should be trained in the way its natural habit suggests—I have only to say that the habit of the Peach tree here is to make long sappy growths which our summers cannot ripen, and thereby suggest the desirability of limiting them to such growth as can be matured.

I have temporary wooden coping-boards about 18 inches wide; these are placed in position in spring and remain till summer weather sets in; but as nothing of the sort has ever reached this part of Wiltshire this season, the boards are there still, and there they will remain till the growth of the trees is fairly ripened.—WILLIAM TAYLOR.

### CULTURE OF THE CYTISUS.

The culture of the Cytisus is not so generally known amongst gardeners as it ought to be, for if it was known to be so easily grown it would be one of their most popular plants. Many a gardener as he walks through Covent Garden is struck with amazement to see such large and well-bloomed plants in such comparatively small pots. I offer a few cultural remarks on this valuable plant.

The present time is the best to put in the cuttings, which should be of the side shoots, about 2 inches long, of moderately firm wood, not too hard or too soft, which the plants abound with at this season of the year. They will strike just as well without a heel as with, but it would be safer for beginners to take them off with a heel. They should be put in well-drained pots in a mixture of loam, peat, and sand, with about half an inch of sand on the surface, and have a gentle watering, and then placed in a close cold frame. By keeping them carefully watered they will shortly callus, and then if the pots can be placed in gentle bottom heat the cuttings will be well rooted in a month. At this stage they should have their points taken out, and when they have broken pot them off into middle 60's in two parts turfy loam and one

of peat. Keep them rather close till they begin to grow, when they should have plenty of air and light.

Keep them plunged in ashes in a cold frame till the latter end of March, when they should be potted into 48's in two parts turfy loam, one of peat, and one of cow dung well rotted. Keep them in the cold frame till the middle of May, when they should be plunged in ashes in the open air in an exposed situation where they can receive abundance of sun. Being grown in such small pots it is important that the plunging, also regular watering, be attended to. Keep the shoots closely stopped till the beginning of August, when the pinching should be discontinued. Let the plants remain in the open air till there is danger of frost. When the pots are filled with roots the plants will be greatly benefited by some weak liquid manure twice a-week till they are placed in their winter quarters, which should be in cold frames or a greenhouse, where they will soon set their flower buds, and by placing a few of the forwardest in an intermediate temperature a succession of bloom can be provided from the beginning of March till the latter end of May.

The most useful species are *C. racemosus* and *C. atleanus*. *C. atleanus* by its compact habit does not require so much stopping as *C. racemosus*.

Few plants in the spring months are so bright and effective as these; they are dense masses of gold when grown as above described. Generally they are seen of loose straggling habit by too tender nursing and insufficient stopping of the shoots in summer. By proper culture (and it is exceedingly simple) the plants when in bloom at eighteen months from inserting the cuttings are 18 inches high and through, the yellow tresses hanging over and almost hiding the pots. It is only in Covent Garden and in a few places round London that such perfect plants are seen, but they may be as easily produced in country gardens if the above details are carried out. I have omitted to say that the pots must be frequently twisted round in the summer to prevent the roots penetrating the ashes; to further prevent this each pot should be placed on a piece of broken slate.—A. Y.

### IN THE WEST COUNTRY.—No. 3.

No three places could be more distinct than those which on the day before the Exeter Rose Show I was enabled to visit through the kindness of my friend Mr. Baker, who lent me his ponies for the purpose. In Wanslade one has a good specimen of what is called in gardening parlance a dressed place. Poltimore is a good specimen of the old-fashioned style of gardening—not that I mean by that anything backward or out of place; while Killerton derives its main interest from the beauty of its position and the fine trees with which the park abounds; and as each in its way is characteristic of the horticultural taste that so widely prevails in our land of gardening, a few notes on what I saw may not be unacceptable to the readers of our Journal.

WIMBORNE, the seat of Joshua Dixon, Esq., is only a few miles from Exeter, and the house itself is a plain substantial building surrounded by admirably kept grounds. There is a conservatory attached to the house, very handsomely built with a dome-shaped roof, and the domes of each end were furnished with fine plants of *Tasmania Van-Volxemi* and *Tasmania exoniensis*, a garden hybrid, both of which were in fine flower, and their exquisitely beautiful pendant flowers were very attractive. Some fine specimens of *Dicksonia* and *Oyathes* filled, with other plants, the centre of the house; while to the side walls, which are in such buildings generally bare, were affixed baskets filled with moss in which Ferns of various kinds were planted, such as *Adiantum*, *Davallia*, and *Pteris*. The effect was very good, and I thought worthy of imitation. There is in front of the mansion a very handsome terrace garden, the upper terrace depending mainly for its beauty on foliage plants, such as *Alternantheras*, *Pyrethrums*, and *Colours*. The lower terrace is lined by a row of Golden Yew, and the beds were well filled with the usual bedding plants. *Verbena* was largely used and was very attractive. There was near this garden a very fine specimen of *Pinus insignis* 50 feet high, and a large Cedar which had been transplanted by Mr. Barron of Chiswick, and was a living witness to his skill and experience. There was a bed of herbaceous *Paeonies* which must have been very fine when in bloom, and in the shrub-beds were some specimens of *Viburnum* with noble trusses of white bloom. What, however, was to my mind the most characteristic feature of the place was a broad walk, into which

you turned from the terrace and by which you approached the kitchen garden. In front of this ran a canal, and a handsome stone balustrade was continued the whole length of the walk. On the left-hand side was a wide border, at the back of which was the wall, but this had been most judiciously hid by a line of Thujas, Irish Yews, Laurus, Colehiums, &c. In front of this was a belt of Rhododendrons, then a row of Kalmias, and the front of the border was filled with Phlox Drummondii and Larkspur. The kitchen garden was well stocked, and in the houses were some pot Vines exceedingly well done, and which had been fruited three years in succession. The croquet ground (although, alas! croquet is becoming unfashionable) was circular, and surrounded by a thick belt of Rhododendrons. The place was in excellent order.

At POLZIMORE I was kindly received by Mr. Lang, who has lived as gardener there many years, and who conducted me over the place. It is, as I have said, no way remarkable, but all about it bore witness to the intelligent care of one who evidently loved his calling. The Conifers seemed, as were all in this part of the world, in good condition. There is also, which is not unusual in Devonshire, a very fine avenue of Limes leading up to the house, which the bees much delight in. Visitors to Torquay will remember the very fine one existing there, and Mr. Lang told me that there was an idea that they were planted as a compliment to William III., the Linden being the favourite Tontonic tree. There were also some magnificent beds of Rhododendrons, and in the pleasure ground a very pretty circular roserie planted with all the best Roses. The kitchen garden contained some good houses of fruit, Peaches and Grapes being well done; and as the soil of the garden is a favourable one, vegetables of all kinds were in luxuriant growth, while there were some of the best pyramid Pear trees that I have seen for some time and well laden with fruit. In fact the whole place, while containing nothing very remarkable, was yet just what an intelligent gardener would make it; and this is no slight praise, for just as it is said the test of a gentleman being well dressed is that you would not notice anything in particular, so in a well-cared-for garden all is well done, and yet nothing may come out very prominently.

KILLERTON, the seat of Sir Thomas D. Acland, differs from the other two places, and has an advantage over them in the beauty of its position and the scenery surrounding it. The house, a plain one, stands at the foot of a hill, with a pleasant park stretching in front of it, the kitchen garden being at some distance from the house. Owing to the peculiar condition in which the property has been the glass has become old and out of repair. Indeed for some years, I believe, the garden was farmed by the gardener, and it is well known how very successful Mr. Garland has been in vegetable culture. Here again a favourable soil helped him much. He is also a bee-keeper, and I saw here some of the best-filled supers that I have seen in this sadly indifferent year for bee-keepers. But the feature of Killerton is the Deodar valley, and in the course of a few years it will be an unique sight. The valley is perhaps a little more than a quarter of a mile in length, and nearly the same in width. The Deodars are judiciously planted amongst the others which occupy the glen, and as they increase in growth spaces are cleared away for them. Already they make a remarkable feature in the landscape, and it was a happy thought to place them there. The beautiful little chapel in the grounds with its avenue of Deodars leading to it is also a noteworthy object, and the whole place is one of those charming residences for which our island is so famous.—D., Deal.

#### DESTRUCTION OF ANTS.

In our Journal of August 19th "BETA" says he has often smiled at the advice given in answer to the question, How to destroy ants?—viz., sugar in a sponge, oil in a saucer; and now I am going to add another means of destruction which I have found perfectly successful on my lawn. One remedy is useful in one case, another in another. For instance, the other day a neighbour asked me how to get rid of ants that infested his kitchen cupboard. Here neither the slate nor the flower pot would be likely to answer, but syrup of sugar or oil in a saucer could easily be used. Again, on my lawn close to the windows a slate or a flower pot would be unsightly, even if my numerous "olive branches" would leave slate and flower pot unmolested. But my remedy is free from all these objections, and is simple and easily applied. It is simply liquid manure from the stable. If the first application does not entirely do away with them a second application will complete the cure.

I have no doubt but liquid manure of other kinds will equally answer the purpose.

I can corroborate "BETA's" experience with the slate, for the other day, on lifting a flat stone in the garden, I found a strong colony beneath it, but after being disturbed they ske-daddled: so do not lift till you are ready to destroy. Another plan, but which I have not tried, is to put an empty flower pot over their nest upside down. They will build up into this, and it can be taken up with a shovel and handed over to the chickens or young pheasants, or be otherwise disposed of.—H. C. BIPLEY.

#### THE PHLOX AND PENTSTEMON AT LEA BRIDGE ROAD NURSERY.

I HAVE frequently had occasion to recommend the Phlox as a very valuable easily-cultivated plant for autumn flowering. My reason for doing so has been founded on the fact that, although it is a fit subject for a royal garden, it may be grown quite as well and to as high a state of perfection by the most humble cottager.

Its management may be summarised in a very few sentences. First as to propagation. In spring when the young growths are about 2 inches in length, which they will generally be in March, they may be taken off and inserted one in the centre of a thumb-pot. The pots should then be plunged in a little bottom heat in a hotbed; the cuttings will soon strike roots, and when a little growth has been made the plants should be potted into 5-inch pots. The compost most suitable is four parts turfy loam, one leaf mould, and one of rotted manure. A little sand should be added if the loam is not naturally sandy. The plants should be grown in a sheltered position out of doors, and be removed to the greenhouse when the flowers begin to open. When the flowering period is over the plants may then be cut-over and plunged out of doors, or else planted-out at once, for these are the plants that will make a splendid display out of doors the following season. Some of the plants will throw-up a large number of spikes, others only two or three. The last number will be enough to allow on each plant, and if the ground is deeply trenched and well enriched with rotted manure the plants will be certain to give satisfaction. When the stalks are cut-down in the autumn the ground between them should be mulched with frame dung that has been well decayed, when a good growth may be expected the following season; but cuttings should be taken from the plants in the spring, as after the third year the old plants should be dug-up and destroyed. The Phlox needs but little attention; the spikes merely require fastening to a stoutish stick, as they very easily snap-over at the surface of the ground.

I was induced to make the above remarks after visiting the nurseries of Mr. John Fraser, Lea Bridge Road, where hundreds of plants comprising all the best of the old and also the newest sorts may be seen planted-out in beds. Mr. Fraser was good enough to go round with me, and together we selected the following as the very best in the collection:—Riviere, bright salmon, purplish crimson eye; Mme. Joubert, purplish salmon, carmine eye; Madame Meuret, rosy lilac, crimson eye; Josephine Towest, bluish shaded, crimson centre; Deliverance, mauve, crimson eye; Esperance, deep rose, crimson centre, each segment of the petals marked with white; Mons. Thibaut, salmon, purplish centre; White Lady, fine bluish white; Chanzy, bright rosy purple, small crimson eye; Menotti, lilac, large white centre; Rose d'Amour, very bright crimson salmon, darker centre; Coccoinea, bright crimson scarlet, very fine variety; Mlle. Hermine de Turenne, crimson, darker centre, splendid spike; Madame Marin Saison, white, large purple centre; Madame Randatler, striped lilac, large flower; Etoile de Neuilly, white, large crimson centre; Madame la Comtesse de Turenne, white, very fine rose centre, grand spike; Souloque, bluish, large purple centre, large flowers; Virge Marie, white, purple eye, fine spike; Mrs. Mitchell, white; Mrs. Hunter, bluish, crimson eye, fine flower. With the exception of the two last-named sorts, all the others belong to the decussata or late-flowering section, which succeeds best in the south of England. The early-flowering section succeeds best in the north.

Pentstemons are another class of autumn-flowering plants requiring similar treatment to the Phlox, except that the cuttings are taken from the plants in autumn, and the pots are wintered in cold frames, and when growth begins in the spring the plants are potted-off, and they are planted in beds in

March or April. It is best to propagate a fresh stock every year. There is a great variety amongst them, but I only noted a few of the best and most distinct flowers:—De Candolle, purple, white throat; De Saussure, bright red, white throat; Grand St. Bernard, bright purple, white throat; Grand Patriot, purplish crimson, white throat, beautifully pencilled with purple; Drapeau Nationale, bright red, white throat, pencilled red; Union, rose, white throat, pencilled purple; Concord, reddish purple, the throat of the same colour, dark pencillings; Michel Buchner, splendid flower with crimson purple throat, beautifully pencilled; W. E. Gumbleton, large flowers, light purple, white throat; Stanstead Rival, scarlet, white throat; Valerie, crimson, white throat.

In conclusion, it may be stated that the Pentstemon is better adapted than the Phlox for cutting to fill large vases or other decorative purposes, as the plants last longer in beauty; the Phlox fades very soon after the spikes are cut, so that the peculiar beauty of the flower is best admired on the growing plant.—J. DOUGLAS.

## STRUCTURES FOR FORCING AND PROTECTION.

### No. 1.

THE inquiries of many correspondents will be answered, and those of others anticipated, by the submitting of a few of the various means which are adopted for the protection of plants against the inclemency of the weather. The means submitted are those which have proved their utility by actual practice, and are adapted for different plants and circumstances.

As it occasionally, or it might be said commonly, happens that what is required is not an expensive and elegant construction, but something plain, inexpensive, and effectual—it may even be of rude material, and of primitive appearance, such that may occupy a place in the back kitchen, the frame ground of the garden, that we first draw attention to the simplest of all protective aids, by going literally to the root of the matter—i.e., the earth.

These earth pits were found of great value by the late Mr. R. Fish.

Fig. 31 is a simple excavation where the earth is banked

Fig. 31.

highest at the north side, affording a sharp slope to the covering to carry off the rain.

Fig. 32 is of the same nature but with sloped sides. The em-

Fig. 32.

bankments if surfaced with asphalt will exclude the wet, and the pit will last for many years.

Fig. 33 is a turf pit above the ground level, and dryness is consequently better secured.

Fig. 33.

The pits may be 5 feet wide and of any convenient depth, say 2½ feet at the back and 15 inches in front. The pits, especially those having vertical sides, should have upright posts driven in at intervals, and be lined with rough boards with cross pieces wedged in to keep the sides from pressing inwards. They may be covered with glass, shutters, straw hurdles, or tarpaulin to exclude wet or frost, of which neither will find

entrance except by the top. Such pits are useful for wintering Endive, Lettuces, Cauliflowers, Calceolarias, and Gazania cuttings, Lobelias, Pentstemons, Pansies, &c., indeed, all plants which are not really tender, but which still require a measure of protection. They are admirable for Tea and choice and tender Roses, also for plunging in them hardy Azaleas, Rhododendrons, Deutzias, &c., which require protection at the root, which saves both pots and plants. In the spring they are capital aids to an early crop of Potatoes, also for Tomatoes, Vegetable Marrows, and Cucumbers in summer. They are always ready for seed-sowing, cutting-striking, and plant-nursing; indeed they are rough and ready aids to any gardener.

A more perfected earth pit is devised by Mr. Abbey. It is thoroughly substantial, neat, and undoubtedly useful.

For this pit a dry site should be selected, and it should be well drained. The walls are built hollow on a broad foundation of asphalt. A well-made frame or sill with lights (double glazed) are affixed, the whole to be finished in a workmanlike manner, and spouted to carry off the water. This is unquestionably a first-rate and invaluable earth-bound structure, of which Mr. Abbey says—“We have in this pit a winter mean temperature of 58°, or we have that temperature in the earth, and may have it in the pit providing sufficient covering be given to retain it. Though sunk in the ground the pit will be fairly dry, for the walls &c. will keep damp from

Fig. 34.

the inner walls &c., and damp cannot rise up them on account of the lower courses being laid in asphalt. Any water accumulating in the area or cavity &c. will descend to the bottom, and pass, as regards the back, into the drainage through the pigeon-holes, whilst the front will take the water from the drainage, and that in the front cavity should communicate with a drain. Any damp rising in the cavities is to be dissipated by removing the wood plugs that close the pipes &c., which will cause a change of air in the pit at any time, and that may be effected without opening the lights in dull damp weather when the heat of the pit is deficient. Much may be done in the way of securing more heat by keeping the lights closed in sunny days and ventilating through the pipes &c.; and another use of the pipe ventilators is, when the external air is warmer than 58° they may be opened for a few hours in the middle of the day, and a change of air thus given the plants as well as the temperature increased, and this without removing the covering. The pipes all have wood plugs, kept close when the atmosphere is below 58°, and open when above that temperature, day and night. Without protection 10° of frost will be kept out when not of longer continuance than an evening or a night, and with a 9-inch covering of dry straw or litter of any kind, which must extend over the pit as far as the pipes &c., the pit is proof against any frost occurring in our climate; but a 6-inch covering will in most cases be sufficient.”

The next, which is a cheaply-erected, substantial, and very useful protector, is built above the ground level.

Fig. 35.

This pit, both for protecting plants in winter and growing them in summer, is an important adjunct to any garden. The ground should be sloped up the front wall and tarred to carry off the wet.

The next is a sunken pit and adapted for the protection of tall

plants. The walls of these pits are represented as of 9 inch solid brickwork, but it would be infinitely preferable that they be 14-inch hollow walls, which would more than double their frost-resisting power. The glass if sufficiently covered with mats and straw will render these hollow-walled pits frostproof

Fig. 82.

in any ordinary winter. However, a pipe or smoke flue along the front of Fig. 83 is strongly recommended.

frames attached to communicate heat to the frames and house at the same time. A dry site is necessary, and the plan is carried out by sinking the walls 5 feet below and raising them 6 feet above the ground level. The house can be made of any requisite width and length.

Fig. 83.

In most of the plans submitted the earth is mainly relied on and turned to account as a protective medium. This is supplemented by coverings; and the introduction of a pipe, flue, or stove, as is the most convenient, will prevent the temperature falling so low as to injure plants which without protection

Fig. 86.

Another earth pit still further advanced has been communicated by a journeyman gardener. It is heated by hot water, and is a neat and admirable contrivance, not only for protecting but for cultivating plants. A lattice-work platform could be substituted for the soil if required.

Fig. 87, *a a*, is the ground level; *b*, a line of pillars, on the tops of which is laid a strong beam for the support of the planks on which rests the soil of the bed; *c c*, hot-air chamber, with flow and return hot-water pipes; *d d*, pipe in connection with the hot-air chamber for the regulation of atmospheric heat; *e e*, a connection between the pipes *d* and the eva-

Fig. 87.

porating pans on the hot-water pipes, by which means water can be poured into the pans, and moisture admitted to the atmosphere at pleasure.

Fig. 88 shows the sashes of this pit and the mode of fixing and ventilating.

This pit besides its usefulness for plants is adaptable for forcing vegetables, as French Beans, Asparagus, Radishes, Potatoes, Sea-kale, Rhubarb, &c.

Another idea (fig. 89) is submitted. It was originated by Mr. Geyelin, C.E. It is a house for wintering plants with hothead

would be destroyed. These plans will be suggestive, and may be followed by others more pretentious in character yet of practical value for many gardens.—*COMPIER.*

#### OUR BORDER FLOWERS—MILKWORTS.

WHEN the earth has put on her mantle of living green it is truly said that flowers are blooming everywhere. Turn our eyes where we will they meet our gaze at every step, and our senses are regaled with their sweet perfume. While strolling along the woodland bank, by the rippling stream, the cheerful mead, the browed heath, or the verdant lawn, the wandering eye is often caught and charmed by that little inhabitant of those scenes, *Polygala vulgaris*, with its lovely blue flowers; and have we not paused and said to ourselves, What can it be? Perhaps we have torn it from its bed to secure a plant for cultivation or to store-up in our herbarium.

Various shades of colour are met with in this little group of plants from dark blue, rosy purple, pink, to white, yet they are *Polygala vulgaris* still. They may be brought into cultivation and afford pleasure to the cultivator on the rock or in the border. They will grow well in sandy loam, peat, and leaf mould mixed in the ordinary soil of the border. They are met with on the dry bank as well as in the moist meadow, and where we find them they look at home. They may be increased by division after flowering. When well established the less they are disturbed the better. *Polygala paucifolia*, said to be from America, is of very dwarf habit, and requires sandy peat and loam; it should have a favourable place on the rockery or among the alpine in pots. *Polygala alpestris* is only to be met with in choice collections; it should have a sunny situation on the rockery, and be attended to with water when required. *Polygala major* is of rather stronger habit;

it may have a place on the rockery or border planted in the compost named above.

*Polygala chamaebuxus* is the largest of the race, and of half-shrubby habit. Its leaves have a Box-like appearance, and the plant is of prostrate growth. It is said to have been introduced into this country more than two hundred years ago. It might be asked, Where has it been since? for seldom is it seen except in some nursery as a store plant. It is an early spring-blooming plant with two shades of yellow pea-like flowers, and what adds to its charms is that it affords us a most delicious perfume. It is increased by cuttings and divisions. It is invaluable for the spring garden, rockery, or border, and only needs to be known to be appreciated.—*Vermes*.

## ROYAL HORTICULTURAL SOCIETY.

SEPTEMBER 1ST.

THIS Exhibition is designated the Dahlias Show, but Dahlias constituted a very small portion of the display, and the blooms generally were small. The plants as a rule are backward this year owing to the wet and odd month of July, and on this account many notably good growers cannot exhibit in their usual style of excellence. By far the most attractive classes were the Gladioli. Of this, the finest of autumn flowers, splendid spikes were staged. Asters were also exceedingly fine. The Exhibition was not large, and did not show to advantage in the lengthy corridor, whereas in a smaller place, as for instance the Council-room, the effect would have been quite imposing.

In the open class for thirty-six Dahlias, distinct, Mr. J. Keynes, Salisbury, was the only exhibitor. His collection comprised beautiful, symmetrical, but on the whole not large blooms. Some of the best were Prince Arthur, Edward Purchase, William Keynes, Henry Walton, Juno, Flora Wyatt, Julia Davis, and two very fine seedlings. In the nurseryman's class for twenty-four blooms Mr. Keynes was again without an opponent. In this stand Pauline, James Cocker, Hugh Miller, Arbitrator, Queen's Messenger, John Standish, Annie Neville, and Henry Glasscock were very perfect.

In the amateurs' class for twelve blooms were five competitors, the most perfect stand coming from H. Glasscock, Esq., Bishop's Stortford. The blooms were not large, but their finish and refinement was very noticeable. They consisted of James Cocker, Miss Henshaw, Willie Eokford, Vice-President, John Standish, Acme of Perfection, Lady G. Herbert, Cremorne, Her Majesty, J. N. Keynes, Mrs. Harris, and James Service. The next best blooms in this class came from Mr. G. Smith, Edmonton. They were small but of perfect form, especially Charles Backhouse, Edward Purchase, and Willie Eokford. Larger blooms were staged by Mr. Anstiss, Brill, Bucks, and some of them were very perfect, especially Flora Wyatt, John Standish, and Edward Creed. Mr. Griffiths, Wood Green, was placed third with smaller blooms. In the open class for twelve Fancy Dahlias Mr. Keynes was the only exhibitor. The most attractive blooms were Flora Wyatt, Fanny Stark, Pauline, Parrot, Mrs. Saunders, and Egyptian Prince. In the corresponding class for amateurs, six blooms, Mr. Glasscock had charming blooms of Flora Wyatt, Louis Haslam, Grand Sultan, Viceroy, Pauline, and Mrs. Saunders; by Mr. Anstiss following. His best blooms were Rev. J. B. M. Camm, Egyptian Prince, and Mrs. Saunders.

**GLADIOLI.**—In the open class for twenty-four varieties some magnificent spikes were staged, as may be expected when such a grower as Mr. Kelway is beaten, as he was on this occasion by Messrs. Robertson & Galloway, Glasgow. This was a noble collection:—Monsieur Legouvé, Ondine, Hercules, Orpheus, Paotole, Psyche, Warrior, Adolphe Brogniart, Sylvia, John Waterer, Seda, Madame Desportes, and Amalthée were the best varieties. Messrs. Kelway had the second place, noticeable being Felix, Shakespeare, Osci, Scarpis, Mrs. Reynolds Hole, Hermannii, Palamedes, and Xerxes. The varieties named comprise some of the finest in cultivation. Mr. Douglas also had a collection which embraced some good spikes and bright-coloured flowers, and took the third prize.

In the open class for twelve varieties, Rev. H. H. Donbrain was first with grand spikes, every one of them good. Meyerbeer was especially imposing by its long symmetrical spike, and *Le Vase* by the brilliancy and texture of its flowers. Triumphant, Princess Mary of Cambridge, and Talisman were also very fine. Mr. Douglas, Loxford Hall, had the second place with mostly his own seedlings, but we fancied that this able cultivator was scarcely equal to himself on this occasion. In the amateurs' class for six spikes Rev. H. H. Donbrain was again in the ascendant, and Mr. Douglas was very close at his heels. A seedling, bright mauve and white, in Mr. Douglas's collection was very striking. The third prize went to Mr. Harding, gardener to Mrs. Benham, Syon Lodge, Isleworth.

ASTERS were very fine indeed, but, as pointed out by the Hon. and Rev. J. T. Boscowen, the ornamental and serrated paper in which some of the blooms were set detracted from the beauty

of the flowers, which undoubtedly showed to advantage on plain circular bases. For twenty-four French Asters in twelve varieties (open), Mr. Wheeler, Warminster, had the first place with some of the finest blooms which have ever been staged; Mr. Stickler, gardener to — May, Esq., Reigate, being second; and Mr. Morgan, gardener to Major Scott, Wray Park, third. And for Quilled or German Asters Mr. Wheeler was again in the first place; Mr. Benham, Baginbun, Newbury, being second. Mr. Morgan also exhibited, and Mr. Turner sent a collection of remarkably compact and distinct blooms of great merit.

For twelve pots of Asters (open), Mr. Dean, Ealing, was the only exhibitor, with massive pots of Victoria.

Messrs. Sutton & Sons, Reading, offered prizes of silver and bronze medals for collections of twenty-four Asters in twelve varieties, which were won by Mr. Morgan and Mr. T. Benham respectively. The blooms were very fine, and creditable alike to seedsmen and growers.

**HOLLYHOCS.**—In the nurserymen's class for twelve cut blooms Mr. Wheeler, Warminster, was the only exhibitor with fair blooms, which, however, had received injury from the weather or in transit. In the class for twelve double Zinnias Mr. Wheeler had the first place with very good and distinctly-coloured blooms, the second prize going to Mr. Morgan, gardener to Major Scott, the bright colours in this stand being particularly dazzling. For six Lilliums in pots Mr. Turner, Slough, was the only exhibitor. He had six pots of *L. auratum* averaging twelve blooms each, several of which measured 12 to 15 inches in diameter, and were very fine.

Mr. B. S. Williams exhibited an attractive collection of miscellaneous plants, amongst which *Odontoglossum Reezii* and *Casteya gigas* were noticeable amongst the Orchids; *Berkeleya*, Ferns, and Palms were exhibited in small but healthy plants, and conspicuous was half a dozen gigantic Cockscombs measuring 30 inches each from tip to tip. Mr. Aldous also staged a group of well-grown decorative plants. Extra prizes were awarded.

**FAIRY.**—In these classes there was a nice but not a large display, and in regard to the Apples some mistakes were apparent.

For nine fruits of Irish Peach Apple the premier award went to Mr. B. Dean, Ealing, for a dish bearing a greater resemblance to Red Astrachan than Irish Peach. For the same number of Early Julien, Mr. Harding, Syon Lodge, Isleworth, had the first prize for a conical-shaped Apple, which if Early Julien at all is of an abnormal shape; a dish of what appeared to be the true Early Julien by its side being passed by unnoticed. For six fruits of Lord Suffolk, Mr. Brush, gardener to Lady Home Campbell, The Grove, Pinner, was placed first, and Mr. Dean second, for very good fruit. In the class for nine fruits of any kind of dessert Apple the first award went to Mr. Benham for Red Astrachan, Mr. Douglas being second with Kerry Pippin. This is an instance of quality succumbing to colour, of intrinsic table merit to outward show.

For six fruit of Souvenir du Congrès Pear Mr. Douglas had the premier award for a very fine dish. For six fruits of Madame Treve Mr. Wheeler, Warminster, and Mr. Douglas were placed first and second respectively; and for the best dish of any other dessert Pear Mr. Douglas won with a splendid dish of Williams's Bon Chrétien; Mr. Gardiner, gardener to E. P. Shirley, Esq., Lower Kington Park, being second with smaller specimens of the same kind.

**PLUMS.**—For six varieties of nine fruits each the first award went to Mr. Bridgeman, gardener to J. S. Cook, Esq., Great Marlborough, for Kirke's, Green Gage, Jefferson, Washington, Reine Claude Violette, and Diamond. Mr. Burnett, gardener to Mrs. Hope, Deepdene, being second with Dennistone's Superb and Victoria in addition to those above named; the third award going to Mr. Record, Vinters Park, Maidstone. These collections were very good, the third being nearly equal to the first, and quite so to the second. The class for three varieties Mr. Bridgeman had the first place with Kirke's, Jefferson's, and Washington; Mr. Burnett being again placed second, and Mr. Record third.

For the best single dish of Peaches the award went to Mr. Dean, Ealing, for fine fruit of Grosse Mignonne; and for the best dish of Nectarines Mr. Douglas won with a handsome dish of Pine Apple. An extra prize was awarded to Mr. Dean for Moorpark Apricots.

**FRUIT COMMITTEE.**—Henry Webb, Esq., in the chair. Two sorts of autumn-bearing Raspberries—viz., Surpasse Merveille, Saisons Blanc and Saisons Rouge were sent from the Society's gardens. The autumn fruit of Raspberries is generally wanting in flavour.

Melon Duke of Connaught was sent by Mr. C. Osman of the Metropolitan District Schools, Sutton; it was not in good condition. A hybrid Melon was also sent by Mr. G. Anderson, The Gardens, Slopes Wallacey, but the flavour was very bad.

Seedling Damsons No. 1 and 2 were sent by Mr. W. Hoxley, Teddington, Beds, but they are not materially different from the ordinary Damson.

The Rev. A. Rawson, The Vicarage, Bromley Common, sent

branches of Siberian Crab and Denyer's Victoria Plum, loaded with fruit, to show their free-bearing character.

A. Smee, Esq., Finsbury Circus, sent fruit of Banani Apple, an excellent early sort, very distinct in appearance. A new early seedling Apple was sent by Mr. T. Thirkel, seedman, Wisbech. The fruit was very highly coloured, conical-shaped, but deficient in flavour.

Mr. Dancer of Chislewick sent a dish of the Sultan Plum from a standard tree. It is an excellent kitchen Plum.

A white-spined Cucumber was sent by Messrs. Kelway & Co., Langport. From the accompanying photographs it is evidently a very free-bearing sort; but it was not thought superior to other white-spined sorts.

Mr. B. Dean of Ealing sent specimens of Cobbett's Maize and the new Japanese Radish reported upon at the last Meeting. Excellent specimens of Lord Suffield Apple and Black Diamond Plums were sent by Mr. T. Smith of Iwer. Mr. Voice of Horley sent an improved Cucumber frame, very light in appearance, and seems exceedingly well adapted for growing the fruit. The frame 6 feet by 4 had twenty fine specimens, some of them 20 inches long. Mr. G. Sage of Ashridge Gardens sent a collection of eight sorts of Filberts and Cob nuts; the branches were loaded with fine fruit. A vote of thanks was given for them. Mr. W. Paul of Waltham Cross sent a collection of fifteen sorts of Apples, seven sorts of Pears, and five sorts of Plums, in very good condition.

**FLORAL COMMITTEE.**—Mr. B. S. Williams in the chair. First-class certificates were awarded to Mr. J. Croucher for *Begonia metallica*, a bulbous-rooted variety with lustrous foliage and a pink flower; also for *Fourcroya variegata*. To Mr. Rawlings for *Dahlia*s J. C. Quennell, orange, and John Bennett, yellow and vermilion. Also to Mr. C. Turner, Slough, for *Dahlia* Triumph, a perfect miniature bloom of maroon-scarlet colour; and for Rose Rev. J. B. M. Camm, the queen of sweet Roses, which should find its way into every garden. To Mr. Keynes for *Dahlia*s Lord of the Isles, a splendid yellow of fine shape; *Magpie Fairbairn*, rosy lilac, of fine form; Charles Leicester, a rich maroon red, of great quality; and John Downie, a purple maroon, a large full flower; and to Mr. Bekford, for *Verbena* Ann Spiers, bluish, with a pink eye, large truss and pip. Second-class certificates were awarded to Mr. Bull for *Pescatorea Dayana splendens*; to Mr. Turner for *Dahlia* Yellow Globe; and to Mr. Keynes for *Dahlia* Dr. Livingston, rosy lilac and yellow.

Mr. Williams exhibited a collection of plants consisting of *Orchids*, *Dracontias*, &c. Mr. Harris and Mr. Turner staged *Dahlia*s; and Mr. King, gardener to Col. Holder, Binfield, Berks, sent a Silver-variegated *Pelargonium* Marion Harper, very free. Out specimens of *Aristolochia gigas* came from Mr. Smee, Finsbury Circus; *Crimums* from Mr. Williams, Fortis Green, Finchley; and from Mr. Green Streptocarpus Greenii, a distinct greenhouse plant previously noticed. From Messrs. Osborn & Sons, Fulham, *Pyrethrum leucostemum aureum*, var. Out specimens of *Clematis* from Mr. Noble, Bagshot, Gladioli from Messrs. J. Kelway & Son, and *Phlox Drummondii* from Mr. Dean.

### THE YUCCA, GOOD SPECIMENS.

I THINK it will be admitted that few plants give a more tropical aspect to outdoor vegetation than the Yucca, more especially where it is met with in a thriving condition and its surroundings are of a becoming kind. But it is not one of the class of plants that admits of being shifted about from place to place, nor will it submit to the ever-changing character that fashionable flower gardening has now-a-days subjected so many of its tenants. Although when grown in a pot it can be moved at pleasure, but when planted out it ought to be allowed to remain several years in the position chosen for it, taking care that no encroaching neighbour invades its territory; and if the situation, &c., be a suitable one for it, and the season favourable, its flowering may be depended upon in due time. It flowers freely, especially after fine hot summers or dry autumns; that of last year being on the whole favourable, the display of blooms this season has been better than for some years, and we all know that when they do bloom well they are not easily excelled by flowers of any other kind. The spikes of fully expanded blossoms being certainly longer and more dense than even the best-grown Hollyhocks, and the rigid upright growth enhances its value.

Unfortunately its season of blooming is not like that of most other plants limited to a particular time of year, but it would seem that whenever the plant attains the flowering condition it endeavours to do so, and if that should be in autumn, well then all hopes of a successful issue is gone; and such being the case last autumn, several plants that had shown bloom and advanced a little way towards that object were arrested by the severe weather, and were truly and practically "nipped in the bud." Some, however, did not ad-

vance thus far, and have bloomed well this season in most places where they are grown. Amongst others in this neighbourhood was a fine plant in the garden of L. D. Wigam, Esq., at Oakwood, near Maidstone, which had three fine spikes of bloom upon it; and as we all know only a comparatively small proportion of plants bloom every year, and with only one spike each, the other is the more remarkable, and I have only once seen it equalled, and that was here seven years ago, when a plant, I think of *Y. recurva*, had three spikes of bloom upon it all at one time, and each about 10 feet high; but we have not any this season with more than one stem, and as several were destroyed, or rather their bloom spikes were killed in the winter, we have not had so many this season as has often been the case. Neither have those of *Y. recurva* been so good as they often have been; but one of *Y. gloriosa*, or what I have always called *gloriosa*, a rigid-leaved one, the leaves in the centre slightly ribbed—no doubt to assist their stiffness; this plant I thought had bloomed so well that I took the trouble of counting the flowers, as well as measuring it.

The plant alluded to grew in a border along with several others in a sheltered place. A wall 10 feet high sheltered it on the north, and trees and shrubs did the same in other directions, it being, however, tolerably open to the south. The stem of the plant was destitute of leaves for about 18 inches up; after which a dense mass of foliage terminated in the flower spike, which up to the last remained as nearly upright as possible from the collar of the plant to the tip of the spike. The said spike consisted as usual of a central stem and a number of branchlets of each from 9 to 18 inches long, and so densely loaded with flowers that the weight of the whole must have been no slight matter packed as they were so closely together. The height of the plant and stem to the base of the lowest branchlet was 5 feet 6 inches, and from the base of the lowest branchlet to that of the highest one was 5 feet; while the centre spike rose 1 foot 7 inches higher still, making the total height of the plant when in flower, measuring from the ground, 12 feet 1 inch, or the length of flower spike 6 feet 7 inches, every part of which was densely packed with its beautiful egg-shaped blooms of a beautiful pale colour, and each about the size of that of a duck's egg or larger. The total number of flowers was 701; the number of branchlets being forty-two, each having from nine (the lowest number) to twenty fully perfected blooms upon it, the number on the terminal spike being thirty. It would be wrong to say that the whole of these were all out at one time, but it is not too much to say that quite five hundred must have been in perfection at once, and the others in advanced bud. Has that been excelled anywhere? and under what circumstances was the plant grown that excelled it?—J. ROBSON.

### NEGRO LARGO FIG.

A few years ago this variety was strongly recommended by Mr. Fleming, but as it had only just been put into Messrs. Veitch's hands for propagation, plants were not attainable. This year two plants, which I obtained from that firm, have fruited, and perhaps it may not be uninteresting to your readers to learn the result.

The plants are vigorous growers, and I define this by saying that when stopped at the fifth leaf, instead of merely forming a dormant bud they shoot forth again strongly. The fruit is large, high flavoured, and earlier than the average, but it has one defect—namely, that the neck, though thick, is not strong enough for the fruit, and when the latter falls downwards in ripening the neck generally gives way, splitting in two, and the fruit breaks off. It might, however, be tied up. So, on the whole, I recommend this variety as worthy to be grown even in a very limited collection.—G. S.

### NEW BOOK.

*Insectivorous Plants.* By CHARLES DARWIN, M.A., F.R.S., &c. With illustrations. London: J. Murray.

THIS, like all the writings of Mr. Darwin, is very interesting and exhaustive. All who are conversant with plants know that the leaves of the Venus's Fly-trap, *Dionaea muscipula*, and of the Sundew, *Drosera rotundifolia*, have the power to close over any insect that alights upon their upper surface; but no one has examined the phenomena so accurately as Mr. Darwin. We will combine several extracts from his pages relative to the Sundew:—

"If a small organic or inorganic object be placed on the

glands in the centre of a leaf, these transmit a motor impulse to the marginal tentacles. The nearer ones are first affected, and slowly bend towards the centre, and then those farther off, until at last all become closely inflected over the object. This takes place in from one hour to four or five or more hours. The difference in the time required depends on many circumstances—namely, on the size of the object and on its nature—that is, whether it contains soluble matter of the proper kind; on the vigour and age of the leaf; whether it has lately been in action, and, according to Nitschke,\* on the temperature of the day; as likewise seemed to me to be the case. A living insect is a more efficient object than a dead one, as in struggling it presses against the glands of many tentacles. An insect such as a fly, with thin integuments, through which animal matter in solution can readily pass into the surrounding dense secretion, is more efficient in causing prolonged inflection than an insect with a thick coat, such as a beetle. The inflection of the tentacles takes place indifferently in the light and darkness; and the plant is not subject to any nocturnal movement of so-called sleep."

"I have repeatedly found that the tentacles remain clasped for a much longer average time over objects which yield soluble nitrogenous matter than over those, whether organic or inorganic, which yield no such matter. After a period varying from one to seven days the tentacles and blade re-expand, and are then ready to act again. I have seen the same leaf inflected three successive times over insects placed on the disc; and it would probably have acted a greater number of times. Particles of carbonate and phosphate of ammonia and of some other salts, for instance sulphate of zinc, likewise increase the secretion."

"The absorption of animal matter from captured insects explains how *Drosera* can flourish in extremely poor peaty soil, in some cases where nothing but *Sphagnum* Moss grows, and Mosses depend altogether on the atmosphere for their nourishment. Although the leaves at a hasty glance do not appear green, owing to the purple colour of the tentacles, yet the upper and lower surfaces of the blade, the pedicels of the central tentacles and the petioles contain chlorophyll, so that, no doubt, the plant obtains and assimilates carbonic acid from the air. Nevertheless, considering the nature of the soil where it grows, the supply of nitrogen would be extremely limited, or quite deficient, unless the plant had the power of obtaining this important element from captured insects. . . . A plant of *Drosera*, with the edges of its leaves curled inwards, so as to form a temporary stomach, with the glands of the closely-inflected tentacles pouring forth their acid secretion, which dissolves animal matter, afterwards to be absorbed, may be said to feed like an animal. But, differently from an animal, it drinks by means of its roots; and it must drink largely, so as to retain many drops of viscid fluid round the glands, sometimes as many as 260, exposed during the whole day to a glaring sun."

"The glands alone in all ordinary cases are susceptible to excitement. When excited they do not themselves move or change form, but transmit a motor impulse to the bending part of their own and adjoining tentacles, and are thus carried towards the centre of the leaf. Strictly speaking, the glands ought to be called irritable, as the term sensitive generally implies consciousness; but no one supposes that the Sensitive Plant is conscious, and as I have found the term convenient I shall use it without scruple."

We pause over the last sentence, for we cannot comprehend how a plant can be irritable without being sensitive, nor how it can be sensitive without being aware of a sensation. There are too many phenomena evidence that they are sensitive—that they are conscious of what will benefit and what will injure them—for us to conclude otherwise. How else can it be explained that they direct their roots to the surface if this be manured? How else can it be explained that they extend their stem and branches towards the light?

"Everybody must have observed that they bend towards the point whence its brightest influence proceeds. M. Bonnet, the French botanist, demonstrated this by some very satisfactory experiments, in which plants growing in a dark cellar all extended themselves towards the same small orifice admitting a few illuminating rays."

"Almost every flower has a particular degree of light requisite for its full expansion. The blossoms of the Pea and other papilionaceous plants spread out their wings in fine weather to admit the solar rays, and again close them at the approach of night. Plants requiring powerful stimulants do not expand their flowers until noon, whilst some would be destroyed if compelled to open in the meridian sun—of such is the Night-blooming *Cereus*, the flowers of which speedily droop, even if exposed to the blaze of light attendant on Indian festivities."

"These and other facts surely demonstrate sensation to exist

in plants as acute as that possessed by the superior or more perfect classes of animals, yet they certainly are satisfactory evidence that some plants possess it to a degree nearly as high as that with which the zoophytes, or even the polypus and leech, are gifted. Some of these animals may be cut into pieces, and each section will become a perfect individual; of others, their heads being taken off may be grafted upon other bodies; and a third class of them may be turned with their insides outwards without any apparent inconvenience."—(*Science and Practice of Gardening*.)

## THE OLD MARKET GARDENS AND NURSERIES OF LONDON.—No. 4.

No, I am not prepared to vouch for the truth of the story that Clerkenwell received its name from the circumstance that an early apostle of teetotalism had there a ducking from the unappreciative mob, which declared that the clerk should have enough of water if he so much commended it, while the lads ran away from the watch with the cry, "The clerk's in the well! the clerk's in the well!" And to some extent the description given of the place by an enthusiastic writer of several centuries ago is also open to doubt, for he dilates on pleasant fountains, cool valleys, breezy hills, and beautiful gardens, which, if ever they existed, have left no trace, or next to none, in Clerkenwell of the present. But his narrative is not a pure romance, and the history of some of our earliest nursery gardens at least is closely connected with that of Clerkenwell—that is, using the word in a qualified sense, for hardly a nursery approaching in its character to what we now understand by that term can be pointed out until the Stuart period. In the early English attempts at methodical gardening there was very little "nursing;" it was thought sufficient to sow the seeds or insert the slips, and Nature was left to do the rest. And yet in some things our ancestors were rather particular, not to say fussy, as appears from a rare pamphlet written by a citizen in the form of a dialogue, the object being the commendation of the beauties of Moorfields. He chronicles the exact number of trees within the enclosure, amounting to two hundred, fourscore, and eleven. Outside, he says, there were a few more, which he roughly estimates at about thirty or forty. It would not have been a very serious piece of business for one wealthy citizen to have planted all these trees, but it seems they were the gift of various persons, and so they were distinguished as they grew by the names of the donors, or by some event in their history, so that most of these trees (Elms I suspect) had their proper names. One of them, writes our author, is called "Stubbs his tree," since it was planted by Christopher Stubbs, a principal porter of Blackwell Hall. O William Shakespeare! there is much in a name, even in the case of a tree.

Having alluded to the name of the district, once undoubtedly rural, but now far too near the centres of London activity to present any attractions except to the man of business or the antiquarian, I might add that the clerks' well really had its designation from an annual custom of the clerks, who would meet close by this well to enact miracle plays. The well or spring, with another close to it, lay in a little valley, and as the ground rose gradually to the south and west spectators could conveniently group themselves on the slopes, these same slopes being subsequently found to be admirably suited for gardens. Since there was scarcely any notion amongst early gardeners of such a thing as artificial drainage, they frequently made choice of hills, for, especially near London, they had large experience of the disadvantages arising from marshy or swampy ground. As London increased during the fifteenth and sixteenth centuries the well-to-do citizens were led to go farther afield, and as they could not have garden plots to their taste in the city they went out to Clerkenwell, or to the adjacent manor of Finsbury, and took land there. And those who are curious in these matters may still inspect an old document which contains a minute specification of the way in which the great garden and orchards of the manor of Halliwell (*alias* Finsbury) was subdivided into allotments during the reign of Queen Elizabeth. There is a long list of various citizens, whose trades or occupations are duly specified—a goodly number of them are merchant tailors; but in the account of one plot of land, called Benhil Field, abutting south on a highway known as Chiswell Street, and north on the highway from Wenlock Barn to the well of St. Agnes is Clere, the whole amounting to 23 acres, we discover, with several others, one William Gill, gardener, the only person seemingly,

\* "Bot. Zeitung," 1860, p. 24.

of about twenty, who cultivated the ground in this district with a view to the making of a living by so doing. In another place the same Gill appears as the owner of a tenement and gardens on the east side of Golding Lane. Possibly he did not succeed very well, for, as I have already hinted, citizens and gentlemen who had gardens and orchards used to allow their servants to dispose of any excess of produce, which was not encouraging to those who had begun to follow gardening as a business. I am inclined to suspect that transactions by way of barter were not uncommon amongst the citizens, and those who didn't cultivate gardens were no doubt glad to get fruit and vegetables from their friends or neighbours who did. The adjustment would be awkward in some instances, as in a computation as to how many Cabbages must be handed over to pay for a new bow and arrows, or to work out the price of a roll of cloth in Artichokes and Melons might be puzzling. Meanwhile it remains as a singular fact, against which I do not believe that any contradictory evidence can be brought, that the earliest persons who professedly reared plants to make a profit by them were the dealers in herbs. Ordinary individuals felt no hesitation about growing vegetables and fruits, but they were afraid to tamper with plants popularly accredited with mysterious virtues, though many of these "simples" had very slight efficacy. It is likely, too, that in the more war-like periods of our history the pursuit of gardening was viewed with a degree of contempt; and though servants must necessarily have been thus employed in the establishments of the citizens and others, men quite free to choose may have preferred anything to being a gardener. Hence it is not until 1616 that we have recorded the formation of the Gardeners' Company with these arms, "the field a landscape, the base variegated with flowers, a man as the device vested round the loins with linen digging with a spade. Crest, a basket of fruit. Supporters, two emblematic female figures with cornucopias representing plenty." The motto of the words, "In the sweat of thy face thou shalt eat bread," is not particularly applicable, at least in these times there are many employments which excite perspiration far more than the gardener's, unless, indeed, you are entirely "amongst the stoves." I don't know whether the Company had its quarters at one time in "Gardeners' Lane, Thames Street, where there was a full-length wall entablature of a gardener with a spade, and the date of 1670. Running northwards from the Thames out of the same street is Garlic Hill; and close to it the church of St. James's, Garlickhith, also kept in remembrance the fact that on this part of the river's bank Garlic used to be sold, not grown, as some persons have conjectured. Our ancestors were in their love of Garlic notably different from the most of us.

During the seventeenth century, and even in part of the eighteenth, those who endeavoured to make a profit in the vicinity of London by the culture of gardens and orchards not only sold the bulk of their produce on their premises, but actually saw it consumed there. The worthy cit, with his "better society" and the cutlins, took his way once or twice a-week to the suburban districts and devoured as much fruit as, by proper allowance, might have sufficed for several days. Many such excursions for fruit-eating and the like are duly set down by the indefatigable Pepys in those memoirs which have amused the world, and of which, by-the-by, we are ere long to have a new edition, containing matter hitherto suppressed or undeciphered. At last, however, acting on the proverb that "the traveller spends more than the abider," Londoners found out that vegetables and fruit might very conveniently be brought to their doors, and save them the trouble of going out in order to revel in them. Hence the race of coster, or costardmongers, who supplied the streets at a cheap rate long before shops were opened for the sale of such commodities. The Cherry gardens at Clerkenwell, situate near Bowling-green Lane, took their name from the fruit that was most in request there; and exactly two hundred years ago a chronicler reports that there were only six houses in the locality, and a great extent of orchards and gardens. For a good while this place retained its fame as a tea garden after the encroachments of houses and the springing-up of larger market gardens in better situations north and west had rendered the Cherry gardens of small importance otherwise. Then there was a Mulberry garden at Clerkenwell as well as at Pimlico, the site of which is now occupied by the House of Detention; and though it took its name from the Mulberry there was a great variety of trees planted in the extensive garden grounds situate here in the eighteenth century. No doubt the Mulberries had an earlier date; we may reasonably suppose that

these were planted in the reign of James I., when that sagacious monarch offered packets of Mulberry seed to all persons who would undertake to sow them, hoping to see himself, or to prepare the way for, an extensive production of English silk. Also we are informed that in 1609 a French gentleman distributed about a hundred thousand young trees in England of the common or black Mulberry. These must have been in good bearing condition in 1742, when the Mulberry gardens were opened as a public resort, and the land was under cultivation for about fifty years more, when it was cleared for the builder. These gardens did not occupy an elevated position in Clerkenwell, but laid rather in a hollow far below the level of Pentonville. On ground decidedly higher—so much elevated, indeed, as to be called the "Mount"—was once a vineyard, even yet connecting itself with the present hour by the locality that bears the name of Vineyard Walk. It was then surrounded by gardens, and on the western slope of this hill or mount the Vines were trained row above row, and on the top of the ascent was a cottage occupied by the individual who had the Vines in charge. From an old advertisement it would appear that there was a fishpond on these premises which was visited by the curious. The Clerkenwell Vines were probably in their most flourishing state during the sixteenth century.

At the corner of Ashby Street, Clerkenwell, stood the old Manor House, from the history of which it is worth our while to extract this fact, that in the eighteenth century, between the years 1780-50 or some part of that time, it was in the occupation of an eccentric herbalist, Dr. Newton. He prided himself upon his knowledge of botany, and kept a private asylum for lunatics! There were several acres of land attached to the house (which was also called "Wood's Close"), and these the doctor laid out rather elaborately as a botanic garden. He had the honour of a paragraph in the *Daily Post* of Aug. 25th, 1780 (just in the dull period when newspapers are still glad to record enormous Gooseberries and the like), mentioning a curious Lily grown in this garden at Clerkenwell, having a cluster of roots proceeding from the top of the stalk. The book on which Dr. Newton had worked for some time, but died ere he completed it, was published by his son in 1752, containing with plates medico-botanical information "of the period."—J. R. S. C.

#### CLEVELAND HOUSE, CLAPHAM PARK.—No. 1. THE RESIDENCE OF S. RALLI, ESQ.

Some time ago "WILTSHIRE RECTOR" in recording a visit to Balham spoke of it as "treey" Balham. A more truthfully descriptive term could not have been selected, for although almost within cannon-shot of Westminster Abbey trees abound everywhere.

Balham is the nearest railway station to Cleveland House, therefore at Balham station I found myself on a sultry day in August. On descending from the platform a word of the Rector's advice recurred to me, and which I turned to useful account. "If you desire," said he, "intelligible directions appeal to a butcher's boy." I did so, who in response to my inquiry for Cleveland House stated, "Go straight a-head, sir, until you come to the second turning on the right—a butcher's shop is at the corner—follow the turning as straight as you can; you will come to two or three branch roads, but follow the straightest, which will take you to Thornton Road; then turn again to the right, and the second gate on your right leads to Mr. Ralli's. If you keep in mind these three 'rights' sir, you cannot get 'wrong.'" That was the butcher's boy's direction, which cannot be improved on, and which is therefore given for the benefit of any who may be bound on the same pilgrimage as myself.

I trust the number of such pilgrims may be great, for a floral feast is spread at Cleveland House which, though on a small scale, is probably not to be surpassed in the three kingdoms in the perfectness of the style known as carpet bedding. All who admire this mode of garden decoration should see this admirable example of Mr. Legg's skill, and they will be confirmed in the correctness of their taste in pronouncing it beautiful. All who do not so readily appreciate this style of gardening should see it also, when, if they are not at once converted to the mode, must admit its effectiveness, or, at any rate, they will not be able to speak slightly of its decorative force. Mr. Peach may come all the way from Yorkshire, and will not consider his time wasted in an inspection of these finished beds; Mr. Luckhurst, with his high ideals of garden

decoration, may venture a journey from Sussex, and will, mayhap, find his ideal realised; "D., Deal," the redoubtable champion of florists' flowers, may come, and perhaps his Carnations may give him greater enjoyment by the contrast of this style of gardening and that; and Mr. Douglas may arrive from Essex, and the sweetness of his Phloxes and the stateliness of his Gladioli will be none the less enjoyable after the change of fare which he will admit is spread by a master's hand.

All these and others may come and not feel that they are intruders, for I have authority to say that Mr. and Mrs. Balli,

with a generosity which all true gardeners must appreciate, are desirous that that which is so greatly enjoyed by themselves should also be enjoyed by others. For that graceful act of generosity the whole gardening fraternity owe the owners of this garden a hearty vote of thanks.

Yet this is not a great but a small garden, the part under notice not exceeding two acres; but if small it is good both in its design and perfect keeping. The mansion is a square erection in the Grecian style of architecture. On the south-west front is a terrace, at the foot of which are the almost matchless

Fig. 40.

carpet beds. They are arranged on a circular piece of lawn about 60 feet in diameter, which is surrounded by a walk, and bounded opposite the house by a raised bank of evergreens fringed with *Ricinus*. This green fringe is an appropriate framework for the brilliant picture which it partly encircles. The principal beds are only seven in number—a circular bed 12 feet in diameter, and six oblongs each 20 feet in length, and of an average width of 6 feet. In these beds—a border 60 yards long by 8 feet wide, and a few other minor beds—upwards of sixty thousand plants are arranged, and there is not in carrying out the designs one plant too many or—such is their completeness—one too few.

The beds are raised—that is, ramped up by turf to about a

foot above the lawn level, and the surface of each has a very gentle rise towards the centre. In planting and finish they are perfect, and in colouring brilliancy is combined with chasteness. Rich tones are imparted by Golden Feather and *Alternantheras*; a cool yet lively character is given by the free use of *Mesembryanthemum cordifolium variegatum*; while quietness and repose are afforded by a dense neutral carpet of *Sedum glaucum*, brightened gently yet effectively by glowing tufts of the lovely alpine plant *Nertera depressa*. The association of these two lowly gems is the *chef-d'œuvre* of Mr. Legg's taste. The dense and brilliantly-berried *Nertera* nestling in the silvery-grey carpet of the miniature *Sedum* is a happy idea admirably carried out. If the birds do not carry off the berries

## MODE OF PLANTING THE BEDS.

## BED A.

1. *Tagetes signata pumila*.
2. *Mesembryanthemum cordifolium* variegatum.
3. *Alternanthera amabilis*.
4. *Pyrethrum Golden Feather*.
5. *Alternanthera paronychioides* major.
6. *Echeveria secunda glauca* and *Sedum glaucum*.
7. *Alternanthera amona*.

## BED B.

1. *Santolina incana*.

3. *Mesembryanthemum cordifolium* variegatum.
4. *Alternanthera amabilis*.
5. *Pyrethrum Golden Feather*.
6. *Alternanthera amona*.
7. *Echeveria secunda glauca*.
8. *Sedum glaucum* dotted with *Nertera depressa*.
9. *Alternanthera paronychioides*.
10. *Stellaria graminea aurea*.

## BED C.

1. *Alternanthera paronychioides*.
2. *Sempervivum calcaratum* and *Sedum glaucum*.
3. *Pyrethrum Golden Feather*.
4. *Alternanthera magnifica*.
5. *Mesembryanthemum cordifolium* variegatum.
6. *Pachyphiton bracteatum* and *Sedum acre elegans*.

## BED D.

1. *Dracena indivisa*.
2. *Golden Feather Pyrethrum*.
3. *Alternanthera paronychioides*.
4. *Mesembryanthemum cordifolium* variegatum.
5. *Sempervivum californicum*.
6. *Alternanthera amona*.
7. *Echeveria secunda glauca*.
8. *Tagetes signata pumila*.
9. *Alternanthera paronychioides*.
10. *Stellaria graminea aurea*.

D  
Fig. 41

the beauty of this combination will be sustained throughout September. As seen from the terrace these beds are simply beautiful, while each will bear the closest examination; but to comprehend their beauty to the fullest extent they must be looked down upon from the upper windows of the mansion. For that privilege I am indebted to the special kindness of Mrs. Ball, and I have been thinking of it and dreaming about it ever since.

In these elaborate beds, which are so full, level, and smooth,

with sharply-defined lines of colour, now brilliant and now soft, not one flower is to be seen. It is carpet bedding *par excellence*, and proves that no flowers are required. Even blue Lobelias would have spoiled this design, for, as the present season has proved, they cannot be kept within the precise bounds required. Mathematical precision is the very essence of this mode of garden decoration. There must be no uncertainty as to what height and breadth a plant will grow. Ideal lines must be drawn, and beyond or above these the plants must not be permitted to travel, and, further, they must be of a nature not to receive injury to health or appearance by being restricted within these limits. These conditions cannot be attained where flowers are admitted. It is the judicious employment of foliage alone which constitutes true carpet bedding, which neither receives injury by sun nor rain, and which affords all the colours and shades required to create an imposing effect. The effect of these beds is due to foliage alone, with the one solitary exception of the bright clusters of berries of *Nertera depressa*, which stud, like brilliants in a silvery sea, the smooth carpet of *Sedum glaucum*.

How are such panels as *Tagetes* and *Golden Feather* kept to the level of *Alternanthera amara* or the *Sedum* above mentioned, which does not grow more than 2 inches high? It is not only the result of pinching the tall plants—for that alone would not suffice—but also by raising those which are of dwarf close growth. The soil at planting time for one is raised, while the site for another is sunken. The centre bed, fig. 41, affords a clear example. The groundwork is composed of *Mesembryanthemum*, the panels being formed of *Tagetes* and *Alternanthera*. Had all been planted on the same level the severe pinching of the *Tagetes* to keep it down to the required level would have marred its effect, but by planting it in panels a few inches below the bed level, and by planting the *Alternanthera* on mounds an inch or two above the said level, the surfaces of each plant are on the exact level required. To this care Mr. Legg mainly attributes his success. He knows the habit of each plant, and provides accordingly by sinking the lines of those which grow tall and raising the sites of those which grow dwarf. More time is absorbed in planting, but it is recovered again by less being devoted to pinching. But to these beds are ungrudgingly devoted time, skill, and labour (for they cannot be produced without), but the greater the investment of means the greater is the triumph achieved.

Unless both skill and labour can be commanded carpet bedding should not be attempted, for without these essentials there can be no success, but with them a picture may be wrought such as it is impossible to justly portray by either pen or pencil. To attempt an engraving of these beds would only be a libel on the beds themselves, but a design with the mode of planting will give the best idea of the most advanced and perfect type of carpet bedding of the day. The design, which is simple and effective, is adapted to either a large or a small garden, and the form of the beds is such as to afford scope for working-out striking patterns in planting. Fig. 40 shows the design greatly reduced, and which shows also the outer circle of dwarf Conifers. The figs. on page 207 show the beds on a scale of a quarter of an inch to the foot, and the mode of planting. They are planted in duplicate.

It should be noted that the carpet beds, as will be seen by the general plan, are relieved by circles; these are filled with subtropical plants, which afford an agreeable relief to the bright colouring of the carpetwork. These beds are filled with *Ferdinandia eminens*, edged with *Chamaepycnos diacantha*, *Wigandia* and *Coleus*, *Melanthus major* and *Coleus*, *Canna* and *Salvia argentea*, *Ricinus* and *Chamaepycnos cassabona*. Beyond the beds is an outer circle of choice Conifers planted at wide intervals.

The next garden front—the north-east—is totally different to this, from which it is judiciously separated by a raised scroll-shaped bed of *Rhododendrons*. It is a simple expanse of lawn perfect in texture and keeping. It contains only one solitary carpet bed near the front door, and along its margin are small specimens of rare Conifers, as *Sciadopitys verticillata*, *Cryptomeria*, *Retinosporas*, &c. This open expanse of lawn is an example of good taste. But let us look at its boundaries. Its furthestmost boundary is artistic beds of shrubs, through the foliage of which a glimpse of the vineries is obtained, but the eye is irresistibly drawn to the left to the glorious bank of flowers. This bank is steep and surmounted by evergreens which screen the plant houses and frame ground. The bank is 60 yards in length by 8 feet in width, and is of graceful curvature. It is a striking design of flowers

and foliage, the *Coleus* especially being in splendid health and colour. It is brightened by *Geraniums*, and edged with *Lobelia* and *Hebeveria secunda glauca*. In design and quality it is impossible to imagine anything more imposing. It is a brilliant boundary to a velvety lawn, and with the beds just noticed, drew forth the following exclamation from a gentleman who is no stranger to superior gardening, Mr. Campbell of the Churchill Nurseries, Glasneven, who said, "If I had seen nothing else in England, and I have seen much, I should be well satisfied with my visit from Dublin." No more need be said on that side of the garden, and but little on the other boundary.

This is again a total change, being composed of rugged roots, and the cool green fronds of Ferns luxuriating under the dense foliage of timber trees. This cool retreat is made still cooler by a fountain, and the sense of rest is further suggested by a rustic grotto and inviting chairs. On the front next the lawn is an herbaceous border. Such in brief are these two lawns, their dispositions and surroundings, each of which enhances the beauty of the other, and which affords an example of decorative gardening on a limited scale which is certainly worthy of notice and emulation.

"But is there nothing else but a bit of flower gardening to see?" some may ask. Yes, there is a bit of Vine-growing and a bit of plant culture at Cleveland House, but these I will notice next week.—W.

THE first part of "The Dictionary of English Plant-names," edited by Mr. J. Britten, Botanical Department, British Museum, is printing. He will be obliged by information relative to local names.

#### NOTES ON VILLA AND SUBURBAN GARDENING.

KITCHEN GARDEN.—September is upon us, and many things will have to be attended to in this department. For instance, it is the month for ripening and storing many of the crops, such as *Onions*, the general crop of which will now be ripening-off, and will do no more good in the ground; therefore pull them up, and while the weather is fine let them lay upon the ground even for a week or more, then gather them in, and on the first opportunity string them on to sticks about 2 feet in length, and hang them up in some dry cool shed; but not where damp and frost reaches them. They keep better in this way than any other I know. Those pricked-out or sown later may be left in the ground a little longer; but if wet weather comes upon them take care that these are used first, as late crops of this bulb do not keep well. Those sown last month to stand the winter should be kept very clean on the ground, and be thinned as soon as possible, and all vacancies in the rows filled up.

This is the month for the growth of the general crop of *Celery*; it makes more progress during this month than any other. Take care that the plants are well supplied with water, because if they were put out at the proper time they will have filled their allotted space with a multiplicity of roots, which must now have something in the shape of nourishment to keep them going apace. After the plants have reached a fair size, say about half their growth, and if water has at all times been liberally supplied, the earthing may commence. I seldom like to commence this work very soon, except in the case of the earliest, which must be earthed in order to have it properly blanched.

Take care to advance as much as possible the sowing of *Cabbages* which are intended for spring use. The Onion bed is a place for these to be planted, because the manure applied to the Onions is so far exhausted by that crop that the *Cabbages* do not grow too coarse and become too tender to stand the severity of winter. Transplant the *Cabbages* about 1 foot apart in the row and at least 2 feet between the rows. Every other one of these can be cut out about Christmas time, and the stalks pulled out, and the first fine day the ground is put in order about them, and they go on successfully.

Plant out all the Lettuces and Endive possible, a store of these is very valuable; and remember those that do come in for use will not be large, and therefore will not go so far as a good summer Lettuce, consequently more than as many more will be needed; and the ground should be the best the garden affords. Those from sowings made now will not be likely to come in for use, but it is necessary to have plenty of plants to put out thickly under walls and on warm borders; therefore if a sowing is not already made it should be done at once.

Leaks in trenches and on warm borders must during this month have plenty of liquid manure, for it is also the time when this plant makes wonderful growth. If the plants are making too much leaf according to the stem clip off some of the large and drooping leaves, this will help to increase the size of the stem.

The crop of Spinach advised to be sown two or three weeks ago is well up by this time, and should be succeeded by another crop of the same sort; this will be more for spring use, and the first one for winter. As this advances the ground should be kept clean while the weather is suitable.

Tomatoes will be late this year, and indeed at one time I thought the weather would prevent any crop coming at all; however, even now they are somewhat diseased similar to the Potato, and these have been picked off and the diseased leaves also. The ground about their roots ought to be stirred, and a mulching of rotten manure placed about them; afterwards a good watering, and to be repeated twice a-week. All growths to be stopped and all flowers picked, so as to prevent any more fruit setting and to encourage the growth of the fruit that is set. Even some of the bunches of fruit will need thinning; this occurs more with the Orangefield and the common red than the larger sorts; but if all sorts set properly there should be a little done to them all.—THOMAS RECORD.

## DOINGS OF THE LAST AND WORK FOR THE PRESENT WEEK.

### KITCHEN GARDEN.

THE Potato is the most important vegetable cultivated in our gardens, and any information that can be obtained likely to check the disease will be welcome to all. We stated two weeks ago that the haulm had been removed from a lot of Dal-mahoy, and the earth drawn up over the rows to fill-up the holes made by drawing out the haulm, and also to throw the rains off the Potatoes. The way the haulm was removed was this: a man placed both his feet close to the plant with the stalks between them, and with one pull the stalks were removed, leaving the tubers in their places. After three weeks the disease does not seem to have made any further progress. It may be as well to state that we have had but one night's rain since the haulm was removed, and the ground is very dry. Our belief is that removing the haulm when the crop is first attacked is a means of checking the disease. Others have been trying it, and the result if published would be very useful. The later sorts are slightly attacked by the disease, but if the present fine weather continues it is not likely to spread much. Have been making the ground ready for Onions and other crops mentioned in the "Doings" two weeks ago; we would rather that there were more moisture in the ground before sowing the seeds. Some rich manure has been dug-in, and before sowing the Onions the ground will be trodden-in quite firmly. Trimming hedgerows round the garden. If this work is done now some little growth will be made before the winter sets in—just enough to hide the marks of the shears. Ours is a Privet hedge, and has a very neat appearance. Sometimes Yew hedges are planted to enclose the kitchen garden, and when trimmed neatly they have a very good effect. The hedges may be of any height, but 6 feet ought to be the maximum. We continue to gather Pears and Apples as they ripen, and gather fallen fruit daily.

### CUCUMBER AND MELON HOUSES.

Our system of growing Cucumbers is rather different from that pursued by many gardeners. The usual way is to grow plants from seeds, and for a winter crop of fruit the first day in September is a good time to sow the seeds. As to the best sorts to sow, this will depend very much upon the tastes of the owner. Many gentlemen like to see the Cucumbers growing, and prefer long handsome specimens to large crops of small though useful fruits. On the other hand, the gardener who is required to send a Cucumber in to the house every day during the winter months, must grow the sorts that produce small fruits. We have seen a large number of different varieties during the last few years, and it is just possible that Rollisson's Telegraph has not yet been surpassed. We do not require large quantities of Cucumbers during winter, and Tender and True gives us an ample supply. Four plants are sufficient for us. We propagate either by layers or cuttings, as it is so difficult to obtain seed from this variety. One thing is of very great importance whether the plants are raised from seeds or cuttings, and that is to grow them on without any check to their growth, nor should the plants become drawn-up for want of sufficient air. Place the pots close to the glass from the earliest stages of their growth, and while the plants are in pots they must not become root-bound. Insect pests must also be destroyed as soon as they appear, trips and green fly by fumigating with tobacco smoke, and red spider by syringing with clear rain water. Much care is necessary when applying the water with the syringe so that the leaves are not lacerated.

Melons have been inferior in flavour this year, but the weather has been very favourable to the development of quality during the last month. Melons even more than Cucumber plants require careful attention from the first, as the leaves are even more easily injured, and it is not possible that good-flavoured fruit can be produced if the leaves are not kept in good health. Other matters on which there is much divergence of opinion, is

soil and watering. Sometimes much trouble is taken to obtain a certain sort of poor loam, not that of a fibry nature, but ordinary spit loam, and it is used without any manure being added. Good turfy loam, medium clay, with the addition of one barrow-load of rotted manure to every six, is the best material to plant them in, and 1 foot in depth of soil is quite sufficient. During such fine weather as we are now enjoying no artificial heat is necessary to ripen the fruit; later in the season artificial heat is necessary, and the ventilators should be open night and day. Then about watering. Many persons fancy that water should be withheld entirely in the later stages of the plant's growth, and they do not give large supplies at any time. It may not seem feasible to those who do not believe in giving good soakings of water, but it is a fact, that the plants damp-off at the neck sometimes because the roots have not had sufficient water, and what has been given was supplied in dribbles. If the soil has been well watered from the first, another good watering about a week before the first fruit ripens will be quite sufficient to ripen-off all the fruit. It is not the state of moisture at the roots upon which the flavour of the Melon depends, but upon the quantity of leaves that can be exposed to the sun, and the way in which the house is ventilated.

### ORCHARD HOUSE.

When the trees are grown in pots the trouble of watering during the hot days of midsummer is immense, to say nothing of drenching the trees overhead twice a-day with the garden engine, but when the fruit is ripe the labour involved in assisting it to that stage is forgotten. At present the trees have just enough water to keep the soil moist; indeed much of the quality of the fruit depends upon the state of the roots as regards moisture at this season. Nearly all the mid-season Peaches and Nectarines have been gathered. Desse Tardive and Exquisite, two very fine varieties, are just coming in. At one time we used to tie gauze or some sort of netting under the fruit to prevent it from falling to the ground, but when Peaches are allowed to hang until they drop off the flavour is impaired. The best way is to look over the trees once a-day and carefully pick off all fruit that parts readily. It ought to be placed in a flat-bottom basket at once on a layer of cotton wadding, and be placed in some cool cellar or fruit-room, without removing it from the basket. Pears ought also to be gathered before they are ready to drop off, especially such sorts as Williams's Bon Chrétien and Rivers's Summer Beurré d'Arenberg; the last-named variety will decay at the core as it hangs on the tree. The varieties that have been already gathered in the orchard house are Williams's Bon Chrétien, Summer Beurré d'Arenberg, Madame Treve, Beurré d'Amanlis, Beurré Hardy, and Souvenir du Congrès. All of the above are first-rate sorts for orchard-house culture. The ventilators are now left open all night. This treatment with plenty of sun heat has much improved the flavour.

### PLANT STOVE AND ORCHID HOUSES.

The principal work has been cleaning and re-arranging the plants in the houses after being painted. In order to reach all the crevices the fixed lights were taken off and painted before they were put on again. Very little is required now amongst the plants except to see that they have plenty of room, and that they are kept clean and as much exposed to the sun as possible without being injured. Marantas, Alocasias, and a few other plants will suffer from a too free exposure to the sun as yet, but none of the hardwooded species of stove plants should be shaded after September. Phalenopsis and Cyrtopodiums may yet be shaded, while Cattleyas, Lælias, &c., should be fully exposed to the sun after this. Poinsettia pulcherrima, which has been out of doors up till now, has been removed into the house. The best way to grow this useful decorative plant during the summer is in the open air. The plants remain sturdy and healthy, nor do the bottom leaves part so readily from the stem. After the first day of September they are placed in a house near the glass, and if necessary the night temperature is kept up artificially to 55°.

### FLOWER GARDEN.

The Gladiolus is now one of the most popular of autumn flowers, and is in considerable request for decorative and exhibition purposes. Many of the best-named varieties are of very delicate constitution, and degenerate under cultivation in England. It is a good plan to stir the ground amongst the plants with a Dutch hoe after the flowering is over, or if the ground has become a little sodden from watering it may be forked-up to the depth of 2 or 3 inches. This has been proved of much advantage in ripening the bulbs. In a large collection there are always a number of plants of which the stalks die off prematurely; the best way is to pull all such up and tie them in bundles to burn. Some of the best growers consider this a disease, but it is probably nothing but degeneration, as no trace of disease is apparent on the corms. Asters have flowered very finely this season. This is also becoming a very popular autumn-flowering plant. The improvement in both sections has been great within the last six years; not only has better form and quality been produced in the flowers, but the colours, especially in the

French Asters, are much more brilliant. The soil ought to be deeply trenched in the winter and enriched with manure.

We have begun to propagate the bedding plants, taking Zonal Pelargoniums first. The cuttings are merely planted in boxes and placed out of doors until they are rooted. Centaureas we plant singly in small pots, or, if the cuttings are small, two are placed in a pot; they are then plunged in cocoa-nut fibre in a cool frame, and slightly shaded until the cuttings are rooted. They take longer to do this than most other plants. Verbenas, Heliotropes, Ageratums, &c., are propagated about the end of September, and the shrubby Calceolarias about the third week in October. The flower beds are apt to assume a straggling untidy appearance at this season, but they must be attended to. All weeds and decaying flowers are removed, and the lawn kept closely mown. Auriculas also require careful attention. Many of the plants throw up flower-trusses, but these ought to be removed before the flowers open, as allowing them to remain tends to exhaust the plants for spring flowering; decaying leaves are also removed at once.—J. DOUGLAS.

### TO CORRESPONDENTS.

\*. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

✶ We request that no perishable fruits be sent at present, as our authority for naming fruits is absent for a time.

BOOKS (Sakib).—Our "Garden Manual" gives the information. Post free if you enclose twenty postage stamps with your address.

FRUITING FRUITS (J. W.).—Usually in places all alike. Grapes on an inclined board as shown (No. 788, page 288), in this Journal. Quantities are specified, or ought to be, in the list of prices offered.

DIAPYCNUS HORREARIANUS (R. C. O.).—We think it likely that the Horrearianus coming up through newly-sown grass may be destroyed as are Plantains, Dock, and other deep-rooted weeds, by dropping upon the crowns of the plant all of vitriol. A single drop in the heart of such weeds as Dandelion or Plantain is sufficient to cause death, but Dock and Horrearianus have not hollow crowns as these have, therefore the crowns should be cut out with a knife, and the root left here a hollow in it, and into the cavity so formed the vitriol should be dropped. An old blanching-bottle with a wire round it to carry it by answers for the vitriol, and a stick with notches at the end for an inch or two the better to hold the vitriol, is the only instrument required. Be careful, however, in its use, not trusting it to other than a person in whom you have confidence to put it to its right use.

SUNFLOWER CULTURE (H. W.).—We presume you wish to cultivate it for its seeds, and for those to perfect the seed should be sown early, the beginning of April being most desirable, and the crop will be fit to harvest at the close of August or early in September. Drill 60 inches apart should be drawn, and the seeds sown evenly, or drilled in about an inch deep. The plants should be kept clean, and thinned to 18 inches distance apart.

YUCCA GLORIOSA (J. El Akbar).—This is blooming everywhere this year, and is the consequence of a hot season it has recently enjoyed.

EVERGREEN SHRUBS IN BANKERS' RUBBLE (Veritas).—No shrub that we know would thrive in "bankers' rubble," which we presume is some kind of stone; but if you have good soil on either side, or upon both, you may plant Ivy, the common or the Irish would grow well, and trained over the rubble would give a fine green covering. Cotoneaster microphylla might do well were you to provide some soil where you plant so as to give the plant a start, and the growth spreading over the surface would have an effective appearance.

GRAPES SHANKED (T. Upton).—"The berries on some of the bunches rather shrivelled, smaller than the others, of a muddy-red colour, and in favour sour," are shanked, which is occasioned by the roots not supplying sap to meet the transpiration taking place by the leaves. To prevent this there is no better means known than to have an increased extent of foliage, not necessarily great, but by attending well to stopping from the first, keep up a steady increase of foliage and active root action, and with the roots in an active state, and the stores of sap in the leaves, the greatest freedom from shanking is found. The allowing of the laterals to extend considerably and then removing them all at once by a severe cutting-back diminishes the rooting power, and the stores of sap are inadequate to the demands of an excessive evaporation consequent on a hot and dry day or period succeeding one of dull weather. Slow and steady progress is what is needed to maintain the balance between the head and roots, and where this is provided the Grapes do not shank.

STATING THE WHEREABOUTS (An Old Subscriber).—We endeavour to do what you rightly suggest is useful. Correspondents should always state the place where the plants they cultivate is situated.

WATERCRESS CULTURE (W. A. W.).—Full instructions for making Watercress beds are given in vol. XIV, new series, page 276.

IMPROVING THE COLOUR OF ROSES (Idem).—No manure that we know will cause the plants to have the blooms intensified in colour, but strong soil and cool manures usually afford blooms higher in colour than a light soil and stimulating manures. Exhibited blooms are shaded and kept from rains, which preserves their colour. The climate of Devon is warm, and warmth promotes the vigour of Rose trees.

PLANTING VINES (Amateur).—The best time to plant Vines in an outside border is, the Vines being kept in a cool house up to planting, when they are commencing growth; or if there is danger of rubbing off the eyes through introducing them through the aperture, you may plant them in March when the eyes are commencing swelling, and spreading out the roots, laying them out evenly over the surface of the border, and covering with soil 4 to 6 inches deep, watering with water at 70°. Other suitable Vines besides Black Hamburghs and Foster's Seedling, are Black Prince, Buckland's Sweetwater, Duke of Devonshire, Muscat Trovers, Veitch's Black Muscat.

OWENS RUNNING TO SEED (West Coast of Ireland).—We cannot account for their running to seed other than that they have attained to the seedling state from a check occasioned by a prevalence for a time after they had begun to form bulbs, of dry weather, being stationary for a time, and then from wet weather succeeding they formed thick necks and run to seed. In no other way can we account for it, unless, indeed, the seed was old, the early sowing and season causing them to attain early development.

PROPAGATING CRASSULAS (Idem).—This is as good time as any, the cuttings to be the tops of the young shoots 2 or 3 inches long, and those which have not flowered, and insert in very sandy soil, and water very sparingly, placing in a frame or in any house where there is a gentle heat, guarding against damp, and the cuttings will soon be rooted, when they may be potted off singly. Seeds should be sown in spring in gentle heat.

BOWING CYCLAMEN PERSICUM (Idem).—Sow it early in March in a hotbed, and grow on in moist heat, and the plants will flower early in the spring following. What shrub is it you wish to raise from cuttings? To name all would be to give instructions for those you may not have, nor care for.

SMALL ROSE (E. G. D.).—No culture will increase the size of the flowers. It is a small-flowered variety. You may promote the vigour of the bush and prevent its leaves becoming spotted and brown by watering the roots liberally, and keeping the surface of the soil over them mulched with half-decayed stable manure.

FLIES (?) IN GARDEN (T. G.).—We should have been glad to have seen specimens of the small insects first mistaken for Podura, and then considered as small flies. If the latter, they had probably been bred in sawdust or shavings, or, perhaps, in places where dogs or cats rest.—I. O. W.

NAMES OF PLANTS (C. P. Smith).—We cannot name plants from their leaves only.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### LES BASSES-COURS DE L'ANGLETERRE.

#### CHAPTER 3.—AYLESBURY.

To the land of ducklings and the country of butter and cream we betook ourselves to see all Mr. Fowler's live stock on the Prebendal Farms. Everyone knows Mr. Fowler. We look back at volumes of our Journal of very many years ago, and we find the name of J. K. Fowler at the top of many prize lists. In fact we should almost think he was the oldest fancier extant that has gone on, spring after spring hatching and rearing, year after year exhibiting and scattering worthy representatives of his breeds over Great Britain and America. We are glad, too, that when the time comes—which we hope will be far distant—for Mr. Fowler to rest from poultry labours, that he will have in his son a successor as able, as energetic, as courteous almost as himself. We had truly a pleasant little visit at Willow Bank, and could tell for a long time of that pretty winding garden and the smooth Badminton ground and the flowers, and last but not least of the glorious old oaken furniture in which Mr. Fowler so delights; but we have not the time or the space. "Les Basses Cours" we must here speak of, and to them, then, let us go. Very near the town are the Prebendal Farms, only a little walk from the station on the high road towards Oxford. We entered the gates that lead to the farm buildings and poultry runs, and the first thing we saw was Mr. Baldwin's house. Everyone who frequents the poultry shows knows Baldwin; with his cheery good-humoured face he always looks as if nothing could upset him, and a very excellent Duck and poultry man we should think he is to Mr. Fowler. In front of his cottage was a little enclosed lawn open to all the rays of the spring sun, and round it we saw a long range of rough shedding where the coops are placed containing the early broods of the year. This was the nursery, and a very admirable one it looked to be; and being so handy to the house the chickens could have every possible attention.

Round the farmyard we found covered-in pens littered down with straw, and in them were troops of Ducks, Rouens and Aylesburies, all perfect monsters. We suppose Baldwin picks out the best and takes them to other quarters to prepare for exhibition, though as far as that goes every bird in those pens seemed worthy of a prize. We then came to a pool and streams of running water. Here we saw flocks of Ducks—Rouens, Aylesburies, East Indian, and last, not least, those excellent Cayugas. It was really a wonderful sight to see that mass of Ducks, the Black, and the Brown, and the White, all in one string taking to the water. We realised then for the first time the size of the Aylesbury Duck establishments. Mr. Fowler, however, we believe, keeps many other lots out at cottages and farms; so the pick he has for exhibition purposes must indeed be considerable.

From the brook we came into a large meadow where are some of the wired-in runs, and they were something like runs. None of those little four-yard-square enclosures, but big and bonny grass places, like miniature paddocks, with moveable houses in them. When we saw these we did not wonder so much that so many prize cards come to Aylesbury. We found them full of inmates, about half a dozen in each, all in the most perfect health and living in the lap of luxury. Most of them contained prize birds, for Mr. Fowler is not one of those who, when he has a good bird, goes on showing it till it is done up; but he rings the changes all round, and everything comes in for its turn in the exhibition pen. We saw in these fine grass runs

Buff Cochins, White Cochins, Partridge Cochins, White Leghorns, Dorkings, Crêves, Houdans, and specimens of most breeds. The Crêves and Cochins struck us most, they looked so grand on those green runs. The Leghorns, too, seemed graceful and aristocratic, and of snowy whiteness. We can but congratulate Mr. R. R. Fowler on the perfection to which he seems breeding this variety. We passed on from these enclosed yards to another meadow, and there were young stock of all breeds of all ages, of all colours, enjoying unrestricted freedom on the richest of Aylesbury meadow land. Those birds must have a joyous life—good food, good water, and free liberty. When taken up for the exhibition basket, or to go to a fresh home wherever it may be, we fancy they must have a different life, and one not by any means so enjoyable as at Aylesbury.

Next we came to the rick-yards. More Ducks, more Geese, more poultry, and the Turkeys. Bronze American, Cambridge gobbling under the corn ricks—scratching in that paradise of poultry yards, growing, fattening, and thriving on the best of foods and in the happiest manner. We passed on again to another field where were moveable houses, and here we found pullets of all breeds. There were Cochins and French by dozens, each one looking better in condition than the last, and in sounder feather. Among such a troop we should have had no idea how to pick out the best half dozen; and then, finally, we went to the enclosed, roofed-in, straw-littered pens, where were the prize and exhibition Ducks and Geese for which Mr. Fowler has made his name so famous. We longed to know the secrets of blanching those Aylesbury's bills, of putting the huge weights on those Embden Geese, but we asked no questions. We revelled in their grandeur, and went away satisfied, and we believe we may say any others who go to Aylesbury may, with Mr. Fowler's permission, enjoy the pleasures that we did, and we guarantee they will not be disappointed. When we had seen all we have spoken of, and much more besides, we had not seen all, for Mr. Fowler keeps other birds in other homesteads; but we had no time to go to them, and, in fact, we had seen enough, for we had seen the greater part, and were able to realise the immense scale on which the Pribendal poultry farms were worked. We cannot help adding here that those who go to Mr. Fowler to replenish their stock, or obtain fresh blood, do not receive specimens weakened by overawing, or whose parents have been made sickly from the same cause, for their owner does not believe in that practice, consequently the cockerels and pullets coming from these yards are strong, and lusty, and fine. Before we left we were shown the plate, and a goodly lot there was, for Mr. Fowler has won champion silver trophies with his Shorthorns as well as with his Ducks and poultry; but we could but note the great difference between the poultry plate of some years back and that of the present day, for Mr. Fowler showed us massive salvers, and dishes, and jugs, whereas now so long as it is a cup it does not seem to matter how paltry the article may be. We saw the other day a cup sent out the size of a wine-glass and as slender as tissue paper, two fingers could have squeezed into any shape, and yet this was a £3 8s. prize. If we are not to compete in these days for trophies like those of olden times, let us have instead good cash prizes, and a champion cup or two for the best pens in the exhibition, or at least be allowed to choose other articles equivalent in price but more useful in themselves than the cheap deceptive cups of the present day. This is digression from Aylesbury, but the ideas flashed across us when we saw Mr. Fowler's plate won in bygone years. We have not forgotten that there is another rising poultry establishment at Aylesbury which bids fair to do great things, but Mr. Fowler had so much to show us that we could not get to Mrs. Acton Tindal's at this visit, and must, all well, make another chapter of that in weeks to come. When we had done Mr. Fowler's poultry establishment, and seen all the waterfowl, we had a hasty peep at the cattle and the steam ploughs and such like, and then it was time to go. We only had to walk down the gardens to find ourselves on the platform of the station, and so with a glorious blush rose bud as a souvenir, picked from that charming old-fashioned garden, and with the pleasantest recollections of the Willow Bank hospitality, we, for the time, bade adieu to Aylesbury.—W.

### CATALOGUES.

I READ with pleasure your contributor "W." notes on catalogues at shows. Exhibitors may well resent what seems such indifference to their just claims, and the more when the remedy is so easy. If secretaries would keep on hand a stock of stamped wrappers, and as they transcribe the entries from the usual form into their books, also write the exhibitor's name and address on one of them, then file them, and when the catalogues are ready hand a sufficient number of them along with the ready-addressed wrappers to a boy, plenty of whom are usually to be found at hand on such occasions, telling him at the same time to post them when finished, the transaction is done.

But with regard to the A and B entries I cannot agree with "W." Such classing does not show that entries have been

carelessly kept, but it does show that they have been taken after date. This is much more generally the fault of exhibitors than secretaries, and these last have good cause of complaint. As an example I may mention that at our local show, of which I am secretary, the entries at the date of closing amounted to 170; two days after I had received nearly 880 more. The amount of extra labour thus entailed by the whole work having to be done in such a short space of time any secretary has a right to complain of, as it is impossible it can make any difference to an exhibitor entering three or four days sooner. But secretaries are at the mercy of exhibitors, as it is easy to say, "Stick to your date," but then what sort of a show have you? The fact is, if the secretary has the matter at heart he must take them, and when this is the case it is all the harder that his love of the fancy should be the loophole by which his brother fanciers take advantage of him.—J. E. BRUNNEN, *Broughton Ferry*.

### MORE NOTES ON THE BIRMINGHAM SUMMER SHOW.

IN the beautiful grounds of Aston Park we found the Summer Show this year. Such a glorious Eden after last time. We look back with terror at St. James's Hall, bristling with scaffolding poles, smelling of paint, and varnish, and glue, as it did last September when the Summer Show was there. We must congratulate Mr. Watts on his trying place this season, and on the "quality" he gathered together. He and his attendants were as civil and courteous as ever; just as last time their show was conspicuous for the kindness and courtesy all exhibitors received. There was, however, one drawback, and that a serious one—we could not find out when we were there on the first day who won the cups and extras, and so this hour we are perfectly in the dark as to who are the happy owners of the "silver-plated tea services." It was a mistake not adding these awards in the list of prizes.

We found the *Dorkings* splendid classes, and the quality much superior to last year. The winning cockerels were fine, and deserved their places. Messrs. Burnell and Beachy will, we fancy, be strong exhibitors this year. The winning Coloured pullet was a well-matured bird. The second we did not care for; she was rather poor in colour, and had not the best of toes. The third (Darby) was much superior, being of splendid colour, and when more matured will make a rattling bird. 19 (Beachy) a splendid pullet, but a shade faulty in feet. The Silver-Greys and Whites were good. Mr. Stratford's third cockerel we thought especially promising. We were glad to see the Silver-Greys, too, so looking-up and of such promise.

*Cochins* were beautiful, and with the exception of the Blacks made large classes. The first Buff cockerel was a beauty, sound in colour and very promising in shape. We believe he was bred at Stone Park, and is one of Mr. Wragg's young wonders. The second was a beauty, good all round. In pullets the winners were all good, but, with care, we back the third (Darby) to beat the lot. We never remember greater promise in a pullet of that age, and we believe in this opinion Mr. Fenton, one of the best Cochins judges in the world, backs us up. The Blacks were not superior, except the first-prize pens, and they were the second-prize pen at Preston we believe; if so, one must there have had black legs and one yellow. Partridge were good classes. It must have been a close shave between the first and second cockerels. The Whites, too, were a fine lot, especially the pullets, but they did not come up to the winning Whites of last year.

Dark *Brabmas* were disappointing. We looked in vain for the symmetrical giants of last season. Wherever is Mr. Lingwood? or is rumour right when we hear that many of the winning chickens so far have come from Creeting? The *Lights* were grand—bird after bird worthy of a prize. It is truly marvellous to see to what a pitch of excellence this handsome breed has been brought. Mr. Dean was evidently up right early this year, and secured the early worms. All the winning cockerels were good and well placed. We dare not individualise the pullets, they were all so good; perhaps we liked three or four as well as the winner, but we would not have judged them for anything, for so many were so even.

*Spaniels* were very fine. We refused to see this aristocratic breed mustering so well, in quality especially. Old birds won the first prizes, and hence the cup. 298 (Belden) seemed worthy of a place, though we should not have had the heart to leave 307 (Allcock) out in the cold.

The *Game* were small classes, and did not come up to last year's show at St. James's Hall. Most of the birds were backward, the cockerels especially, but there is plenty of time for them yet before the two Palaces hold their "at homes."

*Hamburghs* were again badly represented. We could not understand it; only about twenty pens for nearly as many pounds' worth of prizes. We confess we do not understand the *Hamburgh* exhibitors, for there would have been as much competition at a village show in Lancashire for 20s. as there was here for close on £20.

*Polands* were good; but, Mr. Watts, "where, and oh where, is the other class gone"—those poor White-crested creatures? But their owners deserve it.

*Houdans* two capital classes. Did we see some feathers on the winning cockerel's legs, or was it fancy? The second a beauty, and the pullets all good and well placed. 896 (Morris) a splendid fellow.

*Créves* were small classes, and what there was we did not think much of.

The Variety classes were small, but the winning birds good. Malays were first in both classes, and then White and Brown Leghorns seemed to have tossed for the other prizes. We are glad Mr. Kitchen has at last landed his speciality.

*Bantams* were good; in fact, very good. The Piles were beautiful. The Sebrights, too, mustered quite smartly. Mr. Leno won the cruet stand, and we hope it was a good one. A drop of oil is often useful to all of us, but perhaps there is as little used at Dunstable as there is anywhere. Black Bantams were splendid. Mr. Beldon's cockerel was a regular little beauty. In the next class Pekins and White-boots divided the booty.

*Ducks* were good; but Mr. Sainsbury must not be left alone in his glory any more; still we are certain we shall never see these classes well filled till the size is less thought of than colour.

The adult birds were a good lot, but many left a great many feathers behind in Aston Park, so rapidly were many falling into moult. Mr. Darby's winning Coloured Dorkings were very grand, his winning hen a "Martini" all over. The Cochins and other adults were for the most part birds which we have commented on for months back, and the names of their owners almost can tell us the names of the individual birds. Silkies had a class; the first went to beautiful chickens, and second to a good pen of Mr. Woodgate's, but they had become dirty in their pen; third were fair birds, but we liked another pen or two quite as well. Black Hamburgs were honoured with two adult classes, while the other Hamburgs had not even one. We could not understand it, and the honour seemed to have been too great for the birds themselves, as only eight pens appeared to try for six prizes value £5 10s. We are more and more amazed at the Hamburg exhibitors.

### LEICESTER EXHIBITION OF POULTRY, &c.

This year's Show, August 24th and 25th, was carried out with the same amount of care and personal supervision that has always been noted at the previous meetings. The fact is, nothing could be wished for better than the arrangements within the tent, which gave plenty of space for visitors, with the most ample accommodation for a fit display of the birds exhibited, and as the show days were very fine and summer-like the attendance of visitors proved most satisfactory.

The Grey Dorkings were mostly in very indifferent feather, and though the prize birds were excellent, the less we say of the remainder the better. *Spanish*, though deep in moult were very good, although it appears to us not good policy to exhibit valuable stock whilst under such heavy change of plumage, as it retards the moult considerably. The whole of the *Cochins*, as usual at the Leicester shows, were unquestionably good, a grand pen of Mr. Tomlinson's Bufts coming well to the fore in adults, and Mr. Charles Sedgwick of Keighley returned the compliment under severe competition in the Buft chicken class. In White Cochins Mr. Tomlinson managed to secure both prizes with a couple of admirable pens in the adult class, and was also first for White chickens. Partridge Cochins took first in the Any other variety Cochins class, and unusually good Blacks had the second place; and again, in the chicken class the colours stood in the same order. The Light *Brahmas* were beyond question preferable to the Dark-feathered class, and some of the youngsters of this breed forcibly reminded us of the most palmy days of the late Mrs. Williamson, who enjoyed a world-wide reputation for her strain of Light *Brahmas*. Good *Game* fowls, but mostly moulting, was the order of the day; but in the Variety class a pen of Black Red pullets, and another of Brown Reds, were shown in the most unexceptionable feather. *Hamburgs* were few and praiseworthy, and we should do wrongly by omitting favourable mention of a pen of *White Bantams*, both good and very small. *Geese*, *Ducks*, and *Turkeys* were grand classes, and though the *Pigeon* classes were not large, the quality of most of them was equal to the best of shows. The *Rabbits* were about the best collection yet seen at Leicester.

**DORKINGS**.—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, W. H. Crabtree, Levenshulme. 3, S. W. Hallam, Whitwick, Leicester; Miss M. Murray, Thilstone, Derby. *Chickens*.—1, Miss M. Murray. 2, W. H. Crews, Etwall, Derby.

**SPANISH**.—1, S. W. Hallam. 2, J. Gunn, Coalville, Leicester. 3, M. Brown, Ab-Ketley.

**COCHINS**.—*Cinnamon and Buff*.—1, H. Tomlinson, Birmingham. 2, T. Rogers, Crouch End, London. *Chickens*.—1, C. Sidgwick, Keighley. 2, W. H. Crews, 6, H. Tomlinson.

**COCHINS**.—*White*.—1, W. Whitworth, jun., Longsight, Manchester. 2, H. Tomlinson. *Chickens*.—1, H. Tomlinson. 2, W. Whitworth, jun.

**COCHINS**.—*Any other variety*.—1, J. Gunn, Coalville, Leicester. 2, W. Whitworth, jun. 3, T. Rogers. *Chickens*.—1, C. Sidgwick. 2, W. Whitworth, jun.

**BANTAMS**.—1, W. H. Crabtree. 2, J. Gunn. *Chickens*.—1, W. J. Ford,

Humberstone. 2, J. T. Hinks, Humberstone, Leicester. 3, Rev. R. L. Story, Derby; Dr. J. Holmes, Whiteootes, Chesterfield; W. H. Crabtree. 4, H. Draycott, Leicester.

**GAME**.—1, S. W. Hallam, Whitwick, Leicester. 2, E. Winwood, Worcester. 3, 1 and 2, W. T. Everard, Ashby-de-la-Zouch. *Chickens*.—1 and 2, T. B. Lowe, Leicester. 3, A. C. Barclay, Leicester; W. T. Everard.

**PARTRIDGE**.—*Golden or Silver-spangled*.—1, S. W. Hallam. 2, J. Ward. 3, W. H. Crabtree. 4, J. M. Mayo, Gloucester. 5, W. Griffin, Leicester. *Clean-legged, any other variety*.—1, H. Draycott. 2, Withheld.

**SELLING CLASS**.—*Cock or Cockerel*.—1, T. Rogers (Buff Cockerel). 2, J. E. Pilgrim, Hinkley (Houdan). 3, J. H. Watkins; J. T. Hinks; M. Brown. 4, H. H. Watkins. 5, H. Yardley, Birmingham (Partridge Cockerel). 6, A. C. Barclay (Brown Red Game). 7, W. S. Black, Melton Mowbray. 8, H. Draycott. 9, M. Foxwell, Hinkley; M. Brown. 10, T. Sheppard, Humberstone, Leicester.

**DUCKS**.—*Aylesbury*.—1, Mrs. Deacon, Oundle. 2, T. Bear, Aylesbury. 3, W. H. Crews; W. Snell, Barrowden, Stamford; H. E. Emberlin, Oadby, Leicester. 4, W. Whitworth, jun. 5, R. & H. Gill, Holwell, Melton Mowbray; W. T. Everard. 6, *Any other variety*.—1, H. Yardley (Caroline). 2, T. Rogers. 3, W. Wykes, Wolvey, Hinkley. 4, W. H. Johnson, Braunston, Leicester (3).

**GESE**.—1, W. Snell, Barrowden, Stamford. 2, W. H. Crews.

### PIGEONS.

**CARRIERS**.—1, H. Yardley. 2, W. Nottage, Northampton. 3, C. Bream, jun., Leicester.

**POUTERS**.—1, H. Pratt, Hampton-in-Arden, Birmingham. 2, W. Nottage. 3, H. Yardley.

**FANTAILS**.—1, H. Yardley. 2, J. F. Loversidge, Newark. 3, J. Walker, H. E. Emberlin.

**ANY OTHER VARIETY**.—1, H. Yardley. 2, H. Jacob, Humberstone, Leicester. 3, A. H. Wayne, Humberstone, Leicester. 4, H. Jacob. 5, H. T. Hinks, Humberstone, Leicester.

**ANY OTHER VARIETY**.—1, H. Yardley (New variety). 2, H. Draycott (Red Swallows). 3, extra and 4, J. H. Inckley, Mountsorrel (Fire Pigeons and Yellow Fairies). 5, H. Yardley (Black Barbs); W. Gamble, Thorpe Satchville, Melton Mowbray (Black Trumpeters). 6, J. H. Inckley (Frisillae); C. Bream, jun., Leicester (Red Mottled Tumblers); W. Nottage (Blue Foremen). 7, H. Yardley (Red Barbs). 8, R. & H. Gill; W. Matlock, Smeaton, Kibworth, Leicester.

### RABBITS.

**LOP-EARED**.—1, Mrs. H. Pickworth, Moulton Marsh, Spalding. 2, T. B. Barrow, Leicester. 3, W. Green, Normanton-le-Heath.

**STANDARD**.—1, H. Yardley. 2, H. Jacob, Humberstone, Leicester. 3, J. H. Inckley, Hinkley (Grey Patagonian); G. Crossley, Leicester (Himalayas); J. E. Pilgrim, Hinkley (Grey Patagonian); G. Crossley, Leicester (Himalayas); J. E. Pilgrim, Hinkley (Hare Rabbit); Mrs. H. Pickworth, Moulton Marsh, Spalding (Grey Dutch).

**JUDGES**.—Mr. Edward Hewitt, Sparkbrook, Birmingham.

### PENNISTONE SHOW OF POULTRY, &c.

The twenty-second annual Show was held at Pennistone on the 26th of August. There were forty classes for poultry, Pigeons, and Rabbits, with 233 entries. Turner's pens were used, the day very fine, and the number of visitors very great. Poultry were divided into old and young classes, the quality in many being only moderate, while in others it was very good indeed. In the large varieties this remark applying most particularly to Cochins in both classes, the first in Buft chickens an especially grand pair.

*Brahmas* were only moderate, but the *Hamburgs* were pretty good throughout, the old Gold-spangled and Pencil in the first-price pens being two of the champion pens of the season; the Silver-pencil chickens also a most noteworthy pen. The first in old Red *Game* were very good and in moderate feather, and Messrs. Mason's Duckwings most perfect in colour; the first in chickens of this variety uncommonly good. As may be seen from the names of the winners the Piles were very good and well placed. In both old and young birds the first in both classes were full of style. In old *Game Bantams* there were but few good pens; the winners were Black Reds. In the Variety class Blacks were first and Gold-laced second, capital Silver Sebrights being highly commended. *Ducks* were very first rate in every section, the Variety class being particularly interesting.

*Pigeons* but one class, and that for the best three pairs, the first going to Carriers, Pouters, and Archangels, and second to Carriers, Pouters, and Trumpeters.

*Rabbits* were poor, except the Himalayan shown by Mr. Hallas.

**DORKINGS**.—1, J. Walker, Rochdale. 2, W. Harvey, Sheffield. *Chickens*.—1, J. Walker. 2, Burch & Boulter, Sheffield. 3, H. Digby, Acres Lindley, Burnfield.

**SPANISH**.—Black. 1, Burch & Boulter. 2, W. Harvey. *Chickens*.—1, Burch and Boulter. 2, H. Wilkinson, Kirby, Leeds.

**COCHIN-CHINA**.—1, C. Sidgwick, Keighley. 2, J. North, Fartown, Huddersfield. *Chickens*.—1, C. Sidgwick. 2, C. Carr, Wilsden, Bingley. 3, J. Denton, Pitamoor, Sheffield.

**BANTAMS**.—1, W. Harvey. 2, Moore & Cartwright, Hollowgate, Holmfirth. 3, North. *Chickens*.—1, J. Healey, Hopworth. 2, H. Digby. 3, W. McMillon, Glossop; E. Digby, W. Harvey.

**HOUDANS**.—1, G. W. Hibbert, Godley. *Chickens*.—1 and 2, G. W. Hibbert.

**PARTRIDGE**.—*Golden*.—1, T. Dean, Keighley. 2, Moore & Cartwright. 3, Broadhead & Booth, Holmfirth. *Chickens*.—1, S. Arnold, Huddersfield. 2, Broadhead & Booth. 3, Moore & Cartwright; Burch & Boulter; W. Bentley, Bird Edding, Holmfirth.

**PARTRIDGE**.—*Any other variety*.—1, W. McMillon. 2, Broadhead & Booth. 3, Holmfirth. *Chickens*.—1, W. McMillon. 2, Broadhead & Booth. 3, Moore & Cartwright.

**HAMBURG**.—*Golden-pencilled*.—1, W. Driver, Keighley. 2, J. A. Brook, Holmfirth. 3, H. Digby. *Chickens*.—1, W. Bentley. 2, W. Driver.

**HAMBURG**.—*Silver-pencilled*.—*Chickens*.—1, H. Smith, Keighley. 2, H. Digby.

**GAME**.—*Black-breasted and other Reds*.—1, A. S. Sugden, Swinley, Cleckheaton. 2, C. Travis, Thurgoland, 3, J. Denton. *Chickens*.—1 and 2, B. Burton, Thurgoland Bank. 3, T. Johnson, Ecclefield.

**GAME**.—*Duckwings and other Greys and Blues*.—1, H. C. & W. J. Mason, Birstal, Leeds. 2, W. Marsh, Nook. *Chickens*.—1, B. Burton. 2, T. Johnson, Ecclefield. 3, B. Burton. 4, T. Johnson.

**GAME**.—*Whites and Piles*.—1, H. C. & W. J. Mason. 2, R. Walker, Gomersal, Leeds. 3, H. C. & W. J. Mason; Moore & Cartwright; R. Walker. *Chickens*.—1 and 2, R. Walker. 3, H. C. & W. J. Mason.

**ANY OTHER VARIETY.**—1, G. W. Hilbert, Godley, Manchester. 2, W. Bentley, A. & W. H. Silvester, Shadfield. 3, G. W. Hilbert; T. Deas, Kighley; A. and W. H. Silvester. **CHICKENS.**—1, S. Arnold, Raddesfield (Black Hamburg); 2, G. W. Hilbert; 3, C. Stigwick. **AS.** G. W. Hilbert; W. Wood, Wakefield; 4, R. Norton, Royland Common (Blue Seaside); 5, W. Bentley, A. & W. H. Silvester. **J. Thornley, L. Anglands, Godley.** 2, C. H. Digby (B). **BANTAMS.**—Game—1 and 2, A. & S. Sugden, Swinley, Clackhoughton. 3, J. A. Brock, Holmforth. *Any other variety.*—1, Sarah & Boulton. 2, J. Simpson, Worsley. 3, A. & W. H. Silvester; J. North. **POULTRY.**—1, J. Walker. 2, J. Pearson, Snowden Hill. **COCHINS.**—1, G. Jackson, Inghamworth. 2, T. Crawshaw, Hunschoff. 3, J. Brooks. **DOCKINGS.**—White *Spanglers*.—1, J. Walker. 2, J. Denton. 3, J. Denton; J. North. 4, C. H. Digby. *Spanglers*.—1, J. Walker. 2, G. H. Hirst, Northam Mills. *Any other variety.*—1 and 2, A. & W. H. Silvester. 3, J. Walker. **SPANGLED.**—White *Spanglers*.—1, T. J. Crockett, Doncaster. 2, H. Digby. **FIGURES.**—1 and 2, H. Harvey. 3, J. H. Sykes, Raddesfield. **HAMPSHIRE.**—*Long-necked.*—1, H. Worsley, Rotherham. 2, J. White, Highgate, Derby. *Any other variety.*—1, J. H. Halla, Huddersfield. 2, H. Digby. 3, J. H. Halla. 4, J. H. Halla, Huddersfield. **JURORS.**—Mr. W. Cannon, Adolphus Works, Bradford; Mr. J. Dixon, North Park, Bradford.

### SKIPTON SHOW OF POULTRY, &c.

The Craven Agricultural Meeting took place on the 27th of August, when the day was such as the Society has not enjoyed for many years. The pens used for poultry are substantial wooden ones, which are sadly too small for the large varieties, the greatest disadvantage, however, being that open both back and front, causing a strong draught, by which many young birds catch cold. The classes were divided into old and young, and in the young division the entries were good.

**Dorkings** headed the list with one pen. *Spanish* four, in which we would have put the second first, and Mr. Thresh (highly commended) second, though the first-prize pen had the best hen in the class the cock was quite down. In *Red Game* Brown Reds won, but they were mealy out of feather; and in the Variety first were Piles and second Duckwings. Of *Cochins* two pens, and both Buffs. *Gold-pencils* good for the time of year, and *Silver-pencils* in the finest order. In *Silver-spangles* the cup was awarded; but the hen having a broken tail, and the hen not so good as the second, these might have been reversed. *Gold-spangles* a grand lot, as good in fact as we have ever seen together, and well placed. *Black Hamburgs*—first good and second moderate. *Polands*—first *Silver* and second *Gold*, and the cup awarded to the first-named pen. *Game Bantams* were out of feather; the winners *Black Reds*. *Bantams* of Any other colour being all *Black*, and a good class. In the Variety class *Brahmas* won, a splendid pen of *La Fitch* highly commended.

In young poultry the *Dorkings* were good, and *Spanish* even better, but here we would have placed Mr. Powell's highly commended pen first, and the first-prize pen second. In *Red Game* were some promising chickens but not forward, and the pens being small they did not show well. In the Variety class first and cup for *Game* were *Piles*, and second also *Piles*, not quite as old as the first. In *Cochins* first were *Partridge* and second *Buffs*, both good pens. The first-prize *Golden pencil* pullet was a gem, and will no doubt be heard of again. *Silver-pencilled* very good, the *Silver-spangles* being also a moderate lot. *Black Hamburgs* not forward, but full of colour and neat, as *Hamburgs* should be. In *Polands* the winners *Golden*. *Game Bantams* were a good lot; the first *Piles* were very gamey-looking, and hard pressed by the second-prize *Reds*. *Black Bantams* were moderate in quality, and in the Variety class first were *Dark* and second *Light Brahmas*, a very good pen of *Red Malays* highly commended. *Geese* only one pen, and *Aylesbury Ducks* two, these very good, although the *Rouens* were even better.

In *Pigeons* the *Carriers* were well placed in both cocks and hens, as also the *Pouter* cocks; but in hens the second-prize *White* had a lame wing, Mr. Hornor's *Red* being a superior bird. *Almonds* were not well placed, the second being best in all respects, the first too light, and hen had a bad eye, and we would have placed pen 544 second; and in *Owls* pen 552 were by far the best in the class (Harrison), while the first were fairly entitled to second, though showing a touch of *Foreign*. *Barbs*—first good and rightly placed, but the second should have gone to pen 555 (Yardley), *Yellows*; the second-prize hen being almost dead could not carry her wings. *Jacobins* very good, and well placed; the first *Reds* very good in hood and chain. *Mottle Tumblers*—first *Yellow Short-faces*, and second *Red Long-faces*. *Beldpates* were first *Black Long-faces*, and second *Blue Short*, and well placed also. *Fantails* a good class, but *Dragons* poor, except the first *Blues*, which were young birds. In *Long-faced Antwerps* the best as *Antwerps* were Mr. Lister's *Red-chequers*, but these were no doubt left out as too short, the winners being much longer. In *Short-faces* the best were left out altogether. Pen 698 (Harrison) should have been first, and the first should have been second. In the Variety the first were *Red Turbits*, and second *Red Magpies*.

**DOCKINGS.**—1, J. Walker, Rochdale. **SPANGLED.**—*Black*.—1 and 2, H. Belden, Golestock, Kighley. 3, J. Thresh, Bradford; 4, W. Wilkins, Ebury. **GAME.**—*Black-breasted and other Reds*.—1, A. & S. Sugden, Swinley, Clackhoughton. 2, E. Lund, Gouthwaite, Ollingworth. 3, H. Fortuna, Kighley.

**Duckwings** or any other variety. 1, E. Walker, Golestock. 2, W. Spencer, Harworth. 3, H. Wilson, Crookham, Kighley. **COCHINS.**—*Golden-pencilled*.—1, J. Walker. 2, C. Stigwick, Kighley. **HAMPSHIRE.**—*Golden-pencilled*.—1 and 2, H. Belden. 3, J. Robinson, Garstang. 4, W. Clayton, Hawtholme, Kighley. **HAMPSHIRE ON CRITTEPAT.**—*Silver-pencilled*.—1 and 2, H. Belden. 3, J. Robinson. **HAMPSHIRE.**—*Golden-spangled*.—1 and 2, H. Belden. 3, T. Deas, Kighley. *Silver-spangled*.—Cup and 1, J. Robinson. 2, H. Belden. **HAMPSHIRE.**—*Black*.—1 and 2, H. Belden. **POULDS.**—Cup and 1, H. Belden. **BANTAMS.**—*Game*.—1, A. & S. Sugden, Swinley, Clackhoughton. 2, A. Smith, Northowram, Halifax. *Any variety*.—1 and 2, H. Belden. 3, H. Belden. 4, H. Belden. 5, W. H. Robinson, Kighley. **ANY OTHER VARIETY.**—1, H. Wilkins, Ebury. 2, T. Fye, Lancaster. 3, H. Belden, Ebury. 4, F. Walton, Ebury.

### YOUNG POULTRY.

Brown, Ebury. **TUMBLERS.**—1, J. Walker. 2, T. Brides, Skipton.

### FIGURES.

### BRECON SHOW OF POULTRY, &c.

The first annual Show was held at Brecon in the Market House on the 25th ult. Billett's pens were used and well arranged; those for the Cats, with red cushions and sand, looked very neat. For a first attempt the entries were very good. There was an excellent Committee, this department being under the special management of W. W. Ounick, Esq.

**Dorkings** headed the list with three good pens; the *Cochins* though good were shabby. *Brahma Pootras*, *Dark*, were good, but out of feather; the *Lights* being better. In *Hamburgs* *Gold-pencils* and *Spangles* were very good; the first *Spangled*, and second and third *Pencilled*. The first in *Silvers* also being a well-known pen of *Spangles*, and second and third *Pencils*. The first in *Polands* were *Silvers*, very first-rate; second fair *Blacks*, but the others poor. In *Game*, *Reds*, the birds were very good in style and quality, but mostly out of feather, though the first *Black Reds* were in fair trim; *Brown Reds* were second. *Duckwings* had three pens, good, but out of feather. *Whites* and *Piles* were but moderate; the first *Pile*, and second *White*, a fair pen for this colour. In *French* first and third were *Oréves*, and second *Houdans*; the first a real grand pair. The variety was one of the best classes in the Show, and two firsts were awarded to *Malays* and *Black Hamburgs*, second to *White Malays*, and third to *Sultans*. *Bantams*, *Game*, were in bad feather in both classes; but in the Variety the birds were in splendid form, first *Gold*, and second and third *Silver* *Sabbrights*. In cockerel and pullet of the larger varieties *Light Brahmas* were first and *Dark* second. The class for other varieties of chickens, first were *Silver-spangles* of rare quality, second good forward *Spanish*, third *Brown Red Game*, and extra third *Gold-pencils*, a capital pen of *Black Reds* being also very highly commended. The winners in *Rouen Ducks* were uncommonly good as far as regards the winners, but many of the others, though very good in other points, were bad in bill. In the Variety class *White* and *Brown* *Decoys* won the prizes. In *Geese* first were *Toulouse*, and second *White Embden*, both pens large and in fine order, while some good pens were also noticed. In the *Selling* class for poultry there was nothing of note; but *Ducks* were very good and cheap, and the winners *Rouen* and *Aylesbury*.

The one class for *Canaries* had thirteen entries; first a Cinnamon Norwich, second Variegated Norwich, and third a Clear Buff Yorkshire; altogether a good class.

There were eleven classes for *Pigeons*; first in Carriers was a grand Black, with very good eye and beak-wattle; second a Black cock, good in beak, but not equal in eye; highly commended a Dun hen, a nice bird in all respects, but too light to win here. In Pouters first was Blue and second White, both cocks of fair quality. In Short-faced Tumblers first was a good all-round Almond; second a Kite, unusually good in head; and very highly commended an Almond and Red Agate. Jacobins poor except the first, a Red. Fantails a large class, the winners White, and good alike in carriage and tail, there being also a good Blue and a Silver. Nuns were Black and well shown, clear and correct in marking. Barbs, Black, the first good in head, second rather long in face but well developed in eye. Antwerps poor except the first-prize Short-faced Red Ohequer cock. In Owls and Turbits first was a very small White Owl, second a Red Turbit, and very highly commended a good Blue Turbit. For the best of any other variety first was awarded to a pair of Blondinettes, and second to a Black Magpie.

There were four classes for *Cats*, but the classification of these is not at all understood in this quarter, for in the class for Tortoiseshells every entry was Tortoiseshell-and-white, a good lot, however, and in consequence the prizes were awarded. In that for Tabbies Mr. Baxter's Lion was first; second a handsome Silver-Grey Tabby; and third a dark one. Many very large and good animals were left out, as they were marked with white. Long-haired Cats had a class; a very good White one was first, and Yellow Tabby second, and a moderate White third. In the Variety there was not a good one.

**DORKINGS**.—1, Mrs. E. Williams. 2, H. Feast. **COCHIN-CHINAS**.—1, Mrs. Davies, Talybot. 2, J. G. Holford, Buckland, Brecon.

**BRAMA POUTERS**.—Dark.—1, W. Morris, Ross. 2, H. Feast. 3, J. Ferris, Brecon. Light.—1, T. A. Dean, Marden. 2, H. Feast. 3, Mrs. H. J. Bailey, Rosedale, Tenbury. Ac. Rev. H. Williams, Brecon.

**ANY OTHER VARIETY**.—1, W. Lloyd, Hay. 2, Mrs. G. Jones, Brecon. 3, E. Hill, Brecon.

**JUDGES**.—Mr. E. Hutton, Pudsey, Leeds.

#### HALIFAX SHOW OF POULTRY, &c.

THE Halifax and Calder-vale (which is one of the leading Societies of the West Riding) held its annual meeting on the 28th of August in the Craven Lodge grounds, which are well suited for the purpose, although at a distance from the town. The poultry and Pigeons were exhibited in Turner's pens and in the open field, and well arranged for seeing. A great change had been made in the schedule, the whole being for young birds in poultry; and for a show of this character the entries were very fair, 145 pens; but though the prizes were very good in Pigeons, the entries were not good, 97 pens only, but the quality was most select, as will be seen by the list.

Neither the cockerels nor pullets were of any note in Black Red Game, but the Brown Reds were better, the cockerels a good lot, though rather late. In both cases the prizes were awarded to birds prematurely dubbed, a thing that in our opinion ought to be discountenanced, for as good a Game cock can be found under a comb as can be found minus that ornament. In pullets, Brown Reds, the first bird, Wright's, was by far the best, but may have been passed over on account of the trimming, which is at any time objectionable on the face of a Game hen. Piles were very good in both the classes, as also Duckwings, the first cockerel being a grand fellow. *Spanish* were good, and placed as at Skipton; while *Dorkings* were reversed from the previous day's decision, proving, as we have often asserted, that among the first three or four pens at any show a decision may be reversed without the least inconsistency. In *Cochins* there were none good except the winners; the first Partridge and second Buff, the cup for best pen in the Show being awarded here. *Brahmas* were bad if we except the winners, which were pretty good. In *Hamburghs* the entries were very poor—only one pen of Gold-spangles, two of Silvers, and two of Golden-pencilled, while in Silver-pencils there were six of good quality. The best pen in Black *Hamburghs* was left out—viz., the pen first at Skipton the day before, while a pen commended there was placed first. In Red Game *Bantams* first were Black, and second Brown Reds, and correctly placed; Piles and Duckwings winning in the next class. Black *Bantams* moderate.

*Geese* good, first White and second Toulouse. *Rouen Ducks* were better placed than at Skipton, the right pen falling in for first. The Variety class in Ducks was very good; but the Selling class poor.

In *Pigeons* we are reluctantly compelled to differ very materially with many of the awards, but justice to the exhibitors compels us to waive all feeling on the subject, as it would be utterly impossible to defend them on any principle whatever. In Pouter cocks first was a Blue that might have been placed second, being thick in girth and bad in colour; the second being a poor White, bare on shins; while the best, a Blue, in fine feather and show, and grand in colour, was only highly commended, pen 638 (Fulton). In hens also pen 643 (also Fulton) was the bird of our choice; the second Red, a smart hen, was rightly placed. In Carrier cocks, however, the greatest error occurred. Pen 647 (Fulton) was a Black, which was the bird for the cup without a second look, grand in beak and eye wattle, only highly commended; the first and cup for best pen going to a Dun cock, a good bird, entitled to second; while the second was given to a Black, once good, but with a stiff wing. Pen 648, a young Black, was wonderful in head properties, but a little thick in body. In hens the best was also left out, a Black of more than common merit, large in eye and beak wattle; the first going to a good Dun, which might have been second; the second-prize winner was a Black, uncommonly good in beak, but young as compared with the others. Highly commended pen 655 (Yardley) a capital Black. Almond Tumblers rightly placed, and most extraordinary in head properties. Tumblers any other, first Yellow Mottles, rather coarse; second Black Mottles, smaller and better. *Dragoons* good and well placed; first Blue and second Silvers. Trumpeters, two pens, might have been reversed; first were Mottles and second Blacks. Foreign Owls both White and well placed; but in Turbits the best were pen 687 (Stephenson), Blues, highly commended; the first Reds were bad in crown; while the second Yellows were rightly placed. In Jacobins the first were Reds, splendid in hood and chain; the second Reds very poor and spindly; the same exhibitor's highly commended birds being better; while the second best were pen 693, Yellows, and not noticed. Fantails were good and well judged. Barbs all Blacks, very good; pen 702 containing a young cock of rare merit. Magpies, first Reds and second Yellows, and very good. Antwerps, first Short-faced Duns, very good; pen 711 were second best; but second was awarded to a pair in which the cock had a yellow, and hen a pearl eye, a poor pair indeed. In the Variety class was the most beautiful pair of what we will term Tortoiseshell Frill-

**CARRIAGES**.—1 and 2, J. Hainsdale, 2 and 3, J. Hodgson, Driffield.  
**TURKISH**.—1, E. A. Thornton, Hull; 2, G. W. Lythe, Cottingham; 3, T. E. Stephenson, As, J. Hainsdale.  
**ANTWERPS**.—1 and 2, R. Smith, Hull; 3, J. Hainsdale.  
**JACOBIUS**.—1, T. P. Carver, 2, — Sylvester, 3 and 4, J. Hainsdale.  
**FANTAILS**.—1, J. Walker, Newark; 2, T. E. Stephenson, 3, J. Hainsdale, As, J. Hainsdale; 4, J. Walker; 5, J. F. Lovelidge.  
**DRAGOONS**.—1, E. Woods, Mansfield; 2 and 3, J. Hainsdale, As, J. Payne, Beverley.  
**TURKISH**.—1, A. & W. H. Sylvester, 2, W. & E. Adams, Beverley; 3, J. Hainsdale, As, J. Hainsdale, W. & E. Adams.  
**MAINE**.—1 and 2, O. Wood, Hull; 3, J. Hainsdale, As, J. Hainsdale; 4, A. W. H. Sylvester.  
**MINE**.—1, T. E. Stephenson, 2 and 3, J. Hainsdale.  
**OWLS**.—1, T. E. Stephenson, 2 and 3, J. Hainsdale, As, J. Hainsdale; 4, E. A. Thornton (3).  
**BALLING CLASS**.—1, Mrs. Stabler, 2, A. & W. H. Sylvester, 3, C. N. Lythe.  
**RABBITS**.  
**LONG-EARED**.—1 and 2, T. & E. J. Fell, Blackburn; 3, A. Robson, Northampton. Also, J. Hainsdale, Huddersfield; As, Mrs. H. Pickworth, Scadding; T. Myton, York; C. R. Merritt, Beverley; W. M. Clark, Hull; R. Harrison, Hull; G. Conyers, Hull.  
**SILVER-GREY**.—1 and 2, J. Hainsdale, 3, G. Conyers; J. Ashley, Hull. As, A. Cony, Barton; 4, G. Conyers; T. Myton.  
**SHIRAZIAN**.—1, J. Hainsdale, 2, A. W. Whitehouse, Northampton; 3, T. Myton; J. Hainsdale, 4, G. Conyers, 5, C. O. Mason, Rochdale.  
**BALLING CLASS**.—1, T. Myton, 2, J. Blakey, Driffield; 3, J. Wharton, Hull; 4, J. Ashley; — Graeven, Cleethorpe (3); As, J. Hainsdale, 5, J. Ashley; J. Hainsdale.  
**ANY OTHER VARIETY**.—1, Mrs. Pickworth; — Graeven, 2, W. Donkin, Driffield; J. Hainsdale, 3, J. Ashley, 4, T. R. Topham, Driffield; — Graeven; J. Hainsdale, As, T. & J. E. Fell.  
**JUDGES**.—Poultry: Mr. Cannan, Bradford; Mr. Ferguson, Beverley. Pigeons: Mr. Newbitt, Epworth. Rabbits: Mr. A. Hudson, Paragon Street, Hull.

### BURY POULTRY SHOW.

As usual this Society issued a good schedule, but the classes were mostly for chickens. In *Spanish* cockerels first was a very promising bird, pressed by two or three others of good merit. In pullets first was a very good bird well developed. In Buff *Cochins* Mr. Bidgwick had all his own way with well-known birds, but in Partridge he was hard pressed. First cockerel, a fine, big, rich bird; second also very good, but hooked. The first pullet we did not like, her colour being bad; second very good. Very highly commended was a capital Black indeed. In Dark *Brahmas* the two cockerels were the well-known champions of Mr. Ansdell, second being the first Birmingham; Mr. W. A. Wright's having a bad comb. In pullets we did not like the winner, which was the same we have before noticed—not well pencilled, and open in breast; we prefer the second. In Light *Cochins* first was a thick well-made bird, good in feather and comb; second not good in comb; highly commended a fine bird which we preferred to second. In pullets first was a very good one, second fair in size and colour, highly commended (Long) smaller but very neat. In *Games* the first old bird was a very rich fellow of capital style. Mr. Fletcher's was our selection for second. In cockerels one pen only appeared, the first pullet was good. In other colours the judging was much at fault, the second being infinitely preferable to first in both cases. *Polands* did not show well: the cockerels were not good; pullets better, both being nice birds. In *Golden-spangled Hamburgs* the first cockerel was not a good colour, second decidedly better to our mind. In pullets also we preferred the second to the first. In *Silvers* both winners were smart and well marked. The first pullet was a beauty, second fair. In *Gold-pencils* first and second were both good birds. In *Pencils* pullets both winners were nice birds. In *Silvers* the first in both classes were excellent indeed; the second cockerel a bad colour. The first Black cockerel was very neat, second fair. Pullets were a nice class, the first being especially nice in bloom. In *Dorkings* both cockerels were large and good, as was the first pullet. In the Variety class the first Houdan was a fine bird if we except his comb; the pullet, also a Houdan, was a beauty. In *Games* *Bantams* the first cockerel was a little gem in every way, second a smart bird with a bad eye. In other colours but *Reds* the winner was a real good bird. In the Variety class first went to well-known Silver-laced, second to *Pekins*, Blacks being highly commended only. The first single cock was a very good Black *Red*, second also a very good bird. In chickens, any colour, the first cockerel was a beautiful *Sabright*, as was the second pullet; the first *Games* pullet being very leggy and neat. In old birds, any breed, first went to Dark *Brahmas* of great merit; second to Buff *Cochins* in bad feather; and third to *Spanish*. This was a good class. In *Aylesbury Ducks*, first were very fine, and the rest good. *Bouzas* were both numerous and good, both the winners being most excellent, as were highly commended (*Unsworth*). *Geese* and *Turkeys* were all capital, but very few.

*Pigeons* were more numerous than poultry. Pouters, however, were poor to commence with. In *Carriers* a good lot, first went to a slashing *Dun*, second was neat in eye and colour. In *Tumblers*, first was good in head, beak, and colour; second, fair. *Long-faces* we did not fancy. In *Owls*, foreign, first went to a little gem of capital quality in head; second also a good Pigeon, as were several unnoticed birds. *English Owls* were very strong and deserved more notice from the Judge. The winner was a lovely Blue of great style and head qualities. *Barbs* were a very

good lot, first being especially nice in skull; second neat Blacks. *Turbits* were not so good throughout, but the winners were good in head and colour. The first *Jacobin* had a capital mane, and was rich in colour. *Antwerps* were a capital lot, some good ones (*Gamon* and *Entwales*) being unnoticed. In *Fantails*, first excellent in carriage; second capital in tail. *Dragoons* were very numerous, and a grand lot indeed, though we should have placed them different. In the variety class were good *Loes*, *Magpies*, and *Swallows*, deserving more prizes.

**BRANDS**.—Cockerel.—1, J. Powell, Bradford; 2, H. Wilkinson, Kirby, Leeds; 3, E. Walton, Sawtwell; 4, J. Thresh, Bradford. Pullet.—1, E. Walton; 2, J. Powell.

**Yates**.  
**GAME BANTAMS**.—Black or Brown.—1, G. Hall, Kendal; 2, W. F. Entwistle, Westfield, Bradford; As, E. Walton, Horcliffe; Any other variety.—1, E. Walton; 2, W. F. Entwistle; As, J. Riley, Ascrington.  
**GAME BANTAMS**.—1, G. Hall; 2, E. Walton.  
**BANTAMS**.—Any other variety except *Gems*.—1, M. Cook, Chorlton; 2, E. R. Smith, Brooklands, Preston; As, A. Smith, Northampton.  
**BANTAMS**.—Cockerel.—1, M. Cook; 2, E. Walton. Pullet.—1, G. Hall; 2, M. Cook.  
**EXTRA PRIZES**.—1, T. J. Ansdell; 2, J. Walker; 3, H. Wilkinson.  
**DUCKS**.—*Aylesbury*.—1, J. Walker; 2, C. Holt, Rochdale; 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.  
**GOOSE**.—*White*.—1, J. Walker; 2, J. Walker.  
**GOOSE**.—*Grey*.—1, J. Walker; 2, T. Mills, Goscombe; 3, G. M. Boyle, Rochdale; 4, T. Mills.  
**TURKEYS**.—1 and 2, J. Walker. Poults.—1, J. Walker.

### BURTON-ON-TRENT SHOW OF POULTRY, &c.

This event came off on Wednesday, August 28th, and was an unprecedented success, the total receipts at the doors amounting to £240, independent of railway tickets and the "permits" of upwards of a thousand subscribers. The weather was favourable throughout the afternoon, but in the morning it was anything but inviting to those residing at a distance from the town. The show of plants, flowers, fruits, and vegetables was of aver-

age merit, several of the departments being well furnished, the fruits and vegetables more especially. To comment on the great attractions of the fête would be to refer to the military concert sustained by the band of Her Majesty's 1st Life Guards and the Burton Rifle band, and to the exhibition of poultry, Pigeons, cage birds, Rabbits, and Cats, and the coopers' competition with casks. The former was a musical treat of high character, and was much appreciated; whilst the coopers' contest, representing one of the chief industries of the town, was a capital speculation, and served the purpose of the Committee most successfully. The poultry, bird, Rabbit, and Cat Show was a "great draw" on the visitors, and the Committee of the Society would do well to make this and the coopers' competition an established institution in connection with one of their fêtes every year. It would then be looked forward to, and intending competitors would consult the arrangement when deciding upon their fixtures; indeed, this is a point worthy of the Committee's notice, the financial result of the late fête—more than £80 in advance of any previous year, being a consideration of no mean importance.

**Cage Birds**, of which there were ten classes, brought about fifty entries, and formed an attractive feature of the Exhibition. Here and there were promising specimens, which, as the season advances, may very likely be heard of again. The Lizard and Mule classes were good in quality, but in the former the number was limited, three entries only having been effected, whilst Mules had eight, some of which were fit for any company. There was a class for Goldfinches and another for "British," as the catalogue specified, which was a strange way of naming the classes. In the Crystal Palace catalogue a Nightingale is eligible for entry under the heading of "Birds of Passage and Migratory Birds;" but at Burton-upon-Trent matters differ somewhat, for Thrushes and a Bullfinch (British birds proper) had to stand back for a Nightingale, which was awarded first honour in the "British" class! There was a Thrush in the class well worthy of a first prize.

Taylor, Burton-on-Trent. 2. W. Kimber. Female. 1. E. Hall, jun., Borough Fields, Walton-on-Trent. 2. E. A. Poole, Great Berkhampstead. 3. T. Weightman.

JUDGES.—Poultry, Pigeons, and Rabbits: Mr. A. O. Worthington, and Mr. Tegetmeier. Birds: Mr. E. Beumrose, Derby. Cats: Mr. Thomas Worthington, Derby.

### GOOD EGGS.

THE old notion that "eggs are eggs" no matter of what variety or how produced, is fast dying out; still there are a great many persons among those who should know better who do not realise the effect of feed upon the quality of the egg.

There is just as much difference between the eggs of fowls allowed to roam and forage for themselves, and those which are fed regularly on good nutritious food, as there is between a leg of good Southdown mutton and that of a common half-starved sheep.

Fowls roaming over the farm and through the stable, expected through the summer months to pick up a living for themselves, eat many things they would not otherwise touch; and this strong rank food affects the taste of the eggs. The same as when a cow eats onions, cabbage or turnips, the milk at once receiving the bad flavour.

Eggs thus tainted in flavour have not the same keeping qualities as those from better-kept fowls. The richer the food the better flavoured and higher coloured the eggs. Wheat and corn, with a little animal food—scraps or cooked lights—twice or three times a week, if the fowls are on a grass run, will produce the best quality of eggs for the table.

If the fowls are confined in a small yard with no access to grass, green food must be provided for them. A small feed daily of chopped grass or clover, with occasionally a head of lettuce or cabbage, will be a great benefit. Buckwheat is good to promote the increase of eggs, but it does not add to their richness. The yolk becomes pale, and if much of this grain is used the eggs are not desirable for pastry, and are unfit for some kinds of confectionery.

Oatmeal and Indian meal mixed and scalded add both to the production and quality of the eggs, but care must be taken not to feed too liberally, or the increase of fat will check the production of eggs.—(*American Pet Stock Bulletin*.)

### A CARRIER PIGEON CAUGHT AT SEA.

CAPT. HOLLIES, of the German ship *Duseberg*, lying at Commercial Wharf, Fell's Point, has on board a Carrier Pigeon which was caught at sea, the ship being on the voyage from Europe for Baltimore. When ten days outside the British Channel, and seven hundred miles from the nearest land, on an afternoon, the captain's attention was attracted to the Pigeon flying near the ship, seemingly quite exhausted. Some food was placed on the deck near the cabin, when the Pigeon came on board and ate greedily. At nightfall it nestled in the shrouds far up on the mainmast, and was taken prisoner by the captain himself. The bird is of the pure Carrier Pigeon breed, with rainbow-hued plumage and a muscular development of body and wings not known to the more common varieties. Beneath the left wing, on one of the large feathers, are imprinted in very plain characters the words, "Du Siège de Paris" (The Siege of Paris).

The letters were evidently put on with a stencil and brush and are one-third of an inch in length. It is possible that this was one of the many Carrier Pigeons employed by the French to take flying trips with packets of information outside the walls of Paris during the memorable siege of that city by the German army. But it is not probable that, becoming lost, it has in all the years since been a fugitive over the land and sea, seeking an abiding place. Capt. Hollies thinks it may have been turned loose from a French mail steamship out on the ocean and started back to Paris, but, becoming tired and hungry, sought food and rest on the *Duseberg*. The captain holds it by right of capture, and prizes his pet more highly than did its French owner, for he will not part with it. The words stamped on the wing may have been placed there during the siege of Paris. All government Carrier Pigeons have a stamp of some kind, and this may have been one of them.

### LIGURIAN BEES.

"A YOUNG APRIAN" wishes some bee-keeper "would give us his experience of the comparative honey-collecting capacities of the pure Ligurians and the common black bees this season, as it would be especially valuable and interesting just now. If it is true that the Ligurian bees collect a third more honey than the common bees in season like this when my bees (the ordinary black bees) have not collected more than enough to keep the hives from losing in weight since the middle of June, we

might reasonably assume that by replacing them with Ligurians we should still have a fair surplus of honey to take in spite of the bad honey harvest."

This is a very natural inquiry on the part of a young apiarian, and we put his question in full with the hope that some of the readers of the *Journal of Horticulture* will kindly favour us with their experience during the present year. An old and experienced apiarian in this locality bought in early spring a strong stock of pure Ligurians with an imported queen. The possession of this stock of pure Ligurians seemed to give him an increase of pleasure and enthusiasm amongst his bees. We were invited to see his new friends, and during the summer months—indeed from their arrival to the present time—we have taken considerable interest in them. They have been narrowly watched by the gentleman and myself with a view to ascertain if they possess any superiority whatever. If they possess any superior qualities we have both failed to discover them. They have not bred more than common bees; they have not gone to the fields earlier in the mornings, nor worked later at nights. When inclement weather kept the common bees at home the Ligurians stayed at home too—very wisely so. No more work has been done by Ligurians, no superiority has been manifested. Most of the stocks of the owner lost weight during the summer; none lost more than the Ligurians.—A. PATTENAW.

### INDIAN HONEY AND WAX.

In a visit to the new Indian Museum at South Kensington I found an interesting corner filled with bee products, and very curious it was to find such a surprising difference in the appearance of both honey and wax to that of European production. Commencing with the honey (which of course I was not allowed to taste), none could compare in colour with moderately good English honey; the nearest approach to it was that from Lohardanga, and the produce of the orange flowers of Bengal. Then we find Coorg exhibiting some dark and dirty-looking stuff; Ava dark brown honey from wild bees, and hill honey quite black, like the very blackest of treacle. It is worthy of remark that most of this honey, especially the darkest, was uncrystallised. Under the same conditions of storage our superior article would have been solid.

Turning to the wax, not a single example exhibited the bright orange colour of good beeswax. The sample from Pegu was of a fair white, and nearly rivalled by that from Bangoon. Travancore's was grey. From the Indian Archipelago came several samples, varying in colour from light to dark chocolate. Others, described as Jungle and Orissa wax, were of a dirty mottled black and white; and Raepore rivalled the honey of the hills, being quite black. One jar's contents was denominated "wax oil," whatever this may be I know not.

Altogether I do not think India would be a successful competitor in either honey or wax at the next Crystal Palace Show. JOHN HUNTER, *Eaton Bisc, Basing.*

### BEEES ON THE MOORS.

To-day (August 28th), I have been visiting my bees on the moors. At the beginning of this month I sent thirty-two hives there; many of them at that time were without any stores, and exceedingly light in the hand. Twenty pounds of sugar were given to them the first ten days after they went to keep the bees alive, the weather being unfavourable. On the 18th or 14th the weather became favourable for honey-gathering, and since then till to-day some of the best hives have gained 40 lbs. in weight each, some 80 lbs, and some 20 lbs. My first swarm weighs 82 lbs.; and my neighbour Mr. Thorpe, whose bees are at the same place, has two swarms weighing 78 lbs. and 70 lbs. respectively. These are the best amongst ours, and if the weather continue favourable for another week they will probably rise to above 100 lbs. each.

In examining some of the hives internally to-day, we could not avoid wondering at the marvellously large yield of honey from the heather in so short a time. The bees and combs seemed to be cumbered with honey—every open cell had some in it—the honey sparkled from the cells amongst the brood in the centres of the hives, and on the crowns and outside combs the bees were storing it away, and sealing it up as fast as they could. But evidently the outdoor workers have been giving the indoor workers too much to do. The cessation of honey-gathering for twenty-four hours would set at liberty more hands for indoor work. In such a time of honey-gathering a day of rain is not a day of rest, but a day of preparation for sunshine and more labour. What industry!—A. PATTENAW.

THE CANADA POULTRY JOURNAL will be published on the 15th of each month, beginning with September, 1876. It will contain twenty pages, two columns on each page; printed on good white

paper, and bound with a coloured cover, at the low price of \$1 per annum, in advance, postage paid.

### OUR LETTER BOX.

**POULTRY LAYING SOFT EGGS (A.).**—As the season is now advanced, and the birds are moulting, separate your two hens from their mates, and perhaps next year they may lay all right. From what you say of their feed and freedom as to flight, there can be no improvement made in any way.

**BURN A HOLLOW TREE (A Young Apiarian).**—By chiselling all the holes and cracks in the tree you may speedily destroy the bees with the fumes of sulphur. Melt some brimstone in a plumber's lead pan, and dip some cotton rag in it; then close all openings in the tree and set fire to the rag below the bees. Powder burnt in the cavity of the tree, or shot from a gun in it, will kill every bee.

**WORKING BEES KILLING OUR ANOTHER (W. M.).**—There must be planks going on among your bees. Some are stinging and have no doubt attacked some more prosperous hive. Shut-up the attacked hive early in the morning for a day, opening towards evening, but taking care to give ventilation. Feed all your weak hives liberally.

**VERMIN ON BOW (G. M., Salisbury).**—Wash her with a strong infusion of tobacco in water, and the next day with soap.

### REMARKS.

25th.—A bright pleasant day; rather windy and cool towards night.  
26th.—Windy in the night; somewhat dull all day, but not unpleasantly so.  
27th.—A very fine day throughout; much cooler towards night.  
28th.—Slight haze in the morning, less in the middle of the day; rain commenced at 5 P.M., and continued all night.  
29th.—Fine early, fair but not fine during the rest of the day, and cloudy night.  
30th.—Heavy at 8 A.M., but soon cleared off; a very pleasant day from 10 A.M., but rather cool.  
31st.—Another very pleasant day; bright all day.  
A very pleasant week—very bright, but by no means hot. The mean temperature at 9 A.M. was slightly below that of the week previous; the mean maximum 9° below it; but the mean minimum in air was the same as last week; and the mean minimum on grass 0.4 above it.—G. J. SYMONS.

### COVENT GARDEN MARKET.—September 1.

PRICES of all kinds of fruit have a downward tendency and no prospect of an alteration. Outdoor Peaches and Nectarines have made their appearance, but are generally small and much punctured by wasps and bees. Several very handsome Cayenne Pines from St. Michael's have arrived this week, but fetched bad prices, there being no demand for heavy fruit.

From observations taken near London during forty-three years, the average day temperature of the week is 67.8°; and its night temperature 46.1°.

## CARNATIONS AND PICOTEEES.

THE same wet weather that had spoilt much hay was also greatly against our Carnation blooms. Buds had to be carefully watched and protected in good time, and such as were not, soon had the outer petals rotted as they rose from the pod. He who would grow a florist's flower must needs have a genuine love for it, and love can always take pains.

Carnations and Picotees are not the least troublesome of florist flowers, but there are so many careful and hearty growers that, weather notwithstanding, we had a very good show at the National. It is impossible to fix such a date as shall suit all members of a large florist society scattered over a wide area. We can be national in name, sympathies, and numbers, but never so in one general exhibition. Climate inexorably divides us into north and south; and in the northern counties even subdivides us. So, in the proposals for date of next year's show, taking Yorkshire opinion only as showing how they differ, there was the range of a whole fortnight given in. The first week in August would be a very safe time and suit a large breadth of district; and I am speaking without any partiality towards my own, because my Carnations and Picotees are never at their best till the third week in August, so hopelessly late that I gave my vote—perhaps to spite them—for the earliest date—August 4. The latest proposed was August 18, and the date finally arranged for the Show of 1876 is August 11. Had this year's Exhibition been held a week earlier there was a wide belief that greater competition and better flowers would have been produced. We should then have seen, what has never yet been accomplished, a stand of twenty-four staged by one exhibitor, and the whole of them his own seedlings. As it was, twenty-two out of Mr. Simonite's twenty-four were his seedlings, but his bloom was at its best when I saw it ten days before the National. The judging in the leading class was not easy work. In several stands the twelve Carnations did not support their companion twelve Picotees, or *vice versa*. The Carnations in Mr. Bower's stand were bright blooms, full of life, but his Picotees were by no means equal to them, or to some in lower places. Mr. Simonite's Picotees were splendid in all great properties of the Picotee, but his Carnations were unable to back them up, through being past their best.

No one has such fair and honest reason to be proud of his work with seedling Carnations and Picotees as my friend Mr. Simonite of fiery awful Sheffield. It was almost a new wonder of the world to see how for the Royal visit the other day that red-hot town cooled down, how her one stern industry of steel and iron was hushed and laid aside, and her great smoke passed away till the air in Sheffield was almost as bright and pure as the breath of country villages. The whole place was changed, and largely by the influence of flowers, many of which, and plants also, were expressly brought from continental
